

Wildfire statistics for England

2009-10 to 2016-17

Summary

- This Forestry Commission England *Wildfire Statistics for England, 2009-10 to 2016-17* provides the results of analysis of all wildfire incidents attended by the Fire and Rescue Services in England, in these eight financial years. We report statistics for:
 - a. wildfires in total, and for two main sub-categories of wildfire, namely;
 - b. woodland fires¹;
 - c. non-woodland fires (i.e. wildfires on other land cover classes).
- Our main findings are that:
 1. Fire and Rescue Services attended almost 260,000 wildfire incidents in England in this eight year period (an average of about 32,000 incidents per annum). Weather conditions are likely to have had a significant impact on wildfires incidents in England.
 2. Woodland fires and those on arable land accounted for more 'primary' wildfires² incidents than any of the other land cover types.
 3. In total the great majority of land area burnt by wildfire incidents was arable, improved grassland, semi-natural grassland, or mountain, heath and bog (open habitats); accounting for over 70% of the burnt area each year.
 4. Woodland fires accounted for 11 to 15% of the number of incidents, and between 1% and 5% of land area burnt by wildfires in England in this eight year period (about 34,000 incidents in total).
- This is based upon analysis of Home Office's Incident Recording System (IRS) data, compared in a geographical information system with the following geospatial data:
 - a. Forest Research's National Forest Inventory (NFI) woodland map;
 - b. The Centre for Ecology and Hydrology's Land Cover Map (LCM).
- Definitions of the terms used in this report can be found in the Methodology section and the Glossary. Contacts for further information are listed the back page.

Cover photograph: Swinley Forest, South East England, 2011 (Photo credit: Rob Gazzard)

¹ Woodland fires are defined as those taking place within woodland as shown on the Forest Research National Forest Inventory (NFI) woodland map; see Methodology section on pages 54-57.

² 'Primary' wildfires are defined in the Methodology section.

Introduction

- Welcome to the Forestry Commission England's *Wildfire Statistics for England, 2009-10 to 2016-17* that provides the results of analysis of all wildfire incidents attended by the fire and rescue services in England, in these eight financial years. We report statistics for:
 - wildfires in total, and for two-sub-categories of wildfire, namely;
 - a. woodland fires³;
 - b. non-woodland fires (i.e. wildfires on other land cover classes).We also report statistics for further sub-categories of woodland (such as broadleaf woodland), and separate land cover classes (such as arable land), respectively.
- This has been made possible by our analysis of incident data for all wildfires we have drawn from the Home Office's Incident Recording System (IRS), when compared in a geographical information system with the following geospatial data:
 - a. Forest Research's National Forest Inventory (NFI) woodland map data to identify woodland fires;
 - b. The Centre for Ecology and Hydrology's Land Cover Map (LCM) data, in places combined with Ordnance Survey's MasterMap[®] data, to identify non-woodland fires on other land cover classes.
- This report provides overview, summary and detailed statistics on the number, area burnt, duration, and location of wildfires. The findings are reported in a series of tables with key equivalent data also visualised in adjacent bar charts. The locations of the wildfire incidents are shown in a series of maps.
- Wildfires, including woodland fires, and wildfires on other land cover types, are uncontrolled vegetation fires. Although they can start naturally, the majority are caused by people, either accidentally or deliberately. Wildfires can impact on transport network and power lines, damage property and businesses, affect tourism and recreation, and threaten people's lives. They also damage the natural and historic environment and release carbon dioxide stored in vegetation and soils which contributes to climate change. There is potential for destructive wildfire events to increase in frequency in the UK due to increased land-use pressure and climate change. This report brings timely information to light to help government and key stakeholders consider appropriate responses and guide planning.
- This report is the latest step by Forestry Commission England to deliver key factual information on wildfires to inform decisions on policy and practice. Work has included supporting the Department of Communities and Local Government (DCLG) in 2008 to develop the wildfire element of the new Incident Recording System (IRS) that now provides a record of the nature of incidents requiring a response by the Fire and Rescue Services. To do this we developed the United Kingdom Vegetation Fire Standard (UKVFS), a series of data fields across all vegetation types, that now provides a standardised approach to the reporting of

³ Woodland fires are defined as those taking place within woodland as shown on the Forest Research National Forest Inventory (NFI) woodland map; see Methodology section on pages 54-57.

the context, management and consequences of wildfires and controlled burning (Gazzard, 2009)⁴. Since 2016 the responsibility for Fire Statistics was taken on by the Home Office, and their analyses includes that of 'outdoor' fires, but not 'wildfires', so Forestry Commission England agreed to conduct this analysis and reporting. The UKVFS was used to help form the wildfire data fields in what is now the Home Office's online Incident Recording System (IRS), that Fire and Rescue Services populate to provide records about wildfires (and other) incidents.

