Appendices

Appendix A: SA Database

Appendix B: Assessment of the South East Marine Plan Preferred Policies

1. Introduction and Purpose of this Report

1.1 Introduction

The South East Marine Plan has been subject to an integrated Sustainability Appraisal (SA) and Strategic Environmental Assessment (SEA) (hereafter referred to as SA) in line with the requirements of Statutory Instrument 2004 No. 1633: The Environmental Assessment of Plans and Programmes Regulations 2004.

This report is Part 3 of the SA Report. It presents the results of the assessment of the South East Marine Plan and its reasonable alternatives.

The SA has been carried out by ClearLead Consulting Ltd, in association with WSP UK Ltd and MarineSpace Ltd. on behalf of the MMO.

1.2 Structure of this Report

The SEA Regulations require that an assessment is carried out on a draft version of the South East Marine Plan and a statutory environmental report (an SA report under the English planning system) is produced and consulted on. This report sets out the SA process followed, outlines why alternatives were selected or rejected, reports on the assessment of the draft marine plan and outlines a programme for monitoring the effects of the marine plan. This SA Report has been produced alongside the production of the South East Marine Plan and is published for consultation at the same time, providing respondents with appropriate information to base their representations about the sustainability implications of the marine plan.

For the sake of clarity, this SA Report is split into a number of parts. This is Part 3 of the SA Report: Results of the Assessment. The other parts of the report are:

- Part 1: Introduction and Methodology
- Part 2: Scoping Information

A separate Non-Technical Summary is also available.

All reports are available at the following weblink:

<https://www.gov.uk/topic/planning-development/mariSE-planning>

This report addresses the following:

- the reasons for selecting the alternatives dealt with
- the results of the assessment, including the effects of the plan objectives, alternative options and effects of the draft versions of the South East Marine Plan, and mitigation measures for each of the assessment topics, which are:
 - Cultural Heritage
 - Geology, Substrates and Coastal Processes
 - Seascape and Landscape
 - Water
 - Air Quality
 - Climate

- Communities, Health and Wellbeing
 - Economy
 - Biodiversity Habitats Flora and Fauna
- Cumulative effects assessment
- Monitoring programme.

Sections 4 to 12 of this report present the potential significant effects of the South East Marine Plan by SA topic.

Full detailed assessments are available in a separate technical appendix (SA Report Appendix B: Assessment of the South East Marine Plan Preferred Policies). The technical appendix can be filtered in order to view particular parts of the assessment, SA topics or sub-topics or particular policy groupings. For example, in order to view the assessment of one policy grouping, column E can be filtered by clicking the 'button' in row 1 and selecting a grouping from the list that appears. Similarly, to view the assessment against an SA sub-topic, click the 'button' in row 1, column C and select the SA sub-topic from the list that appears.

The assessment of policies has been informed by the MMO's interactive marine planning tool, the Marine Information System (MIS). The MIS is to be superseded by an alternate service, Explore Marine Plans, which will also be accessible online. The MIS draws data from various sources including the MMO, delivery partners and industry, and compiles information on sectors and activities which support the development and implementation of marine plans.

2. The Reasons for Selecting Alternatives

2.1 Introduction

As part of the development of the South East Marine Plan, several reasonable alternative options for the policies within the South East Marine Plan were identified by the MMO and tested through the SA. As required by the [SEA Regulations](#) (Schedule 2), the SA Report identifies the reasons for the selection of the preferred options in preference to other alternative options.

In SA, this is interpreted as having two meanings:

1. why it was 'reasonable' to select the alternatives which were developed to be tested
2. why the preferred approach was selected in light of the SA of alternatives.

2.2 The Alternatives Developed

Prior to options development the MMO identified key issues, which were then categorised as opportunities or challenges across the south east inshore marine plan area, which were determined at an appropriate spatial and temporal scale. These key issues were then recorded within the Issues and Evidence Database and arranged into themes:

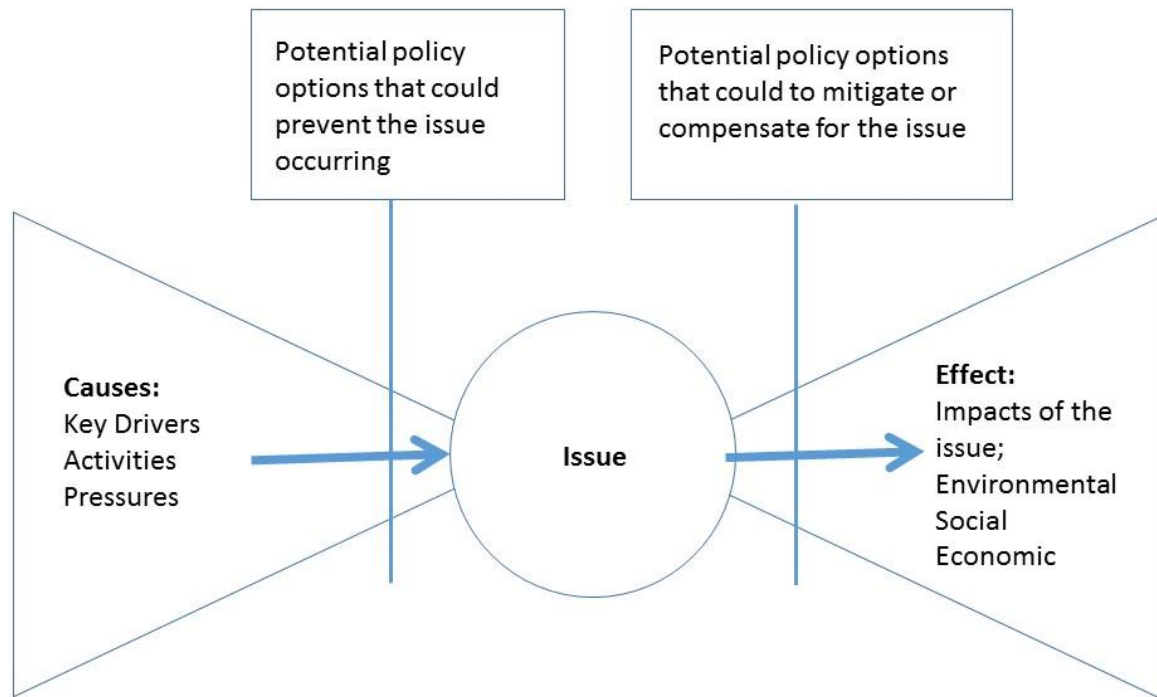

- **economy:** aquaculture, co-existence, ports and harbours, shipping, renewables, oil and gas, cables, infrastructure, aggregates
- **environment:** climate change, coastal change, air quality, disturbance, ecosystem approach, habitats, invasive non-native species, litter, Marine Protected Areas, geodiversity, species, water quality
- **governance:** cumulative effects
- **social:** access, employment, fisheries, historic environment, seascape, tourism and recreation, dredging and disposal, heritage assets, defence.

