Air Quality Annual Report 2018

gov.uk/hs2

Department for Transport

High Speed Two (HS2) Limited has been tasked by the Department for Transport (DfT) with managing the delivery of a new national high speed rail network. It is a non-departmental public body wholly owned by the DfT.

Non-technical summary

This 2018 Annual Air Quality Report focusses on monitoring undertaken in the 2018 calendar year during construction works on Phase One of HS2.

The High Speed Two project (HS2) is the Government's proposal for a new, high speed, north-south railway. HS2 Phase One will connect London with Birmingham and the West Midlands; Phase Two will extend the route to Manchester, Leeds and beyond.

In November 2013, HS2 deposited a Hybrid Bill with Parliament to seek powers for the construction and operation of Phase One of HS2 (referred to as 'the Proposed Scheme'). The results of the Environmental Impact Assessment were reported in an Environmental Statement which was submitted alongside the Bill. On 23 February 2017 Royal Assent was granted for HS2 Phase One, creating the High Speed Rail (London – West Midlands) Act 2017.

The HS2 Air Quality Strategy and HS2 Phase One Information Paper E31: Air Quality summarises the air quality effects identified in the Phase One Environmental Statement, as amended, and set out HS2's approach for managing air quality, which includes the publication of an annual review of air quality.

The first two annual reports published in 2018 (revised in 2019) focused on reporting monitoring data for air quality around highways and covered the 2016 (based on 6 months of monitoring data), and 2017 calendar years. These reports reviewed baseline conditions prior to the commencement of construction works.

This third annual report is focused on reporting monitoring data for air quality around highways, covering the 2018 calendar year during the early stages of construction activity. The report makes reference to the air pollutants and areas where significant effects were identified within the Environmental Statement, as amended. These significant effects are confined to a limited number of roads in the Greater London area and the significant effects are for the pollutants nitrogen dioxide and particulate matter. Therefore, the monitoring data discussed in this report only covers the Greater London area and the pollutants nitrogen dioxide and particulate matter.

HS2 commenced a baseline air quality survey at the end of June 2016. This survey uses diffusion tubes to monitor nitrogen dioxide. The monitoring and reporting of this survey has been undertaken following the Department for Environment, Food and Rural Affairs (Defra) Local Air Quality Management best practice guidance. The results from this survey for 2018 are presented in table format in Appendix D and shown on maps, with monitoring sites colour coded based on the measured concentration, in Appendix G. Particulate matter monitoring around highways is available from sites operated by Defra or local authorities and a reference to the relevant reports, where this data is available, is provided. HS2 is undertaking monitoring of indicative particulate matter for the purposes of the management of dust emissions at high and medium dust risk construction sites.

The HS2 air quality monitoring survey is intended to supplement air quality monitoring that is being undertaken by other parties such as Defra, local authorities and in some areas communities and

academic institutions. Data from air quality monitoring surveys undertaken by other parties is not reproduced within this report.

This report provides a summary of the significant effects identified in the Environmental Statement, as amended, and a comparison of 2018 monitoring data with the predictions from the air quality modelling undertaken for the Environmental Statement.

During 2018 the Proposed Scheme was in in the early stages of construction. HS2 have already made commitments for measures to reduce emissions generated by construction activities. The measures include:

- Construction vehicle emission standard requirements and methods to manage their use via traffic management plans;
- Non-Road Mobile Machinery emission standard requirements; and
- Dust mitigation measures.

The Phase One Information Paper E31: Air Quality sets out the HS2 emission standards for construction vehicles and Non-Road Mobile Machinery. The construction vehicle standards came into effect on 14 September 2017 with the commencement of early works, including ground investigation surveys, land preparation works, ecological surveys, etc.

Progress and impact of measures to improve air quality during 2018 are set out in Section 4.2 and will be reported in future annual reports. HS2 continues to monitor air quality in line with the Local Air Quality Management requirements as set out in the HS2 Phase One Code of Construction Practice. HS2 has also been liaising with relevant local authorities that are introducing Clean Air Zones. Furthermore, HS2 has published an Air Quality Action Plan outlining the commitments made, and progress thereof in the management of the significant effects identified in the Environmental Statement, as amended.

1 Introduction

1.1.1 High Speed Two (HS2) is the Government's proposal for a new, high speed national railway. HS2 Phase One will connect London with Birmingham and the West Midlands; with Phase 2 planned to extend the route to Manchester, Leeds and beyond.

1.1.2 The high speed railway project is in 3 phases:

- Phase One: London to the West Midlands;
- Phase 2a: West Midlands to Crewe; and
- Phase 2b: West Midlands to Leeds, Crewe to Manchester.