- Data on wildfires collected in the IRS has been analysed by Forestry Commission England Evidence and Analysis team since then. As a result summaries have been published in *Forestry Statistics* (Forest Research, 2018 and previous years)⁵, and provided for the European Union's Joint Research Centre (JRC) science and knowledge service. Detailed statistics have been provided to, and published by, the Fire and Rescue Statistics User Group (FRSUG)⁶.
- The intended audience of this report is analysts and those with a policy or practical interest in wildfire who have some experience of interpreting statistics and maps. It has been produced to inform Defra and Natural England on matters such as the uplands and wildfires in other landscapes. It has also been produced to inform the UK Parliamentary Office of Science and Technology current assessment of climate change and wildfire frequency.

Key findings

- This statistical release presents statistics for wildfire incidents attended by the Fire and Rescue Services (FRS) in England for the eight financial years 2009-10 to 2016-17 inclusive. There are statistics for England on wildfires in total, and the following main sub-categories: woodland fires, and non-woodland fires (on other land cover classes). The key findings are:
 - **Fire and Rescue Services attended almost 260,000 wildfire incidents in England in this eight year period (an average of about 32,000 incidents per annum).** This involved around 37,000 hectares of land being burnt in the eight years (an average of about 4,600 hectares per annum), and the incidents had a total duration of just over 300,000 hours (an average of about 38,000 hours per annum). The greatest number of incidents, area burnt and duration were each in 2011-12 (almost 50,000 incidents, over 14,000 hectares burnt and a total duration of 60,000 hours). The smallest number of incidents, area burnt and duration was in 2016-17 (about 21,000 incidents, 2,200 hectares burnt and a total duration of 25,000 hours).
 - **Weather conditions are likely to have had a significant impact** on wildfires incidents in England. The increase in wildfire number and area burnt in 2010, 2011 and 2012 correlates with the drought of the same period in central, eastern and southern England and Wales as well as heat wave alerts⁷.
 - **'Primary' wildfires took place on a wide range of land cover classes in this eight year period.** Woodland fires and those on arable land accounted for more primary wildfires than any of the other land cover types (about 2,500 and 4,800 primary wildfire incidents respectively out of a total of about 15,000). This meant woodland fires accounted for between 11% and 25% (2011-12) of primary wildfires per annum in this period, and wildfires on arable land accounted for between 28% and 41% (2012-13) of primary wildfires per annum in the period.
 - **National Operational Guidance Programme (NOGP)-defined wildfire incidents totalled 7,141 incidents** in these eight years⁸.
 - **The majority of NOGP wildfire incidents, and wildfires incidents as a whole, were categorised as 'small' (under 1 hectare)** on the UK Vegetation Fire Size categorisation, with nearly all the rest medium sized (under 50 hectares). There were fewer large and very large incidents. There were 5 'landscape scale' (greater than 1,000 hectare) wildfire incidents in the 3-year 2009-10 to 2011-12 period, but none in the other years.

⁷ Source: Met Office (2013) See: <https://www.metoffice.gov.uk/climate/uk/interesting/2012-drought>

⁸ See definition of National Operational Guidance Programme (NOGP) wildfires in Methodology section.