The issues under these themes are not exclusive and others have been included as appropriate when issues and supporting evidence have been identified through the planning process.

Once key issues were identified for the south east inshore marine plan area, the causes and effects of these issues were considered, and later validated by stakeholders. Using this, the MMO identified where the most appropriate policy intervention could sit, either preventing the cause of the issue, or where this can't be controlled by policies within the South East Marine Plan, addressing the effect of the issue.

This process is presented in Figure 1 below.

Figure 1: Methodology for Devising Policy Options.

From this, realistic and deliverable alternatives were created, which align with the Marine Policy Statement (MPS) High Level Marine Objectives (HLMOs)¹ and other relevant legislation, as well as address current and future issues in plan areas. As a result, each of the marine plan areas has a variety of different 'groupings' (for example, Access) and each 'grouping' had a number of potential options. The groupings and options reflect key issues in each of the marine plan areas, and therefore vary across plan areas. For the South East Inshore Marine Plan there were 28 groupings under which 264 individual options were assessed through the SA.

These options were subject to stakeholder engagement during Iteration 2 across the seven current marine plan areas. This took place between 29 January and 29 March 2018. Across these seven marine plan areas, a total of 1632 comments were received by the MMO in response to the Iteration 2 consultation. This stakeholder input, along with the SA's options assessment findings, was then used to identify a preferred and sustainable option for each grouping which could be developed into a detailed policy.

Following the identification of a preferred option for each grouping, compatibility checks were undertaken by the MMO, during which the preferred option for each grouping was compared with other preferred options to ensure compatibility with each other. Following this exercise, a gap analysis was undertaken which identified any policy gaps within each marine plan area. A policy gap is where policies existed in other plan areas that were deemed to be nationally relevant, so were therefore introduced in areas where they did not exist after the iteration 2 options process.

¹ HM Government, UK Marine Policy Statement, 2011

During the compatibility check and gap analysis exercises, some policy options were merged to create preferred policies compatible across the four marine plan areas and some additional preferred policies were introduced to some marine plans in order to fill an identified policy gap. In these cases, the policies had not been considered at the options (Iteration 2) stage as no marine plan issues had been identified in the earlier marine plan development stages. In these cases, there is not considered to be an alternative option to consider because the policy is required to fill a policy gap.

Through the development of the preferred set of policies for each marine plan area, options have been rejected for the following reasons:

- they were not identified as the most sustainable option in the SA
- they were not identified as compatible with other preferred policies, for example because they were a duplicate or overlapped with another policy (in which case some preferred policies were merged, or their strength changed)
- they were not favoured by stakeholders during the Iteration 2 engagement in February / March 2018.

Iteration 3 stakeholder engagement was then undertaken on a preferred set of policies with detailed policy content between 21 January 2019 and 29 March 2019. Following engagement, the preferred policies were edited to address consultee comments. The final set of preferred policies was then passed to the SA consultants for assessment. The methodology followed for undertaking this assessment is described in Section 3.3 Part 1 of the Sustainability Appraisal Report.

2.3 Reasons for Selecting the Alternatives

As mentioned above, stakeholder input, along with the SA's options assessment findings were used to identify a preferred and sustainable option for each grouping which was then developed into a detailed policy. Some of the preferred policies result from a combination of options assessed at the assessment stage and some have also been merged with other policy options.

2.4 Findings of the Assessment of Alternatives

The options assessment stage was undertaken between June 2017 and April 2018 by ClearLead Consulting Ltd working in association with WSP Ltd and MarineSpace Ltd.

The options stage was a significant phase in the marine planning process; it considered the different ways of delivering the vision and HLMO objectives and was the mechanism which determined how the marine plan responded to issues in the south east inshore marine plan area. The options assessment formed part of Iteration 2 of the SA of the marine plans, and the methodology for this is set out within Part 1 of the SA Report.

All reasonable policy options for the south east inshore marine plan area were assessed against each SA sub-topic. The SA Database was referred to throughout the assessments to provide evidence of relevant issues and baseline data. The

assessment focussed on identifying potential significant effects and providing a comparison between the options being considered for each policy grouping.

The key recommendations from the assessment of the options were to avoid taking forward options which were identified as having the potential to result in a significant negative effect on the SA sub-topic, and to opt for options which would enhance the significant positive effects identified. It was also recommended that policy authors minimise the uncertainty associated with the implementation of a policy. Where applicable, the assessors also identified further mitigation measures which could assist with the development of the preferred options.

The assessment outputs from the options assessment stage comprised of an Excel workbook containing the assessments of the policy options for each grouping against the relevant SA sub-topics. This totaled 254 policy options across 29 groupings. From the completed assessments, a pivot table and chart were generated, providing a visual representation of the findings of the assessment for each grouping. An example is shown below. This allowed a quick comparison to be made of the relative performance of all options within a grouping (A – N of the x axis within the example provided below) against the relevant SA sub-topics (tallied in the y axis within the example provided below).

The options assessment of the draft South East Marine Plan was reported in an options assessment SA report which was published in June 2018. The report can be found [here](#), and is organised in 4 sections:

- Section 1 sets out the purpose of this report and details of the options being assessed for the marine plans
- Section 2 outlines the methodology of the SA options assessment
- Section 3 summarises the results of the SA options assessment
- Section 4 outlines the next steps in the plan making and SA processes.

Within Section 3 of the report, the results of the SA options assessment are summarized by policy grouping, highlighting the potential significant or uncertain effects which may be had on any of the SA topics as a result of the implementation of any of the policy options within the individual policy grouping. It presents the comparison of the performance of options assessed for each grouping in the form of a pivot chart. The findings of the assessment of options has been used by the MMO to make decisions between options to be taken forward, with the aim being to take forward the most sustainable option (as identified within the assessment). The decision making has also considered the responses from stakeholders to the Iteration 2 engagement undertaken by the MMO. Figure 2 below shows an example of the options assessment output.

Figure 2: Example Options Assessment Output.

DRAFT

3 Summary of Preferred Policies Assessment Results

3.1 Introduction

This section presents a summary of the assessment findings of the South East Marine Plan. This section indicates the headline results, identifying the potential significant positive and negative effects of the SA topics and sub-topics against the policy groupings. The effects presented within the headline results take into account mitigation provided from other plan policies, but does not include possible mitigation from other existing plans and policies. The assessment results are described further for each SA topic in the subsequent sections to this report and presented in detail in Appendix B to this report.

The headline results of the assessment are summarised in Table 1 below.