1.1.3 In November 2013, HS2 deposited a Hybrid Bill[1] with Parliament to seek powers for the construction and operation of Phase One of HS2. Royal Assent was granted for Phase One in February 2017. The results of the Environmental Impact Assessment (EIA) were reported in an Environmental Statement (ES), as amended, which was submitted alongside the Bill, which resulted in the Secretary of State publishing the Environmental Minimum Requirements (EMRs) including the Code of Construction Practise (CoCP), which sets out the environmental and sustainability commitments that will be observed during the construction of the Proposed Scheme.

1.1.4 1.1.4 The ES, as amended, prepared as part of the Bill included an assessment of the impacts of the Proposed Scheme on air quality during both construction and operation. The HS2 Air Quality Strategy and HS2 Phase One Information Paper E31: Air Quality summarises the impacts identified in the ES, as amended.

1.1.5 The High Speed Rail (West Midlands - Crewe) Bill ('the Bill') was submitted to Parliament together with an ES ('the main ES') in July 2017. If enacted by Parliament, the Bill will provide the powers to construct, operate and maintain Phase 2a of HS2. Following the deposit of the Bill, the need for a number of amendments to the scheme (i.e. changes that require amendments to the Bill) was identified. These amendments were promoted in Parliament in March 2018 through an Additional Provision (referred to hereafter as 'AP1'), together with an ES ('the AP1 ES'). The AP1 ES was accompanied by a Supplementary ES ('the SES1'), which reported changes to the design which do not require amendments to the Bill, changes to construction assumptions, new environmental baseline information and corrections to the main ES. AP2 was submitted Feb 2019 and at the time of drafting this action plan was currently ongoing parliamentary process with view of gaining royal assent by end 2019.

Phase 2b Hybrid Bill and associated ES are due to be submitted to parliament in mid-2020.

[1] The High Speed Rail (London – West Midlands) Bill, hereafter 'the Bill'.

1.1.6 This 2018 Annual Air Quality Report focusses on monitoring undertaken in the 2018 calendar year during construction works on Phase One of HS2.

1.1.7 One of the key impacts, identified in the ES, as amended, were the impacts from construction traffic and highway interventions. These impacts were predicted to result in temporary significant effects, along a limited number of roads within the Greater London Area, on local air quality. These effects are mostly from changes in nitrogen dioxide (NO_2) concentrations, and to a much less extent from variations in particulate matter (PM_{10}).

1.1.8 The identified significant effects are largely as a result of the existing concentrations of air pollutants within the Greater London area already being above government air quality standards in London.

1.2 Management of air quality

1.2.1 The HS2 Air Quality Strategy and HS2 Phase One Information Paper E31: Air Quality set out HS2's approach for managing air quality.

1.2.2 In order to manage significant impacts related to highway traffic changes and interventions, HS2 committed to putting in place a process to manage those impacts through measurement and regular assessments of air quality during the construction of the Proposed Scheme. Where significant effects are predicted, action plans will be put in place with the objective of removing those significant effects.

1.2.3 This Air Quality Action plan (published in June 2019), is the first report that presents all the measures HS2 has committed to provide in relation to air quality, forming the baseline against which performance is compared in future years of construction and operation.

1.2.4 The management process is modelled on Defra's Local Air Quality Management (for which the statutory duties of local authorities and London boroughs are set out in Part IV of the Environment Act 1995), and the periodic reviews and action plans are envisaged as being similar to those produced in that process.

1.2.5 The management process comprises of: measure – review – action plan. Baseline (pre-works) air quality monitoring is being undertaken in locations where potential significant effects have been predicted. Forecast baseline and 'with HS2 construction' traffic numbers used in the air quality modelling for the ES will be reviewed and updated in these locations, if necessary.

1.2.6 The baseline measurements will be reviewed and an air quality assessment produced at appropriate stages of construction to determine whether significant effects are still predicted. Where significant effects are still predicted, the air quality monitoring will be continued, and an air quality action plan be developed, with the objective of removing the significant effects as soon and as far as practicable.

1.3 Purpose of this report

1.3.1 The first two HS2 reviews of air quality were published in 2018 and focused on reporting monitoring data for air quality around highways for the 2016 (based on 6 months of monitoring data) and 2017 calendar years. These reports reviewed baseline conditions prior to the commencement of construction works[2].

1.3.2 This third air quality review is focused on reporting monitoring data for air quality around highways, covering the 2018 calendar year during the early stages of construction activity. The report provides a comparison with the information previously presented in the main ES air quality chapter.

