Year: 2019

Week: 43

Key messages

Data to: 27 October 2019

During week 43, NHS 111 cough calls continued to increase, particularly in children aged under 15 years (figures 4 & 4a). Vomiting and diarrhoea calls also increased during week 43 (figures 7 & 8)

Syndromic indicators at a glance:

Indicator	Trend	Level
Cold/flu	no trend	Below baseline threshold*
Fever	increasing	below baseline levels
Cough	increasing	above baseline levels
Difficulty breathing	increasing	above baseline levels
Sore throat	no trend	above baseline levels
Diarrhoea	increasing	below baseline levels
Vomiting	increasing	below baseline levels
Eye problems	increasing	above baseline levels

* Moving Epidemic Method (MEM) influenza activity threshold (see notes)

Data summary:

Year	Week	Total calls
2019	43	247,073

鯋 Public Health England

29 October 2019

1: Total calls.

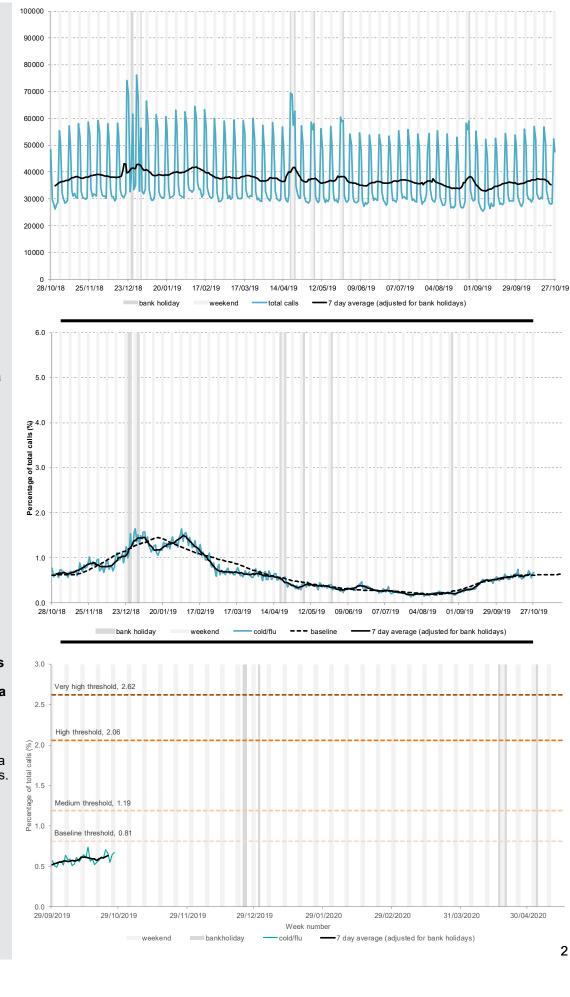

The total number of syndromic calls recorded each day by NHS 111.

Daily 'cold/flu' calls as a percentage of total calls. Baselines are constructed from historical data since 2013.

2b: Daily cold/flu calls (winter 2019/20) with MEM influenza activity thresholds (see notes)

Daily 'cold/flu' calls as a percentage of total calls. Baselines are constructed from historical data since 2013.

Week: 43

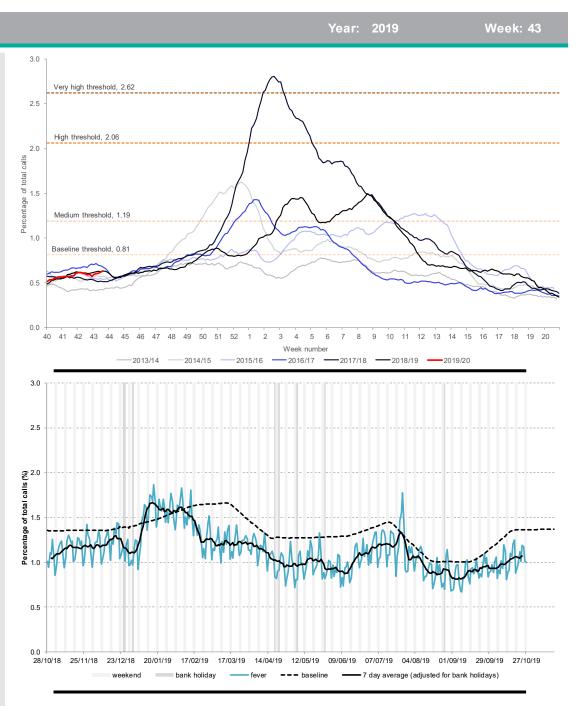

29 October 2019

2c: Daily cold/flu calls by week with MEM influenza activity thresholds and comparison to previous seasons (see notes)

Average daily calls as percentage of total calls by week (7 day moving average, All England, All ages).

3: Fever

Daily 'fever' calls as a percentage of total calls. Baselines are constructed from historical data since 2013.

4: Cough

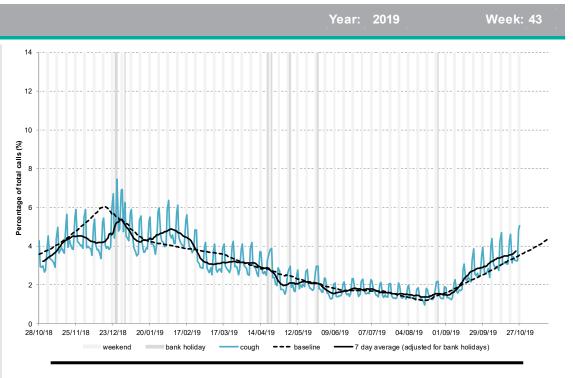

Daily 'cough' calls as a percentage of total calls. Baselines are constructed from historical data since 2013.