4 Results of the Assessment - Cultural Heritage

4.1 Introduction

This section of the report presents the performance of the South East Marine Plan in relation to cultural heritage. It covers heritage assets within the south east inshore marine plan area and those which are adjacent to the south east inshore marine plan area. Due to the similarities in performance across the cultural heritage SA sub-topics, the description of results have been grouped. The full assessment of the cultural heritage SA topic can be found in Appendix B.

4.2 Results of the Assessment of all Policy Groupings on Cultural Heritage

Figure 3: Effects on the Heritage Assets within the Marine Plan Area SA Sub-Topic.

Figure 4: Effects on the Heritage Assets Adjacent to the Marine Plan Area SA Sub-Topic.

A potential significant positive effect has been identified for the heritage assets within the marine plan area SA sub-topic in relation to the cultural heritage policy grouping. The significance of heritage assets in the immediate vicinity of the south east inshore marine plan area, is susceptible to the effects arising from activities within marine plan area. This policy grouping aims to protect heritage assets from developments that have the potential to result in adverse effects.

Potential significant negative effects have been identified for the heritage assets both within and adjacent to the south east inshore marine plan area SA sub-topics in relation to the cables policy grouping. Buried subsea cables have the potential to disturb both known and undiscovered archaeological sites. A preference for burying cables is included within the policy wording, which may have the potential to exacerbate disturbance on heritage assets, hence the significant negative effects identified.

The baseline has identified the potential for adverse effects on heritage assets with regards to aggregates extraction. Although the policy may not result in further extraction sites within the south east inshore marine plan area, the policies will safeguard existing aggregate sites. For this reason, a significant negative effect has been identified.

In the south east inshore marine plan area, there are ten major ports and five minor ports, which require maintenance dredging to maintain access². The baseline has identified the significant under exploited potential of buried heritage assets in the

² Futures Analysis for the North East, North West, South East and South West Marine Plan Areas (June 2017)

inshore marine plan area, as well as the potential for adverse effects on those heritage assets that are already uncovered, from dredging and disposal. The baseline has identified the significant under exploited potential of buried heritage assets in the marine plan area, as well as the potential for adverse effects on those heritage assets that are already uncovered, from dredging and disposal. Policies SE-DD-1 and SE-DD-2 aim to safeguard existing dredging activity within the marine plan area, rather than increasing dredging activity. However, as dredging is an enabling activity which is essential to the functioning of ports and marinas, it is assumed that policies SE-PS-1 and SE-PS-2 will also help dredging activity to continue. As dredging activity at present is negatively affecting cultural heritage, it is assumed that at best, the current baseline situation will continue, and for this reason a significant negative effect has been identified.

An uncertain effect has also been identified in relation to the ports and harbours (including shipping) policy grouping. Future ports, harbours and shipping activity have the potential to effect heritage assets, particularly those that may be buried and not yet uncovered. Associated port activities, such as dredging, could also be increased as a result. However, an uncertain effect has been identified as the policy and supporting text do not stipulate whether potential activity will be undertaken or where it would be located. It is however understood that this will be identified in harbour master plans to be developed as part of Maritime 2050³, which could allow for greater certainty, with regards to the effects on heritage assets.

Oil, gas and CCUS developments have potential to adversely affect buried heritage assets. One gas terminal (The Isle of Grain Liquid Natural Gas Terminal) is present within the south east inshore marine plan area. There are no oil fields or terminals and no currently licenced areas to be awarded or offered in the south east inshore marine plan area. It is therefore unlikely that policies SE-OG-1 and SE-OG-2 that offer safeguarding will result in future developments, however, this can't be known for certain. The effects of CCUS on heritage assets are not known, and again it is not clear if policy CCUS-2 would explicitly lead to future CCUS activity in the marine plan area.

An uncertain effect has been identified for the heritage assets within the marine plan area SA sub-topic in relation to the renewables policy grouping. It is recognised that all marine renewable energy types have the potential to adversely affect heritage assets with the marine environment through their connection with the seabed, be this through the connection of the device itself with the seabed, such as the foundation of a turbine or the anchoring of a wave device, or through contact between any heritage asset and the cable which connects to the shore. The extent of these effects is largely dependent on the device used, and on the installation methods opted for, for example, if the cable is submerged within a trench in the seabed, has rock armour applied, or is simply laid across the seabed surface.

³ Department for Transport, Maritime 2050, Navigating the Future, 2019

4.3 Suggested Mitigation Measures

Mitigation measures identified in the assessment to address potential uncertain or significant negative effects are identified within Table 2.

Table 2: Suggested Mitigation Measures for Uncertain and Significant Negative Effects on Cultural Heritage.

SA Sub-Topic	Causal Grouping	Mitigation measures identified in the assessment
<p>Heritage assets within south east inshore marine plan area</p> <p>Heritage assets adjacent to the south east inshore marine plan area (for Cables grouping only)</p>	<p>Cables, Aggregates, Dredging and disposal, Oil and gas, Ports and harbours (including shipping), and Renewables</p>	<p>There is an assumption that any proposals arising from these sectors will need to address the potential for adverse effects to arise on heritage assets through the Environmental Impact Assessment (EIA) process, where required under the Marine Works EIA Regulations 2017.</p> <p>Policy SE-HER-1 aims to provide protection to heritage assets, however, it is recommended that consideration is given to amending the policy supporting text to refer specifically to activities which may occur as a result of these groupings and related proposals.</p>
<p>Heritage assets within south east inshore marine plan area</p>	<p>Aggregates</p>	<p>The Crown Estate leasing process and other required consenting schemes also ensures that sensitive receptors are taken into account during these processes and conditions frequently applied to limit effects.</p>

5 Results of the Assessment - Geology, Substrates & Coastal Processes

5.1 Introduction

This section of the report presents the performance of the South East Marine Plan in relation to geology, substrates and coastal processes. It covers seabed substrates and bathymetry, and coastal features and processes, these are both separate SA sub-topics. Due to the similarities in performance across the two SA sub-topics, the description of results have been grouped. The full assessment of the geology, substrates and coastal processes SA topic can be found in Technical Appendix B.

5.2 Results of the Assessment of all Policy Groupings on Geology, Substrates and Coastal Processes

Figure 5: Effects on the Coastal Feature and Processes SA Sub-Topic.