1.3.3 This annual report is focused on reporting monitoring data for air quality around highways. The air pollutants considered in this report are NO_2 and particulate matter. The area of focus is where significant effects were identified within the ES. These areas were within Greater London and as such the reporting of monitoring data is for Greater London only. For other areas along the Phase One route, data from Defra and local authority monitoring surveys provides an indication of baseline. This data is not reproduced in this report and reference should be made to the relevant Defra and local authority publications and websites.

1.4 Summary of significant effects identified in the environmental statement

1.4.1 For the ES, calculations of changes in concentrations of NO_2 and PM_{10} were calculated. $PM_{2.5}$ concentrations were considered but not calculated or reported in the ES. The ES predicted that changes in traffic emissions during construction of the Proposed Scheme would give rise to significant effects from changes in annual mean NO_2 concentrations around certain construction traffic routes in the Greater London area. Significant effects from changes in the 24-hour daily mean PM_{10} concentrations were also predicted, but this was limited to the area in the immediate vicinity of Euston Road.

1.4.2 For the ES, best practice guidance published by the Institute of Air Quality Management (IAQM) was used to determine if there were significant impacts anticipated for air quality. This guidance determines the significant effect based on the change in pollutant concentration due to the Proposed Scheme relative to pollutant concentration for the existing (baseline) situation. Where the existing air quality is already above government air quality standards, a relatively smaller change in pollution concentration is considered to be a significant effect, than where existing air quality is below government air quality standards.

1.4.3 Where an effect on air quality is described as significant at a particular location, with respect to the air quality legislation, this does not denote a significant effect on human

[2] In some areas, survey work and ground investigation works were undertaken during 2016/2017. In addition, in the London Borough of Camden construction of housing to replace that which will be lost due to land required by HS2 was under construction during 2016/2017.

health. Much larger changes in air quality than what is predicted as a consequence of the Proposed Scheme would be needed to cause significant impacts on health at the level of an individual person.

1.4.4 A summary of the number of receptors with significant effects predicted in the ES is presented in Appendix A.

2 Air Quality monitoring data and comparison with air quality objectives and national compliance

2.1 Pollutants

2.1.1 The pollutants NO_2 and particulate matter are considered in this annual report. Further details of each of these pollutants is given below.

Nitrogen dioxide (NO_2)

2.1.2 Nitrogen dioxide (NO_2) is a secondary pollutant produced by the oxidation of nitric oxide (NO). NO and NO_2 are collectively termed nitrogen oxides (NO_x). Almost a third of the UK NO_x emissions are from road transport. The majority of NO_x emitted from vehicles is in the form of NO, which oxidises rapidly in the presence of ozone (O_3) to form NO_2. In high concentrations, NO_2 can affect the respiratory system and can also enhance the response to allergens in sensitive individuals, whereas NO does not have any observable effect on human health at the range of concentrations found in ambient air. Elevated concentrations of oxides of nitrogen can have an adverse effect on vegetation, including leaf or needle damage and reduced growth. Deposition of pollutants derived from oxides of nitrogen emission contribute to acidification and/or eutrophication of sensitive habitats.

Particulate Matter

2.1.3 The principal sources of particles in the UK are combustion processes, which include traffic and industry. Particulate matter in vehicle exhaust gases consists of carbon nuclei onto which a wide range of compounds are absorbed. These particles have an effective aerodynamic diameter of less than 10 micrometres (µm). Particles in this size range are referred to as PM_{10}. Finer size fractions are referred to as $PM_{2.5}$. These particles have an effective aerodynamic diameter of less than 2.5µm. Diesel engines produce the majority of particulate emissions from the vehicle fleets. Approximately a fifth of primary PM_{10} emissions in the UK are derived from road transport. Particulate matter are associated with a range of symptoms of ill health including effects on the respiratory and cardiovascular systems, on asthma and on mortality.

2.2 Summary of relevant legislation

2.2.1 Air quality monitoring data has been compared against limit values and objectives set out in the following legislation:

- The Air Quality (England) Regulations 2000[3], Air Quality (England) (Amendment) Regulations 2002[4], the Air Quality Standards Regulations 2010[5] and the Air Quality Standards (Amendment) Regulations 2016[6]; and
- Directive 2008/50/EC on Ambient Air Quality and Cleaner Air for Europe[7].

2.2.2 Air quality limit values and objectives are quality standards that have been set for clean air and to protect human health. Some pollutants have standards expressed as annual average concentrations and others have standards expressed as 24-hour, 1-hour or 15-minute average concentrations. Some pollutants have standards expressed in terms of both long-term and short-term concentrations.