- **Wildfire incidents took place on sites with a natural environment designation in every year in this eight year period.** The largest number of incidents were on Sites of Special Scientific Interest (SSSIs, an average of 880 per annum), but there were also many in National Parks (an average of 370 per annum), Special Protection Areas (SPAs, an average of 360 per annum), Special Areas of Conservation (SACs, an average of 330 per annum) and Ramsar sites (an average of 150 per annum). FRS attended over 7,000 wildfire incidents in this eight year period on SSSI accounting for around 10,000 hectares of land burnt, with a duration of about 19,000 hours in total.
- **Wildfires as a whole (including both woodland fires, and non-woodland fires -- on other land cover types) took place on a wide range of land cover types.** The land cover type with the most incidents was **built-up areas and gardens** with around half the total number of incidents each year (128,000 incidents in total over the eight years).
- **Woodland fires accounted for 11 to 15% of the number of incidents** in this eight year period (about 34,000 incidents in total). Improved grassland (16 to 17 % per annum, 44,000 incidents in total) and arable land (9 to 14%, 32,000 incidents in total) also accounted for larger percentages of the number of wildfire incidents each year.
- **The great majority of land area burnt by wildfire incidents was i) arable, ii) improved grassland, iii) semi-natural grassland, or iv) mountain, heath and bog (open habitats);** accounting for over 70% of the burnt area each year. In 2011–12 these four land cover categories accounted for 95% of the burnt area equating to over 12,000 hectares of land (and mainly on mountain, heath and bog), out of a total area burnt by wildfire of 14,043 hectares that year.
- **Woodland fires typically accounted for between 1% and 5% of land area burnt by wildfires in England** in most of years in this period, equating to a range from 33 hectares in 2016-17 to about 105 hectares in each of 2013-14 and 2014-15. In 2010-11, however, woodland fires accounted for much more of the total; namely 12% of the area of land burnt by wildfire in England, equating to 1,107 hectares out of the total of 8,281 hectares that year.

Notes to Table 8:

1. Source: Home Office Incident Recording System data for financial years 2009-10 to 2016-17.
2. 'Primary' fires are generally more serious fires that harm people or cause damage to property. They are defined as fires that cause damage and meet at least one of the following conditions: any fire that occurred in a (non-derelict) building, vehicle or (some) outdoor structures, any fire involving fatalities, casualties or rescues, any fire attended by five or more pumping appliances.
3. See the Methodology section on pages 54-57 for description of how wildfires were categorised as woodland fires or non-woodland fires, and to Interpreted Forest Types of woodland, and separate land cover classes.
4. The 'Other' land cover class* = Coastal, freshwater and saltwater land cover classes aggregated.

Figure 8: 'Primary' Wildfires by Land Cover Class.

The 'Other' land cover class* = Coastal, freshwater and saltwater land cover classes aggregated.

Map 5: Wildfire Incidents by Selected Land Cover Type

Annex 1: Methodology

Definitions: Wildfires, woodland fires and non-woodland fires

- **Forestry Commission England definition of a wildfire:** For the purposes of the analyses included in this report we have defined a **wildfire** incident as:

'Any uncontrolled vegetation fire which requires a decision, or action, regarding suppression.'

- This definition is taken from the Scottish Government's *Fire and Rescue Services Wildfire Operational Guidance*⁹.
- **National Operational Guidance Programme (NOGP) fires:** The National Operational Guidance Programme uses the same definition for wildfire as this except that NOGP wildfires are differentiated from smaller incidents if they meet one or more of the following criteria:
 - a) *It involves a geographical area of at least one hectare (i.e. at least 10,000 square metres)*
 - b) *It has a sustained flame length of more than 1.5 metres*
 - c) *It requires a committed resource of four or more fire rescue service appliances*
 - d) *It requires resources to be committed for six or more hours*
 - e) *It presents a **serious** threat to life, environment, property and infrastructure*

There is more at <https://www.ukfrs.com/guidance/wildfires>.

- Since the data available for our analyses can only identify criteria a), c) and d), these criteria have been used to identify wildfires the NOGP definition.
- **Primary fires:** Primary fires are potentially more serious fires that harm people or cause damage to property and meet at least one of the following conditions:
 - a) *any fire that occurred in a (non-derelict) building, vehicle or (some) outdoor structures*
 - b) *any fire involving fatalities, casualties or rescues*
 - c) *any fire attended by five or more pumping appliances.*

⁹ The Scottish Government (2013) *Fire and Rescue Service Wildfire Operational Guidance*, available at <https://www2.gov.scot/Publications/2013/10/6118>. Edinburgh: Scottish Government, 362p.

- **Woodland fires:** In the National Forest Inventory of Great Britain, compiled by Forest Research 'woodland' is defined as:

'An area of trees of at least 0.5 hectare in extent and a minimum width of 20 metres, with at least 20% canopy cover, or potential to achieve this.'