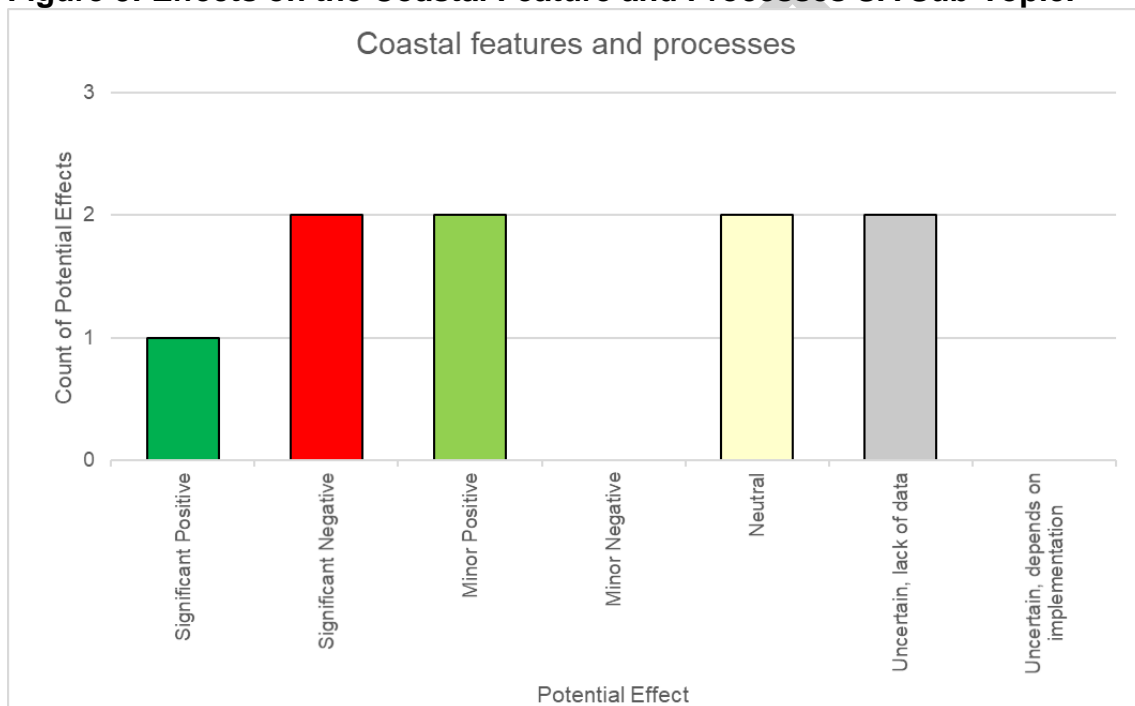

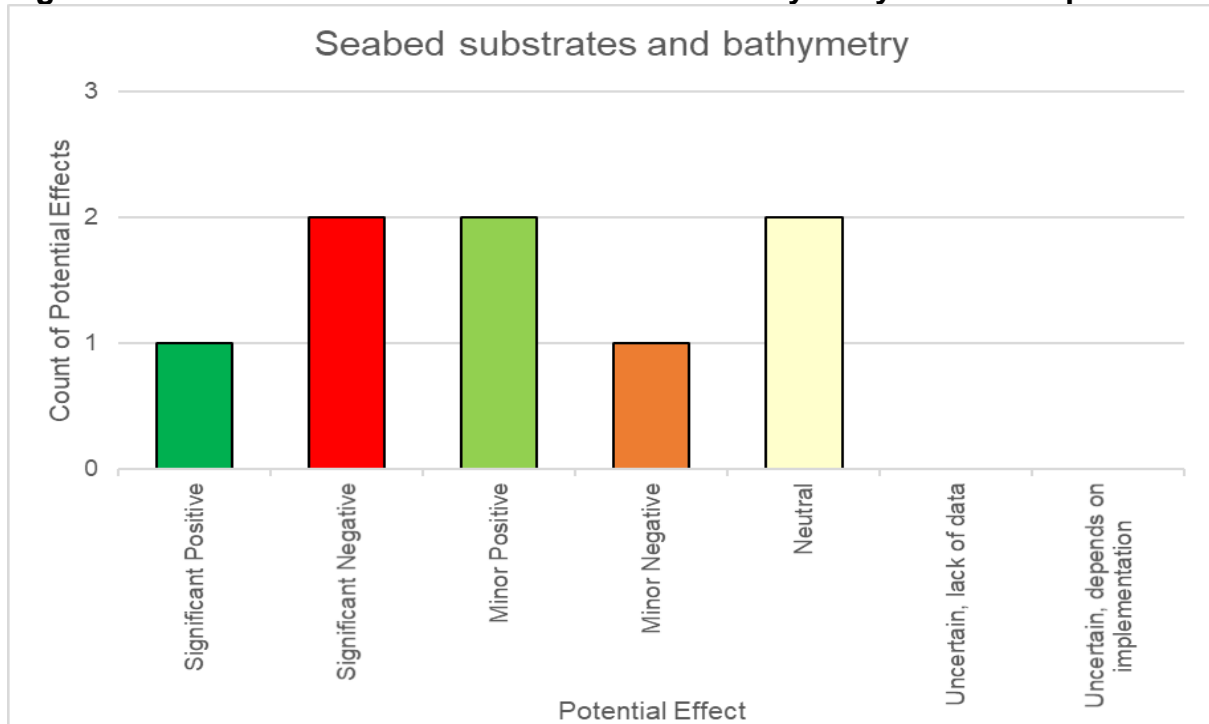

Figure 6: Effects on the Seabed Substrate and Bathymetry SA Sub-Topic.

A significant positive effect has been identified for coastal features and processes, in relation to the climate change policy grouping. Policies SE-CC-1, SE-CC-2, SE-CC-3, SE-CC-5 and SE-CC-6 in combination, seek to increase resilience of geology to the effects of climate change, minimise adverse effects on coastal change adaptation measures and support proposals which have the potential to increase flood defence and carbon sequestering habitats.

Supporting services underpin all of the other services and occur throughout the south east inshore marine plan area. The seabed provides a role for both nutrient cycling and carbon sinks, the importance of which has been identified within the supporting text to policy SE-NG-1. As a result of this policy, it is assumed that the seabed substrates and bathymetry SA sub-topic would be offered protection, due to the importance of these assets, and for this reason, a significant positive effect has been identified.

The south east marine plan area contains three Geological Conservation Review Sites, which are indicative of 26 different processes, formations and regimes, relating to sediment supply and transport, tides, waves, surges, currents and sea-level history. Marine dredging has potential to result in the loss of seabed substrates, whilst disposal of dredge materials can disturb the seabed at the selected disposal site. The dredging and disposal policy grouping aim to safeguard dredging activity within the marine plan area, rather than increasing dredging activity, however, as dredging is an enabling activity which is essential to the functioning of ports and marinas, it is assumed that policies SE-DD-1 and SE-DD-2 will help dredging activity to continue. As dredging activity at present is negatively affecting both coastal features and processes and seabed substrate and bathymetry, it is assumed that at best, the current baseline situation will continue, and for this reason a significant negative effect has been identified, for both SA sub-topics.