2.2.3 Table 1 sets out the EU air quality limit values and UK national air quality objectives for the pollutants NO_2 and PM_{10} for which significant effects were identified. $PM_{2.5}$ is also included for completeness. Within this report, the term 'air quality standards' refers to both the English air quality objectives and the air quality limit values introduced in the UK based on EU Directives.

Table 1 – Relevant air quality standards

Pollutant	Averaging Period	Air Quality Standards
Nitrogen dioxide (NO_2)	1-hour mean	200 µg/m^3 not to be exceeded more than 18 times a year
	Annual mean	40 µg/m^3
PM_{10}	24-hour mean	50 µg/m^3 not to be exceeded more than 35 times a year
	Annual mean	40 µg/m^3
$PM_{2.5}$	Annual mean	25 µg/m^3 to be achieved by 2020
	3-year mean	Target of 15% reduction in concentration at urban background locations to be achieved between 2010 and 2020.

2.3 Summary of monitoring undertaken by HS2

2.3.1 All HS2 air quality monitoring surveys are intended to supplement air quality monitoring that is being undertaken by other parties such as Defra, local authorities and in some areas communities and academic institutions. Data from surveys undertaken by other parties is not reproduced within this report.

2.3.2 HS2 commenced a baseline air quality survey at the end of June 2016 in locations where there were predicted to be significant effects on air quality around highways. This baseline air quality survey measured annual mean NO_2, for which potential significant effects were predicted around certain construction traffic routes in the Greater London area. This survey has continued throughout the initial enabling works phase and will be continued into the main works construction phase.

2.3.3 In relation to where significant effects were identified for PM_{10} for air quality around highways, supplementary surveys are not being undertaken as existing monitoring sites operated by Defra and/or local authorities are considered to give sufficient coverage[8].

2.4 Summary of NO_2 monitoring methodology

2.4.1 A survey of NO_2 concentrations using diffusion tubes commenced at the end of June 2016 for locations within Greater London. The survey was planned, installed and is operated in accordance with Defra Local Air Quality Management Technical Guidance 2016 (LAQM.TG(16))[9].

2.4.2 The sites selected for inclusion in the survey comprise of:

- Locations where the ES predicted significant effects;
- Co-located locations at pre-existing long term continuous monitoring sites, operated to European Union reference method standards for bias adjustment; and
- Background and roadside sites where significant effects were not predicted to provide control locations not expected to be affected by the Proposed Scheme.

2.4.3 Diffusion tubes are a passive monitoring method, that has the benefit of not requiring mains power and can be deployed over a large number of locations. In accordance with Defra LAQM.TG(16) guidance, diffusion tubes are exposed for a 4 or 5 week period depending on the length of the month. The diffusion tubes are then collected and returned to the laboratory for analysis at the end of each month and new diffusion tubes are deployed for the next month.

2.4.4 In accordance with Defra LAQM.TG(16) guidance, NO_2 diffusion tube surveys aim for a minimum data capture of 75% for each site for each year of the survey (i.e. there needs to

[8] HS2 are undertaking surveys of indicative PM_{10} for the purposes of management of construction dust.
[9] Department for Environment, Food and Rural Affairs, 2018, Local Air Quality Management Technical guidance. Available at: https://laqm.defra.gov.uk/technical-guidance/

be 9 out of 12 months with valid data at each site). This gives some allowance for the diffusion tube at a site to go missing or be damaged for a given month.

2.4.5 Where data capture over the year is less than 75%, a process of annualisation can be applied in accordance with Defra LAQM.TG(16) guidance to calculate an annual mean equivalent for a site. This process is based on the comparison of the months with available data against a full dataset for a long term fixed continuous monitoring site operated by Defra or local authorities.

2.4.6 A process of bias adjustment is also undertaken each year. Triplicate sets of diffusion tubes are co-located at long term fixed continuous monitoring sites operated by Defra or local authorities. The average concentration from the triplicate diffusion tubes is compared to the concentrations measured at the long term fixed continuous monitoring site and a correction factor is applied to all sites in the survey to bring these into line with the long term fixed continuous monitoring site.

2.4.7 Details of the diffusion tube locations included in the HS2 air quality monitoring survey are given in the table in Appendix B and maps in Appendix G.

2.4.8 The diffusion tubes used for the survey period between January and December 2018 were supplied by Gradko Environmental. The diffusion tube preparation used was 20% triethanolamine (TEA) in de-ionised water[10].

Calculation of the annual mean NO_2 Concentrations

2.4.9 Data collected with the diffusion tubes for the January to December 2018 period were annualised and bias adjusted in accordance with Defra LAQM.TG(16) guidance.