- This woodland is shown on the National Forest Inventory woodland map and we have used this geospatial data to identify which out of all wildfires are 'woodland fires'. This was achieved using a geographical information system (GIS); in this case ESRI's ArcGIS. This NFI definition of woodland for Great Britain is akin to the international definition of woodland. Therefore information about 'woodland fires' in this national report for England, can be used in comparison with the reports for other countries around the world on '**forest fires**'.
- Sub-categorisation of woodland fires used the *Interpreted Forest Types* provided in the National Forest Inventory woodland map geospatial data. This typology is derived from analysis of the remote sensing and topographic geospatial data, including heads-up interpretation of aerial photography of the woodlands themselves.
- **Non-woodland fires:** After having first identified 'woodland fires' as above, we have considered all other wildfires to be 'non-woodland fires'.
- Sub-categorisation of non-woodland fires used the *Land Cover Classes* in the Land Cover Map geospatial data from the Centre for Ecology and Hydrology (CEH). This is the primary, well regarded and well established geospatial dataset on land cover that includes all of England. Again this analysis was achieved using ESRI's ArcGIS desktop software.

Data sources and how they were used to categorise the wildfires

- **Wildfires:** Data on the nature and location of wildfire incidents was provided by the Home Office as an extract from the Incident Recording System (IRS), which is a record of all incidents attended by Fire and Rescue Services (FRSs) in England. This data provided by Deborah Lader of the Fire Statistics section in the Home Office's Analysis and Insight Directorate covered the eight financial years 2009-10 to 2016-17. The dataset provided an extract of variables (i.e. attributes) for wildfires.
- **Woodland and types of woodland:** Land was identified as woodland using the National Forest Inventory (NFI) woodland map at 31 March 2016 (Forest Research)¹⁰. This was the most recent version of the data available at the time of analysis. We used it's attributes to identify Interpreted Forest Types.

¹⁰ There is more on the National Forest Inventory on the Forest Research website at: <https://www.forestresearch.gov.uk/tools-and-resources/national-forest-inventory/> and the latest National Forest Inventory woodland map is available for download as geographical data from the Forestry Commission map-based Open Data website at <http://data-forestry.opendata.arcgis.com/>.

Annex 1 Table A: National Forest Inventory Interpreted Forest Types

Code	National Forest Inventory Interpreted Forest Types
B	Broadleaved Woodland
C	Conifer Woodland
Mb	Mixed Woodland - Predominantly Broadleaved
Mc	Mixed Woodland - Predominantly Conifer
O	Coppice
N	Young Trees
Ld	Low Density
Aw	Assumed Woodland
G	Ground Prepared For Planting
S	Shrub land
F	Felled
X	Uncertain

- Non-woodland land cover classes:** After land had been identified as woodland, all remaining land was classified into land cover classes according directly the way it was shown in Land Cover Map geospatial data from the Centre for Ecology and Hydrology (CEH). The GIS analysis used both:
 - Land Cover Map 2007
 Copyright notice: LCM2007 © and database right NERC (CEH) 2011.
 More at: <https://www.ceh.ac.uk/services/land-cover-map-2007>
 - Land Cover Map 2015

- After land had been first identified as woodland, some areas of the remaining 'non-woodland' were seen to be in the Land Cover Map 'woodland' class. While we couldn't consider these as formally woodland for the reported results, we conducted supplementary analysis to establish which of them could be considered as covered with trees and akin to woodland. This was achieved using an additional dataset that includes relevant land cover information across entire the country, namely Ordnance Survey's MasterMap® topographic layer (as at

November 2014)¹¹. From this we identified these sub-classes within the Land Cover Map 'woodland' class:

- a. Woodland (verified in OS MasterMap®);
- b. Non-Woodland (as not verified in OS MasterMap®).

This doesn't mean there was any error in the way Land Cover Map identified its 'woodland' class. Rather it simply shows the different data sources, methodology and definitions applied. As mentioned, we have chosen to use primarily the National Forest Inventory woodland map geospatial data to identify woodland, as this is to the formal definition of woodland for Great Britain and provides more detail on the Interpreted Forest Types of woodland (such as *Broadleaved Woodland*).