Aggregate extraction and dredging and disposal activities have the potential to affect areas of seabed altering sediment processes and physical processes and creating sediment plumes as well as alter the hydrodynamic regime and consequently coastal processes. Although the aggregate policies may not result in further extraction sites within the south east marine plan area, the policies will help to safeguard existing aggregate sites. The policy does not offer protection for seabed substrates and bathymetry, and protection is not provided by other policies within the Plan. For these reasons, a significant negative effect has been identified for the seabed substrates and bathymetry and coastal features and processes SA sub-topics.

Further uncertain effects have been identified in relation to the natural capital policy grouping, as it is unclear whether the coastal protection provided by geology and coastal features is considered a natural capital benefit and therefore considered to be a natural capital asset. Therefore, at present, the effects of policy SE-NG-1 on coastal features and processes, would be entirely dependent on its implementation.

Coastal squeeze is an issue within the marine plan area, which is often exacerbated through human activity and the presence of coastal defences. The issue is likely to be exacerbated further by climate change and sea level rise, and the need to protect the coastline. According to the baseline, the UK is locked into accelerated sea level rise, regardless of what we do about greenhouse gas emissions. Sea level rise has potential to give way to increased coastal erosion, inundation of the coastline and coastal squeeze.

Due to the current lack of evidence on future scenarios of coastal processes, an uncertain effect has been identified in relation to the air quality grouping and the coastal features and processes sub-topic.

The effects of renewable energy installations on potentially sensitive environmental features are unknown at present. Policies SE-REN-1, SE-REN-2 and SE-WIND-1 have the potential to result in the further renewable energy developments within the south east inshore marine plan area. Whilst the installation of renewable technology and subsequent reduced contributions to climate change may help to appease the effects of increased storminess such as coastal inundation and change, development within the marine environment, particularly onshore, may affect environmental features either directly or through alterations of coastal processes. Due to the unknown type and location of future renewable sites, an uncertain effect has been identified, for the coastal features and processes sub-topic.

5.3 Suggested Mitigation Measures

Mitigation measures identified in the assessment to address potential uncertain or significant negative effects are identified within Table 3.

Table 3: Suggested Mitigation Measures for Uncertain and Significant Negative Effects on Geology, Substrates and Coastal Processes.

SA Sub-Topic	Causal Grouping	Mitigation Measures Identified in the Assessment
Coastal features and processes Seabed substrates and bathymetry	Aggregates, Dredging and disposal	<p>Any proposals arising from these sectors will need to address the potential for adverse effects to arise on both coastal features and processes and seabed substrates and bathymetry, through the EIA process.</p> <p>Policy SE-MPA-4 could provide some protection, however, supporting text could be strengthened by making reference to Geological Conservation Review Sites.</p>
Coastal features and processes	Air quality	<p>Policies SE-CC-5 could provide some resilience, however, it is suggested that Policy SE-CC-5 supporting text should draw upon the latest climate change projections provided within the UKC18 Marine Report, as it currently refers to UKCPC09.</p> <p>The supporting text for SE-AIR-1 currently states that air pollution contributes to climate change, however, it does not detail the potential negative implications of climate change on coastal features and processes. It is suggested that the policy supporting text details the negative effects of climate change, of which air pollution can contribute to.</p>
Coastal features and processes	Renewables	<p>If future renewable energy proposals were to come forward, the potential negative effects on coastal features and processes will need to be addressed through the EIA process (for schedule 2 developments as classified by the EIA regulations, it is assumed that an EIA will be undertaken should the project be likely to give rise to significant environmental effects, be located in a sensitive area and is above the threshold specified in the EIA regulations).</p>
Coastal features and processes, Seabed substrates and bathymetry	Aggregates	<p>The Crown Estate's leasing process and other required consenting schemes also ensures that cultural heritage receptors are taken into account during these processes and conditions frequently applied to limit effects.</p>

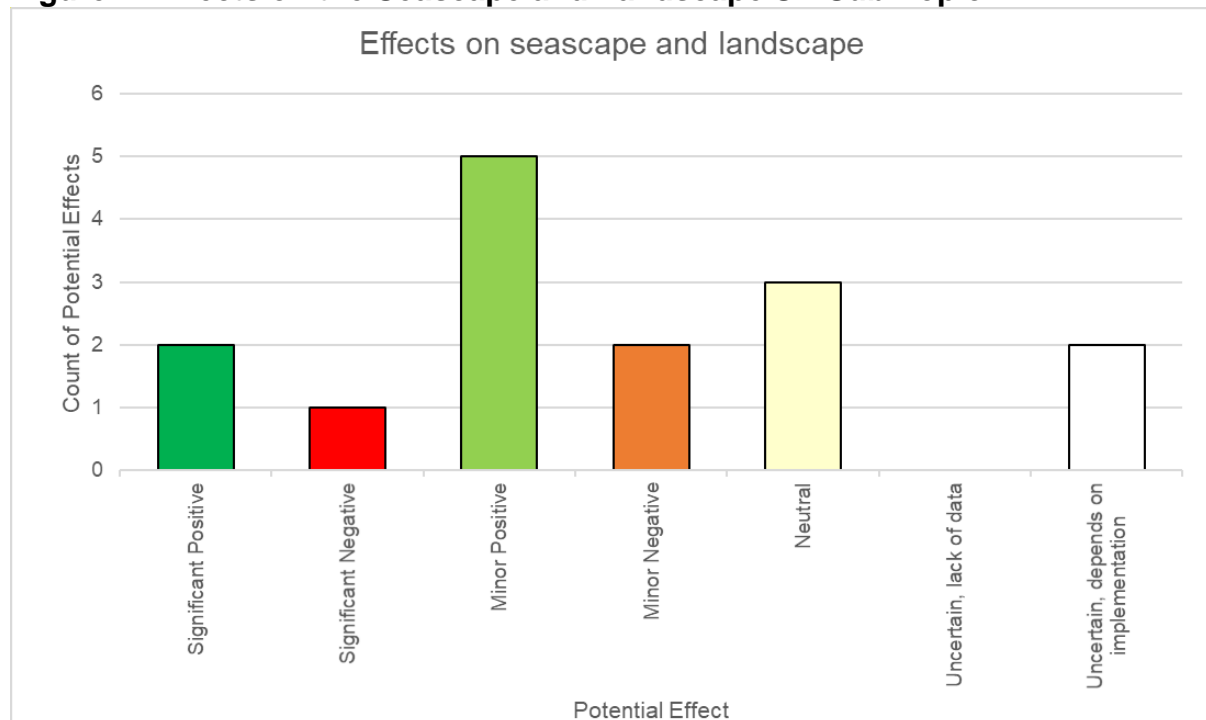

6 Results of the Assessment - Seascape & Landscape

6.1 Introduction

This section of the report presents the performance of the South East Marine Plan in relation to seascape and landscape. There are no SA sub-topics for seascape and landscape. The full assessment of the seascape and landscape SA topic can be found in Technical Appendix B.