2.4.10 Continuous monitoring data, used to annualise and bias adjust diffusion tube data, were downloaded from www.londonair.org.uk and www.airqualityengland.co.uk.

2.4.11 Diffusion tube data for January to December 2018 were annualised in line with Defra LAQM.TG(16) guidance. The background [11] continuous monitoring sites Camden – Bloomsbury and Kensington and Chelsea – North Kensington were used to derive an annualisation factor for the data set.

2.4.12 Bias adjustment factors for background, roadside and kerbside[11] locations were derived using Defra's local bias adjustment factors spreadsheet[12]. Bias adjustment factors were derived using the data from diffusion tubes co-located with automatic monitoring sites.

[10] The Gradko 20% TEA in water diffusion tubes have a grey cap.

[11] Site location type are defined in Defra LAQM.TG(16):
- Kerbside sites are within one metre of the kerb of a busy road.
- Roadside sites are typically within one to five metres of the kerb of a busy road (although distance can be up to 15 m from the kerb in some cases).
- Background sites in urban areas are distanced from sources and therefore broadly representative of city-wide background conditions, such as urban residential areas.

[12] Department of Environment, Food and Rural Affairs, 2011, local bias adjustment factors spreadsheet version 04. Available at: https://laqm.defra.gov.uk/bias-adjustment-factors/local-bias.html

The background sites used were Camden – Bloomsbury and Kensington and Chelsea – North Kensington. The roadside sites used were, Camden – Euston Road, Ealing – Hanger Lane, Ealing – Western Avenue, and Hillingdon – South Ruislip. The kerbside sites used were Camden – Swiss Cottage and Westminster – Marylebone Road. Further details on the continuous monitoring sites are available at www.londonair.org.uk and at www.airqualityengland.co.uk. The precision of the tubes (the difference between the triplicate tubes at each location) was represented by calculating the coefficient of variation. It is considered that if the average coefficient of variation is below 10%, the survey is of good precision. All sites were found to have good precision and therefore all sites were used for bias adjustment.

2.4.13 Full details of the annualisation and bias adjustment factors calculated are presented in Appendix C.

2.5 HS2 NO_2 survey monitoring results

2.5.1 Full monitoring results for the air quality NO_2 diffusion tube survey are presented in the tables in Appendix D and maps in Appendix G.

2.6 Particulate matter monitoring results

2.6.1 HS2 has not undertaken supplementary surveys for particulate matter around highways, as existing monitoring sites operated by Defra and/or local authorities are considered to give sufficient coverage for the areas over which significant effects were identified. Monitoring data from relevant Defra and local authority monitoring sites are presented in the London Air Quality Network Summary Report 2017 [13], available at www.londonair.org.uk. The relevant monitoring sites are Camden – Bloomsbury, Camden – Euston Road, Camden – Swiss Cottage, Ealing – Hanger Lane, Ealing – Western Avenue, Kensington and Chelsea – North Kensington, Westminster – Marylebone Road and Hillingdon – South Ruislip (data for this site can be viewed and downloaded from www.airqualityengland.co.uk).

2.6.2 Dust is measured at appropriate locations at the construction site boundary and/or at sensitive receptors using instruments that provide continuous measurement of particulate matter as PM_{10}. As a minimum standard of measurement uncertainty, these instruments are certified through MCERTS as being indicative ambient particulate monitors. Monitoring is only undertaken at High or Medium dust risk sites, as determined through the Institute of Air Quality Monitoring (IAQM) Guidance on the assessment of dust from demolition and construction.

2.6.3 Where monitoring is undertaken, monthly summary reports are produced and published at https://www.gov.uk/government/collections/monitoring-the-environmental-effects-of-hs2 providing commentary on visual inspections and relevant trigger levels, and summary statistics for each monitoring site including max, min, mean, number of

[13] Kings College London, 2018, London Air Quality Network Summary Report 2017, November 2018.

exceedances of the trigger level and line charts of monthly data relevant to the trigger level. The trigger level is set in accordance with the IAQM Guidance on monitoring in the vicinity of demolition and construction sites.

3 Comparison to predictions in the environmental statement

3.1.1 Appendix E presents a comparison between the calculated 2018 results, the modelled prediction for peak NO_2 annual mean concentrations from the ES for the scenario without and with the Proposed Scheme in place[14]. Appendix F presents a comparison between the 2016, 2017 and 2018 monitored results.