- In some cases land cover types were aggregated to aid interpretation; e.g. to *Arable*. Wildfires that were located in Land Cover Map classes *Freshwater*, *Saltwater* and *Coastal* were aggregated into a new category named *Other* in our tables, charts and maps. We used the most recent version of the Land Cover Map geospatial data available to us at the time of computations.

Annex 1 Table B: Land Cover Map Classes (and disaggregation of LCM Woodland class)

Code	Land Cover Map Classes (and disaggregation of LCM <i>Woodland</i> class)
WL	Woodland (verified in OS MasterMap®)
N-WL	Non-Woodland (as not verified as woodland in OS MasterMap®)
A	Arable
IG	Improved Grassland
SG	Semi-Natural Grassland
MH&B	Mountain, Heath & Bog
B&G	Built-Up Areas & Gardens
Other*	Coastal, Freshwater and Saltwater land cover class figures aggregated

Annex 2: Glossary

Term	Meaning
Hectare (Ha)	Unit of area equivalent to 100 metres x 100 metres = 10,000 square metres. 1 hectare = 2.47 acres.
Fire and Rescue Service (FRS)	The local service providing emergency cover. There were 45 FRSs in England at 31 March 2017.
Incident Recording System (IRS)	An online system containing records of incidents attended by the Fire and Rescue Services (FRSs).
Mean (i.e. average)	The arithmetic mean is the average of a set of values computed as the sum of all values divided by the count of all values. It is one possible measure of the central tendency in a set of data.
Median	The median is the central value when all values in a set of data are placed in rank order from greatest to least. It is one possible measure of the central tendency in a set of data.
National Forest Inventory (NFI)	An inventory compiled by the Forestry Commission, set up in 2009, to provide a record of key information about GB forests and woodlands.
National Forest Inventory woodland	An area of trees of at least 0.5 hectare in extent and a minimum width of 20 metres, with at least 20% canopy cover, or potential to achieve this.
National Forest Inventory woodland map	This is a map layer suitable for use in geographical information systems that shows the location and extent of National Forest Inventory woodland (see above). It is available as Open Data from Forest Research.
National Park	National Park authorities conserve and enhance the natural beauty, wildlife and cultural heritage of land in National Parks, and promote opportunities for the understanding and enjoyment of their special qualities. The UK's 15 National Parks are: The Brecon Beacons, Broads, Cairngorms, Dartmoor, Exmoor, Lake District, Loch Lomond and Trossachs, New Forest, Northumberland, North York Moors, Peak District, Pembrokeshire Coast, Snowdonia, South Downs, and Yorkshire Dales.
Ordnance Survey (OS) MasterMap®	Ordnance Survey (OS) MasterMap® is the definitive source of highly-detailed geographic data of Great Britain. It is offered in layers – topographic, imagery, and networks.
Ramsar sites	These are wetlands of international importance, named after the city of Ramsar in Iran where the related international treaty was adopted.
Range	The range in a set of data values is the difference between the minimum value and the maximum value of that set. It is one possible measure of dispersion in a set of data.

Term	Meaning
Sites of Special Scientific Interest (SSSI)	A Site of Special Scientific Interest (SSSI) is the land notified as an SSSI under the Wildlife and Countryside Act (1981), as amended. SSSI are the finest sites for wildlife and natural features in England, supporting many characteristic, rare and endangered species, habitats and natural features.
Special Area of Conservation (SAC)	These are high quality conservation sites strictly protected under the European Community Habitats Directive. The aim is they will make a significant contribution to conserving particular habitat types and species most on need of conservation, and as identified in the Directive. A full list of SACs in the UK is available from the Joint Nature Conservation Committee (JNCC) at http://jncc.defra.gov.uk/page-1458
Special Protection Area (SPA)	These are strictly protected sites classified under Article 4 of the European Community Birds Directive. They are classified for rare and vulnerable birds, and for regularly occurring migratory bird species, and as listed in the Directive. A full list of those in the UK is available from the Joint Nature Conservation Committee (JNCC) at http://jncc.defra.gov.uk/page-1400
Standard deviation	The standard deviation of a set of data can be seen as the average amount a value differs from the mean of that set of data. It is one possible measure of dispersion in a set of data.