4a: Cough calls by age group

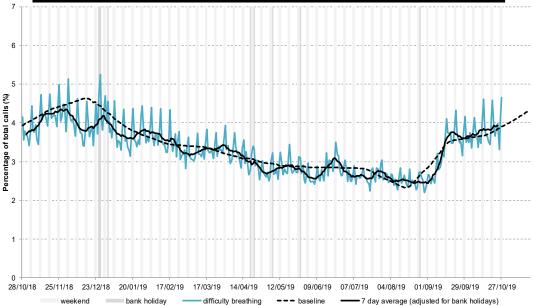

Cough calls as a percentage of total calls within each age group, shown as a 7 day moving average adjusted for bank holidays.

5: Difficulty breathing

Daily 'difficulty breathing' calls as a percentage of total calls. Baselines are constructed from historical data since 2013.

5a: Difficulty breathing calls by age group

Difficulty breathing calls as a percentage of total calls within each age group, shown as a 7 day moving average adjusted for bank holidays.

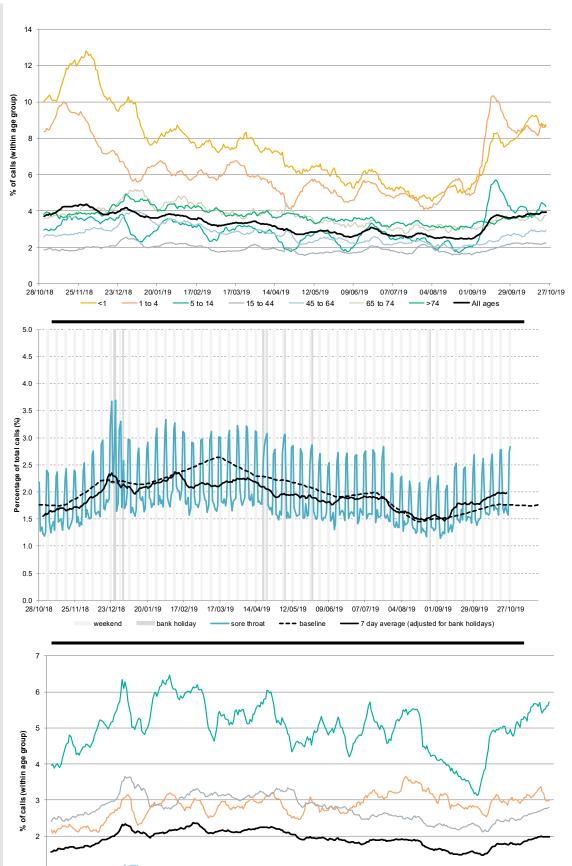

6: Sore throat

Daily 'sore throat' calls as a percentage of total calls. Baselines are constructed from historical data since 2013.

6a: Sore throat calls by age group

Sore throat calls as a percentage of total calls within each age group, shown as a 7 day moving average adjusted for bank holidays.

Remote Health Advice

29 October 2019	Year: 2019 Week: 43
Introduction to charts:	 Weekends and bank holidays are marked by vertical grey lines (bank holidays darker grey). A 7-day moving average (adjusted for bank holidays) is overlaid on the daily data reported in each chart, unless specified. Baselines represent seasonally expected levels of activity and are constructed from historical data since September 2013. They take into account any known substantial changes in data collection, population coverage or reporting practices. Baselines are refreshed using the latest data on a regular basis. NHS 111 call data are analysed on a daily basis to identify national and regional trends. A statistical algorithm underpins each system, routinely identifying activity that has increased significantly or is statistically significantly high for the time of year. Results from these daily analyses are assessed by the ReSST, along with analysis by age group, and anything deemed of public health importance is alerted by the team.
Moving Epidemic Method (MEM):	 During each winter we present Moving Epidemic Method (MEM) influenza thresholds on selected indicators. The moving epidemic method or MEM is a standard methodology used for setting influenza thresholds across many European nations.¹ MEM is used for NHS 111 cold/flu thresholds at a national level. MEM thresholds should be interpreted using 7 day moving averages rather than daily data. MEM thresholds currently use six years of historic data (2013-2019). The thresholds are re-calculated every year. Baseline ('pre-epidemic') thresholds are used alongside other surveillance systems to identify the start of influenza circulating in the community. 40%, 95% and 97.5% intensity thresholds are used to identify when influenza activity moves from low to medium, high or very high. ¹Vega T et al. Influenza Other Respir Viruses. 2013;7(4):546-58.
Notes and further information:	 Further information about NHS 111 can be found at: https://www.nhs.uk/using-the-nhs/nhs-services/urgent-and-emergency-care/ nhs-111/ The Remote Health Advice Syndromic Surveillance bulletin can also be downloaded from the PHE Real-time Syndromic Surveillance website which also contains more information about syndromic surveillance: https://www.gov.uk/government/collections/syndromic-surveillance-systems- and-analyses
Acknowledgements:	We are grateful to NHS 111 and to NHS Digital for their assistance and support in providing the anonymised call data that underpin the Remote Health Advice Syndromic Surveillance System.