3.1.2 This is an indicative comparison rather than an absolute one. There may be differences in the characteristics of the individual diffusion tube locations and the nearest receptor location assessed in the ES. For instance, receptor locations assessed in the ES were typically at the facades of properties adjacent to roads affected by the Proposed Scheme. However, due to the need to be able to access the sites to mount the diffusion tubes on a monthly basis, the diffusion tubes have typically been located on publicly accessible street furniture such as lampposts and signposts. The diffusion tube locations are intended to be representative of exposure locations along roads where significant effects were predicted during construction. In some instances, they are closer to roads than the locations where the public would typically be exposed.

3.1.3 Where comparisons of monitoring data and modelling prediction results are undertaken, Defra LAQM.TG(16) guidance suggests that if the difference is less than ±25% then the comparison can be considered acceptable.

3.1.4 The 2017 'without scheme' comparison indicates that:

- Of the 117 locations where monitoring was undertaken in 2018, monitored concentrations from 58 tubes were within ±25% of the modelled concentrations.
- Where the comparison has a difference of more than ±25%:
    - Monitored concentrations were higher than the modelled concentrations for 3 sites (3% of the overall sites), which occurred at locations adjacent to relatively high traffic roads for the area, specifically Hendon Way / Finchley Road, Camden High Street and Old Oak Common Lane respectively;
    - Modelled concentrations were higher than the monitored concentrations for 35 sites (30% of the overall sites), which were typically associated with locations on side streets away from major roads (however with one exception along Grays Inn Road, three along Euston Road and three along the A40); and
    - A further 21 tubes are not located in proximity to modelled receptors and thus have not undergone a comparison.

3.1.5 The 'with scheme' comparison of data from the closest representative modelled scenario from the main ES indicates that:

[14] Modelled annual mean NO_2 results are from the SES2 and AP3 Environmental Statement for locations east of the Edgware Road and from the SES and AP2 Environmental Statement for all other sites (predictions without Proposed Scheme concentrations are identical for the SES and AP2 and the SES3 and AP4 Environmental Statements).

- Of the 117 locations where monitoring was undertaken in 2018, monitored concentrations from 60 tubes were within ±25% of the modelled concentrations.
- Where comparison has a difference of more than ±25%:
    - Monitored concentrations were higher than the modelled concentrations for 3 sites (3% of the overall sites), which occurred at locations adjacent to relatively high traffic roads for the area, specifically Hendon Way / Finchley Road, Camden High Street and Old Oak Common Lane respectively;
    - Modelled concentrations were higher than the monitored concentrations for 33 sites (28% of the overall sites), which were typically associated with locations on side streets away from major roads (however with one exception along Grays Inn Road, three along Euston Road and three along the A40); and
    - A further 21 tubes are not located in proximity to modelled receptors and thus have not undergone a comparison.

3.1.6 The key reasons for differences in 2018 monitored annual mean NO_2 concentrations and the modelled annual mean NO_2 concentrations are as follows:

- For the ES modelling there was a more limited number of air quality monitoring sites available for model verification at the time the air quality modelling for the ES was undertaken;
- These sites were typically adjacent to high traffic roads recording concentrations well in excess of air quality standards;
- Monitoring sites representative of areas away from high traffic roads were limited so model performance in these areas could not be determined;
- This resulted in over adjustment of the air quality model for the locations away from high traffic roads and therefore higher predicted concentrations;
- For areas adjacent to high traffic flow roads and subject to congestion, the air quality modelling undertaken for the ES, was not able to fully reflect the impacts of congestion[15]; and
- Policy changes and public awareness around Air Quality issues and concerns (i.e. in preparation for the London Low Emission Zone ahead of the implementation in April 2019).

3.1.7 The ES determined significance of the air quality impacts based on the change in concentration relative to the modelled without Proposed Scheme concentrations. This approach and the relevant parameters to apply are set out in the Institute of Air Quality Management guidance, Planning for Air Quality (2017).

3.1.8 For the locations away from major roads where the modelled concentrations are higher than those monitored, then the modelling required a smaller change in concentrations

[15] Where there is congestion the real-world speeds of traffic are typically lower that those that are used in the air quality model. A very detailed level of modelling is required to reflect congestion in an air quality model, which was not possible for the ES due to the large geographic area over which the air quality assessment was undertaken.

due to the Proposed Scheme to give a significant effect. On this basis the modelling for the ES gave a worst-case view of the significant effects due to the Proposed Scheme.

3.1.9 For locations adjacent to high traffic flow roads, where the monitored concentrations were higher than the modelled concentrations, the modelled concentrations were higher than air quality standards so the changes in concentrations required for a significant effect is already small. On this basis the modelling or the ES did not underestimate the significant effects due to the Proposed Scheme for these locations.