6.2 Results of the Assessment of all Policy Groupings on Seascape & Landscape

Figure 7: Effects on the Seascape and Landscape SA Sub-Topic.

There is a close relationship between the presence of heritage assets and the character, value and appreciation of landscape and seascape. Policy SE-HER-1 aims to protect heritage assets from future proposals, ensuring that the diversity of the marine environment, and its cultural heritage, is protected. The policy supporting text has also identified how the setting of heritage assets may also be important to the significance of the asset. For these reasons, a significant positive effect has been identified, with regards to the heritage assets policy grouping.

Further significant positive effects have been identified in relation to the seascape and landscape policy grouping. Policy SE-SCP-1 aims to maintain and improve the seascape and landscape within the south east inshore marine plan area. Proposals which may harm the current seascape or landscape must demonstrate why this is necessary and mitigate adverse effects.

Both landscape and seascape can be highly sensitive to visual effects associated with developments. Given the importance of the Kent Downs AONB and the number

of designated special protection areas and special areas of conservation, located within the marine plan area, if future developments were to come forward, there is potential for adverse effects to occur. The south east inshore marine plan area has been identified as having potential for wave, tidal stream and tidal range energy resources. There are seven operational offshore wind farms in the area, with a combined capacity of 1254.3MW. It is assumed that policies will aid these future developments, which could negatively affect the seascape and landscape. For these reasons, significant negative effects have been identified.

Similar to renewables, oil and gas developments have potential to negatively affect the seascape and landscape character. At present, there are no oil or gas fields or terminals in the south east inshore marine plan area and no currently licenced areas to be awarded or offered in the south east marine plan area. It is therefore unlikely that policies SE-OG-1 and SE-OG-2 that offer safeguarding, will result in future developments, however, this can't be known for certain, therefore an uncertain effect has been identified.

The potential effect which may be had on seascapes and landscapes by policy SE-NG-1 is uncertain at present and dependent on its implementation. Seascapes and landscapes are vulnerable to adverse and cumulative effects from multiple sectors and activities. As a natural capital asset, seascapes and landscapes can provide benefits associated with tourism, recreation, wellbeing and cultural value. It is uncertain therefore whether the preservation of the quality of landscapes and seascapes as natural capital assets would take precedence over the activities which are dependent on the benefits and services which they provide.

6.3 Suggested Mitigation Measures

Mitigation measures identified in the assessment to address potential uncertain or significant negative effects are identified within Table 4.

Table 4: Suggested Mitigation Measures for Uncertain and Significant Negative Effects on Landscape and Seascape.

SA Sub-Topic	Causal Grouping	Mitigation measures identified in the assessment
Landscape and seascape	Cables, Aggregates, Infrastructure, Oil and gas and Renewables	Any proposals arising from these sectors will need to address the potential for adverse effects to arise on both landscape and seascape, through the EIA process.
Landscape and seascape	Renewables Aggregates	The Crown Estate leasing process and other required consenting schemes also ensures that sensitive receptors are taken into account during these processes and conditions frequently applied to limit effects.

7 Results of the Assessment - Water

7.1 Introduction

This section of the report presents the performance of the South East Marine Plan in relation to water. It covers tides and currents, water temperature and salinity, pollution and water quality (including eutrophication) and marine litter, which comprise four separate SA sub-topics. The full assessment of the water SA topic can be found in Technical Appendix B.

7.2 Results of the Assessment of all Policy Groupings on Water

7.2.1 Marine Litter

Figure 8: Effects on the Marine Litter SA Sub-Topic.

Marine litter is cross-boundary in nature as litter moves in the marine environment and litter originating from one marine plan area or even country can affect another. The European Commission has stated in order to tackle marine litter issues, a joined up approach is needed. The SE-CBC-1 policy supporting text states that the alignment of marine planning with other planning, regulation and management bodies is necessary in order to manage pressures and aims to ensure cross-boundary effects are minimised across international borders. It is therefore considered that the cross-boundary policy has the potential to result in a significant positive effect on marine litter.

Significant negative effects have been identified in relation to the fisheries policy grouping and the marine litter SA sub-topic. Marine litter is a prevalent issue across the south east inshore marine plan area, of which the fishing industry is a key contributor.

Ports and shipping can contribute to marine litter. As policies SE-PS-1 and SE-PS-4 could result in increased shipping activity, there is potential for increases for in marine litter and thus a potential significant negative effect has been identified.

Bathing water quality is important for the local economy, particularly tourism and recreation. Increased levels of tourism have potential to increase levels of marine litter within the south east inshore marine plan area. Policy SE-TR-1 states that 'sustainable tourism and recreational activities' will be supported, however, it is not clear whether the policy will support improving marine litter. For this reason, an uncertain effect has been identified in relation to the tourism and recreation policy grouping and the marine litter SA sub-topic.

7.2.2 Pollution and Water Quality

Figure 9: Effects on the Pollution and Water Quality SA Sub-Topic.

Policy SE-WQ-1 aims to enhance and restore water quality within the south east inshore marine plan area. Given that water quality is an issue across the marine plan area, it is assumed that this policy will result in the improvement of water quality, therefore a significant positive effect has been identified in relation to pollution and water quality SA sub-topic and the water quality policy grouping.

The natural capital policy grouping has potential to result in a significant positive effect. It has been assumed that SE-NG-1 should discourage proposals which may have a significant adverse effect on the marine environment and any natural capital

which can be derived from this, and would thereby encourage improved water quality and pollution status of waters both within the south east inshore marine plan area and beyond.

