### GP Out-of-Hours Surveillance System: England

#### 29 October 2019

#### Year: 2019 Week: 43

### In This Issue:

Key Messages. Weekly summary. Total contacts. Syndromic indicators. Notes and caveats. Further information. Acknowledgements.

### Syndromic indicators at a glance:

Number of contacts and percentage of Read coded contacts.

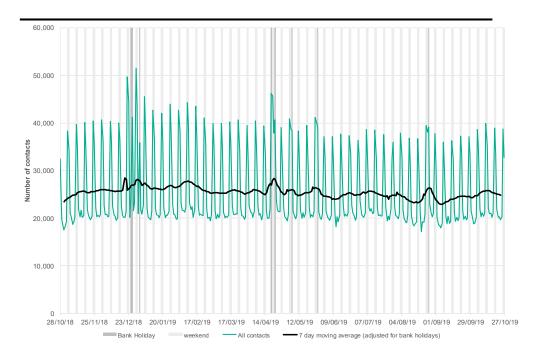

### Key messages

Data to: 27 October 2019

GP out-of-hours contacts for bronchitis/ bronchiolitis continued to increase during week 43, in line with seasonally expected trends (figure 2).

|                                    |                 | %       | %       |          |
|------------------------------------|-----------------|---------|---------|----------|
| Key indicator                      | No. of contacts | Week 43 | Week 42 | Trend*   |
| All OOH contacts, all causes       | 173,826         |         |         |          |
| Acute respiratory infection        | 9,522           | 14.09   | 14.07   | <b>^</b> |
| Influenza-like illness             | 130             | 0.19    | 0.16    | ←→       |
| Bronchitis/bronchiolitis           | 183             | 0.27    | 0.25    | 1        |
| Difficulty breathing/wheeze/asthma | 1,450           | 2.15    | 2.11    | ←→       |
| Pharyngitis                        | 65              | 0.10    | 0.10    | ←→       |
| Gastroenteritis                    | 2,348           | 3.48    | 3.55    | ←→       |
| Diarrhoea                          | 577             | 0.85    | 0.93    | ←→       |
| Vomiting                           | 930             | 1.38    | 1.36    | ←→       |
| Myocardial infarction              | 641             | 0.95    | 1.00    | ←→       |

\*Trend: reports on the trend seen over previous weeks in the percentage of Read coded contacts.

### 1: Total out-of-hours contacts:

Daily total number of out-of-hours and unscheduled contacts and 7 day average (adjusted for bank holidays).

#### 2: Acute Respiratory Infection daily contacts.

| Notes and caveats:                       | <ul> <li>This bulletin presents data from the Public Health England (PHE) GP Out<br/>-of-hours\Unscheduled Care Surveillance System (GP OOHSS).</li> <li>Fully anonymised data from GP out-of-hours (OOH) and unscheduled<br/>care service providers in England are being transferred to the PHE for<br/>analysis and interpretation by the PHE Real-time Syndromic Surveillance<br/>Team (ReSST).</li> <li>This system supplements existing PHE syndromic surveillance systems<br/>by monitoring data on general practitioner consultations outside of routine<br/>surgery opening times (evenings, weekends and bank holidays) and<br/>unplanned contacts within NHS primary care.</li> <li>The key indicators presented within this bulletin are derived by grouping<br/>selected Read coded consultations.</li> <li>GP OOH consultation data are analysed on a daily basis to identify<br/>national and regional trends. A statistical algorithm underpins each<br/>system, routinely identifying activity that has increased significantly or is<br/>statistically significantly high for the time of year. Results from these daily<br/>analyses are assessed by the ReSST, along with analysis by age group,<br/>and anything deemed of public health importance is alerted by the team.</li> <li>Baselines represent seasonally expected levels of activity and are<br/>constructed from historical data since Nov 2009. They take into account<br/>any known substantial changes in data collection, population coverage or<br/>reporting practices. Gastroenteritis, diarrhoea and vomiting baselines also<br/>account for changes since the introduction of rotavirus vaccine in July<br/>2013. Baselines are refreshed using the latest data on a regular basis.</li> </ul> |  |
| Moving Epidemic<br>Method (MEM):         | <ul> <li>During winter we present Moving Epidemic Method (MEM) influenza thresholds on selected indicators.</li> <li>The moving epidemic method or MEM is a standard methodology used for setting influenza thresholds across many European nations.<sup>1</sup></li> <li>MEM is used for GP OOH ILI thresholds at a national level.</li> <li>MEM thresholds should be interpreted using 7 day moving averages rather than daily data.</li> <li>MEM thresholds currently use six years of historic data (2013-2019). The thresholds are re-calculated every year.</li> <li>Baseline ('Pre-epidemic') thresholds are used alongside other surveillance systems to identify the start of influenza circulating in the community</li> <li>40%, 95% and 97.5% intensity thresholds are used to identify when influenza activity moves from low to medium, high or very high. <sup>1</sup>Vega T et al. Influenza Other Respir Viruses. 2013;7(4):546-58.</li> </ul>   |  |
| Further information:                     | The GP Out-of-Hours Surveillance System Bulletin can also be<br>downloaded from the PHE Real-time Syndromic Surveillance website which<br>also contains more information about syndromic surveillance:  |  |