3.1.10 Of the 117 diffusion tube monitoring locations in 2018, 11 locations were not monitored prior to 2018. Of the remaining 106 diffusion tubes, 69 locations indicated a reduction or no change in monitored concentrations between 2017 and 2018, with 37 indicating a slight increase in monitored concentrations. The number of locations at which the monitored concentrations exceeded the Air Quality Objective decreased between 2017 and 2018. However, an additional 6 locations are now reporting an exceedance with the Air Quality Objective. Eight (8) new locations note compliance with the Air Quality Objective when compared to the 2017 monitoring results.

4 Actions to improve air quality

4.1 Proposed actions

4.1.1 In developing an air quality action plan for the Proposed Scheme HS2 have already made commitments to measures to reduce emissions generated by construction activities. These measures are set out in the HS2 Phase 1 Code of Construction Practice (CoCP) and HS2 Phase One Information Paper E31: Air Quality.

4.1.2 The measures include:

- Construction vehicle emission standards requirements[16] and methods to manage their use via traffic management plans;
- NRMM emission standard requirements; and
- Dust mitigation measures as set out in the CoCP.

4.2 Progress and impact of measures to address air quality

4.2.1 The Proposed Scheme is currently in the early stages of the construction period. The year 2016 is considered a baseline period. The year 2017 also provides further baseline data due to the limited number of construction activities occurring during the year. The year 2018 is representative of the enabling works and therefore considered as an early construction year.

4.2.2 Phase One Information Paper E31: Air Quality sets out the HS2 emission standards. For construction vehicle emissions, NRMM and dust management. The construction vehicle standards came into effect on 14 September 2017 with the commencement of early works, including ground investigation surveys, land preparation works, ecological surveys, etc.

Vehicle and NRMM Compliance

4.2.3 Areas are divided into HS2 Phase One Area North, Central and South, where:

- Area North begins south of Long Itchington Wood tunnel (south of Warwick) and proceeds to the Birmingham Interchange and Curzon Street Stations, to Handsacre where it connects with the West Coast Main Line at Lichfield.
- Area Central extends from the Colne valley viaduct and Chiltern Tunnels, through to the North Portal Chiltern tunnels to Brackley, to the Itchington Green Tunnel, south portal area.
- Area South covers the Central Activity Zone (CAZ) (including Euston) and the Greater London Area.

4.2.4 The Phase One Area targets and requirements are presented in Table 2. Opportunities for exemptions are made available to all contractors on the grounds of specialism, triviality or

[16] The HS2 emission standards are set out HS2 Phase 1 Information Paper E31: Air Quality

unforeseen circumstances. HS2 have committed to granting no more than 8% unique vehicle exemptions, across the Phase One route, on an annual basis.

Table 2 – Construction Vehicle Emission Targets

Vehicle Class & Minimum Vehicle Emission Standard	**Area South**	**Rest of Route (Area Central and Area North)**
Heavy Goods Vehicles (HGVs) - Euro VI	Target – 100% from start of works	Target – 100% from start of works
	Requirement – 100% from start of works	Requirement – as far as reasonably practicable, 100% from 2020
Light Duty Vehicles (LDVs) - Euro 6 Diesel - Euro 4 Petrol	Target – 100% from start of works	Target – 80% from start of works
	Requirement – 100% from 2020	Requirement – 100% from 2020
Exemptions	No more than 8% of unique vehicles on an annual basis	

4.2.5 Similar to HGV and LDVs, NRMM (of a net power between 37kW and 560kW) are categorised based on their emissions. HS2 committed to stricter requirements than the London Supplementary Planning Guidance (SPG) which includes requirements for NRMM used within Greater London and the Central Activity Zone to be of a certain standard, dependant on the year of use. The NRMM emission targets that HS2 has committed to are presented in Table 3.

Table 3 – NRMM Emission Targets

Area	**London SPG Stage Requirements**		**HS2 Requirements**	
	From 2015	From 2020	From 2017	From 2020
Central Activity Zone (includes Euston)	IIIB	IV	$IV_{(1,2)}$	Best practice (Stage V)
Rest of Greater London	IIIA	IIIB	$IIIB_{(2)}$	$IV_{(1,2)}$
Rest of Country	Not Applicable	Not Applicable	$IIIB_{(2)}$	$IV_{(1,2)}$

Notes:

The above emission standard requirements should be read in conjunction with High Speed Two Information Paper, E31: Air Quality

(1) IIIB for $37 \leqslant P < 56$kW, as there is no corresponding Stage (IV) at EU Level

(2) IIIA for constant speed engines of any power, as there is no corresponding Stage IIIB or IV at EU level.