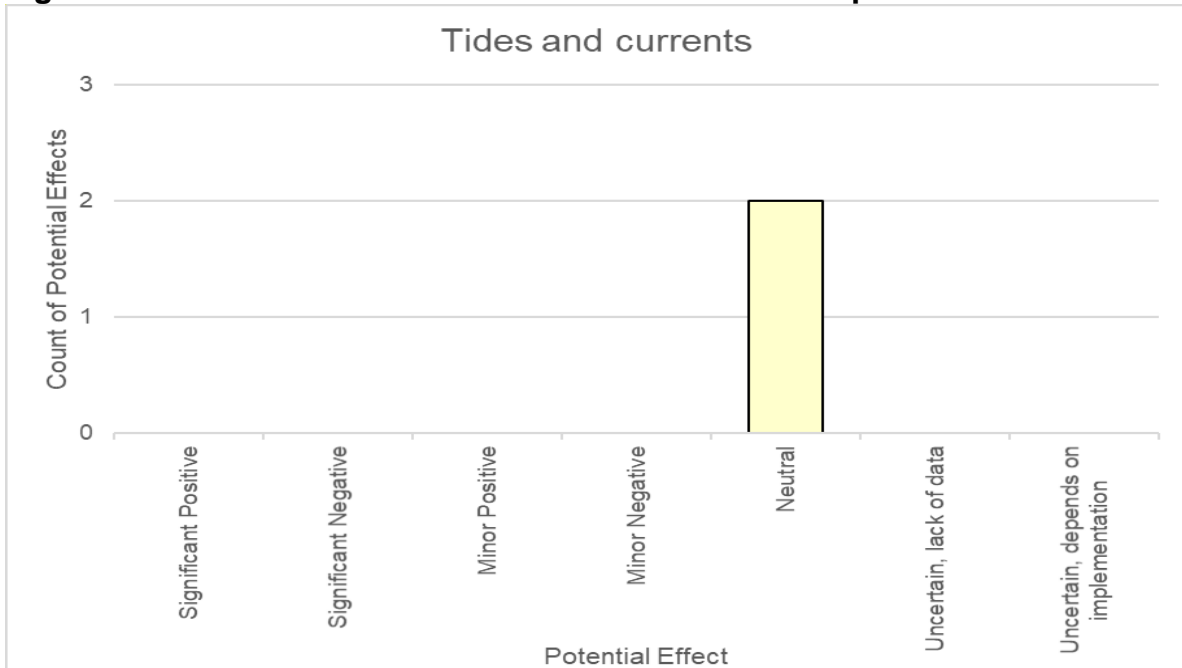

Shipping can negatively affect water quality through the possible discharges from ships such as bilge water, ballast water, sewage and other residues in a ship. Spills of oils, lubricants, fuels and other oily liquids can also be sources of water pollution from both ports and ships. Policies SE-PS-1 and SE-PS-4 could result in increased shipping activity and policies which have potential to cause a reduction in water quality, acidification and salinity changes and potential for pollution from contaminants used. There is potential for both the ports and harbour policy groupings to have a significant negative effect on water quality.

There are no oil or gas fields or terminals in the south east inshore marine plan area and no currently licenced areas to be awarded or offered in the south east marine plan area. It is therefore unlikely that policies SE-OG-1 and SE-OG-2 that offer safeguarding will result in future developments, however, this can't be known for certain. Policy SE-CCUS-1 encourages the use of CCUS which have the potential to cause a reduction in water quality, acidification/salinity changes and potential for pollution from contaminants used. However, it is not clear if policy CCUS-2 would explicitly lead to future CCUS activity in the south east inshore marine plan area.

Bathing water quality is important for the local economy, particularly tourism and recreation. Increased levels of tourism have potential to negatively affect water quality within the south east inshore plan area. Policy SE-TR-1 states that 'sustainable tourism and recreational activities' will be supported, however, it is not clear whether 'sustainable tourism' will result in a positive effect on water quality. For this reason, an uncertain effect has been identified in relation to the tourism and recreation policy grouping and the pollution and water quality SA sub-topic.

7.2.3 Tides and Currents

Figure 10: Effects on the Tides and Currents SA Sub-Topic.

No significant or uncertain effects have been identified for the tides and currents SA sub-topic.

7.2.4 Water Temperature and Salinity

Figure 11: Effects on the Water Temperature and Salinity SA Sub-Topic.

A potential significant indirect positive effect has been identified in relation to the renewables policy grouping on the water temperature and salinity SA sub-topic. It is

assumed that an increase in renewable energy generation as those supported through policies SE-REN-1, SE-REN-2 and SE-WIND-1, could work to counter the advance of climate change and the associated effects on water temperature and salinity.

7.3 Suggested Mitigation Measures

Mitigation measures identified in the assessment to address potential uncertain or significant negative effects are identified within Table 5.

Table 5: Suggested Mitigation Measures for Uncertain and Significant Negative Effects on Water.

SA Sub-Topic	Causal Grouping	Mitigation measures identified in the assessment
Marine Litter, Water Quality	Aquaculture and fisheries	<p>Whilst it is recognised that marine litter can enter the marine plan area from adjacent areas, policy SE-ML-2 seeks to minimise the potential release of litter from aquaculture sites within the south east marine plan area.</p> <p>It is suggested that SE-ML-1 explicitly makes reference to the fisheries sector, or that a fisheries-specific policy is created which prevents the intentional release of gear into the marine environment and provides support for the retrieval of debris which has already become marine litter.</p>
Pollution and water quality	Oil and gas and ports and shipping	<p>If oil and gas development is undertaken, the potential negative effects on water quality will need to be addressed through the EIA process.</p> <p>As ports and shipping developments would be classified as schedule 2 developments by the EIA Regulations, it is assumed that an EIA will be undertaken, should the project be likely to give rise to significant environmental effects, be located in a sensitive area and if the proposal is above the threshold specified in the EIA regulations.</p>
Pollution and water quality and Marine Litter	Tourism and recreation	Supporting text for policy SE-TR-1 needs to clearly identify what is meant by 'sustainable tourism and recreational activities' and highlight the importance of water quality to tourism and recreation.

8 Results of the Assessment - Air Quality

8.1 Introduction

This section of the report presents the performance of the South East Marine Plan in relation to air quality. It covers the air pollutant sub-topic. The full assessment of the Air Quality SA topic can be found in Technical Appendix B.

8.2 Results of the Assessment of all Policy Groupings on Air Quality

Figure 12: Effects on the Air Pollutant SA Sub-Topic.

Policy SE-AIR-1 could effectively help to reduce air pollution for future proposals, The policy aims for all proposals to demonstrate consideration of their contribution to air pollution, both direct and cumulative. Given that air pollution is an issue in the south east marine plan area, the policy has the potential to effectively help to reduce air pollution therefore, a significant positive effect has been identified with regards to the air pollutants SA sub-topic and the air quality policy grouping. The policy is likely to be further supported by local planning policies as well as the Clean Air Strategy⁴.

Ports and shipping activity contribute significantly to air pollution. Policy SE-PS-1 could result in further port and shipping activity in the region, and subsequently negatively affect air quality. There is some uncertainty regarding 'sustainable expansion' and whether this will contribute to a reduction air pollution. Policy

⁴ Department for Environment Food and Rural Affairs, Clean Air Strategy, 2019

SE-PS-4, encourages short sea shipping, which has potential to benefit air quality particularly when compared with other forms of transport. This could result in significant positive effects on air pollutant levels, however, it is not clear on the preference of policies SE-PS-1 and SE-PS-4, as they could have differing overall effects on air pollution.

8.3 Suggested Mitigation Measures

Mitigation measures identified in the assessment to address potential uncertain or significant negative effects are identified within Table 6.

Table 6: Suggested Mitigation Measures for Uncertain and Significant Negative Effects on Air Quality.