4.2.6 The 2018 compliance figures for vehicle emissions and NRMM are presented in Table 4.

Table 4 – 2018 Compliance Figures (Vehicle Emissions & NRMM)

Area	Category	Target / Requirement	Compliance Achieved
Area North	LDV	80% (Target)	66%
	HGV	100% (Target)	77%
	NRMM	100% (Requirement)	99%
Area Central	LDV	80% (Target)	74%
	HGV	100% (Target)	79%
	NRMM	100% (Requirement)	98%
Area South	LDV	100% (Target)	68%
	HGV HGV Exemptions Approved	100% (Requirement) <8% (Requirement)	98% 1%
	NRMM	100% (Requirement)	Greater London – 98%
			CAZ – 99%

Innovations

4.2.7 In October 2018, Ove Arup & Partners and HS2 were recognised for the innovative contributions to Air Quality at the National Air Quality Awards, where were the winners in the "*Commercial Sector Air Quality Initiative of the Year" category. The award was given for the "Air Quality Mitigation during Construction, Setting a New Standard*".

4.2.8 HS2 and Kings College London undertook a study to evaluate construction site monitoring strategies. The findings of this innovative work led to an update of existing Institute of Air Quality Management (IAQM) guidance document "*Guidance on Monitoring in the Vicinity of Demolition and Construction Sites*". This document and others produced by the IAQM are widely recognised as best practice both nationally and internationally. The changes to the guidance resulting from the HS2 / Kings College study were that:

- The dust trigger level was updated from 250µg/m^3 per 15-minute average, to 190µg/m^3 per 1-hour average;
- Baseline dust monitoring is no longer an absolute requirement (depending on the area); and
- Additional, more robust Quality Assurance measures.

4.2.9 This example of innovation is particularly significant because it will impact the wider Air Quality construction industry, not just HS2.

4.2.10 HS2 has also demonstrated innovation through the use of construction equipment with either zero (0) or significantly lower NO_x emissions. Some aspects of construction have been undertaken using electric equipment and hybrid excavators, reducing pollutant emissions from this site.

4.2.11 HS2 will continue to monitor air quality in line with the LAQM requirements as set out in the CoCP. In consideration of potential future local authority designated Clean Air Zones, HS2 has also been liaising with relevant local authorities and will consider these in future annual air quality reports. Furthermore, HS2 has published an Air Quality Action Plan to outline all commitments made with regards to air quality, and progress thereof in the management of the significant effects identified in the ES.

Appendix A – Summary of receptors with significant effects predicted in the ES

The number of receptors with significant effects is presented in Table 3 modelled in the ES. This has been calculated from the annual mean NO_2 modelling results presented in the ES, as amended. These calculations are a combination of results from the Supplementary Environmental Statement (SES) and Additional Provision (AP) 2, SES2 and AP3, SES3 and AP4. Air quality modelling was not undertaken for the SES4 and AP5 ES. The calculations use the latest reported modelling result for each receptor.

Table 5 – Summary of number of receptors modelled in the ES with adverse and beneficial significant effects for Greater London area

Significant effect	**Air quality impact descriptor**	**Number of receptors**
Significant adverse	Substantial adverse	227
Significant adverse	Moderate adverse	199
Not significant	Slight adverse	10
Not significant	Negligible	241
Not significant	Slight beneficial	10
Significant beneficial	Moderate beneficial	39
Significant beneficial	Substantial beneficial	31
Total number of receptors		**757**

Appendix B – HS2 air quality monitoring survey locations

Table 6 gives details of the locations included in the HS2 NO_2 diffusion tube survey during 2018. Appendix G presents maps of the locations, labelled with the site ID, colour coded based on the measured concentration.

Table 6 – Details of HS2 air quality NO_2 diffusion tube monitoring survey locations

Site ID	Local authority	Site location	Site location type	X coordinate	Y coordinate	Height (metres)	Site purpose

Notes:

Table contains raw data as presented in laboratory reports. Mean concentrations have not been annualised or bias adjusted and are not directly comparable to the NO_2 annual mean air quality standard of 40µg/m^3.

Appendix E – Comparison of 2018 annual mean NO_2 diffusion tube results and the predicted NO_2 annual mean concentrations from the ES

Table 10 presents a comparison of the 2018 annual mean NO_2 diffusion tube results and the predicted 2012 and 2017 NO_2 annual mean concentrations from the ES for the scenario without and peak annual mean NO_2 with the Proposed Scheme in place.

Table 10 – Comparison of the 2018 annual mean NO_2 diffusion tube results and the predicted NO_2 annual mean concentrations from the ES