SA Sub-Topic	Causal Grouping	Mitigation Measures Identified in the Assessment
Air pollutants	Ports and harbours	As ports and shipping developments would be classified as schedule 2 developments by the EIA Regulations, it is assumed that an EIA will be undertaken, should the project be likely to give rise to significant environmental effects, be located in a sensitive area and if the proposal is above the threshold specified in the EIA regulations.

9. Results of the Assessment - Climate

9.1 Introduction

This section of the report presents the performance of the South East Marine Plan in relation to climate. It covers greenhouse gas emissions and climate change resilience and adaptation. Due to the similarities in performance across the two climate SA sub-topics, the description of results has been grouped. The full assessment of the Climate SA topic can be found in Technical Appendix B Results of the Assessment of all Policy Groupings on Climate.

9.2 Results of the Assessment of all Policy Groupings on Climate

Figure 13: Effects on the Climate Change Resilience and Adaptation SA Sub-Topic.

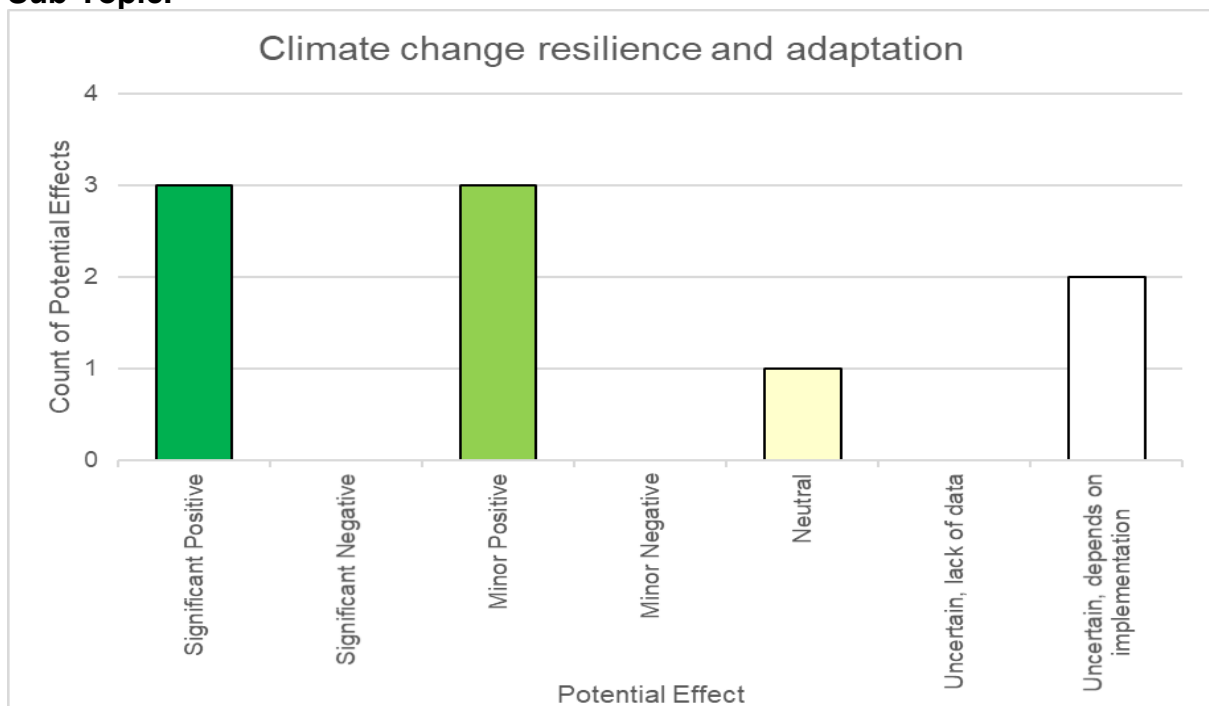

Figure 14: Effects on the Greenhouse Gas Emissions SA Sub-Topic.

The climate change policy grouping has resulted in a potential significant effect on climate change resilience and adaptation SA sub-topic. In combination, policies SE-CC-1, SE-CC-2, SE-CC-3, SE-CC-5 and SE-CC-6 seek to increase resilience and adaptation to the effects of climate change. This includes the minimisation of adverse effects on coastal change adaptation measures and support of proposals which have the potential to increase flood defence and carbon sequestering habitats.

Further potential significant positive effects have been identified, with regards to the marine protected areas policy grouping and the climate change resilience and adaptation SA sub-topic. The issue of climate change adaption is directly addressed, with clear preference for proposals which enhance the adaptability of Marine Protected Areas to climate change.

Policy SE-AIR-1 aims for all proposals to demonstrate consideration of their contribution to air quality and greenhouse gas emissions, both directly and cumulatively. Given that air pollution is an issue in the south east inshore marine plan area, the policy has the potential to effectively help to reduce air pollution. The policy is likely to be further supported by local planning policies as well as the Clean Air Strategy⁵. For this reason, a significant positive effect has been identified for the greenhouse gas emissions SA-sub-topic.

A potential significant positive effect has been identified in relation to the renewables policy grouping on the greenhouse gas emissions SA sub-topic as these policies support increased energy generation by marine renewables which in turn could alleviate demand on greenhouse gas-emitting fossil fuel energy generation. Natural flood defences provide regulatory natural capital services. In the south east marine plan area mudflats in the Medway Estuary play an important natural role in

⁵ Department for Environment Food and Rural Affairs, Clean Air Strategy, 2019

protecting the coast from flood events by reducing wave energy and buffering flood waters. It is therefore assumed that as a result of the natural capital policy, natural flood defences in the inshore plan area will be protected, which in turn will provide climate change resilience.

Port and shipping activity contribute significantly to greenhouse gas emissions. Policy SE-PS-1 could result in further port and shipping activity in the region, and increased levels of greenhouse gas emissions. There is some uncertainty regarding 'sustainable expansion' and whether this will contribute to a reduction in greenhouse gas emissions. Policy SE-PS-4, encourages short-sea shipping, which has potential to benefit air pollution particularly when compared with other forms of transport. This has the potential to result in significant positive effects on air pollutants, however, this would depend on how the policy is implemented; if short-sea shipping is used in conjunction with existing shipping, overall shipping could increase, and potentially worsen greenhouse gas emissions. For these reasons, uncertain effects have been identified in relation to the ports and harbours policy grouping and greenhouse gas emissions.

Carbon capture usage and storage (CCUS) has the potential to provide opportunities to reduce greenhouse gas emissions and is an important element of the UK's Carbon Plan. Carbon capture and storage could be beneficial in achieving the UK's carbon targets, including its proposed transition to a carbon neutral status. In isolation, Policy SE-CC-2 has the potential to result in a positive effect on greenhouse gas emissions. At present, there are no oil or gas fields or terminals in the south east inshore marine plan area and no currently licenced areas to be awarded or offered in the south east marine area. It is therefore unlikely that policies SE-OG-1 and SE-OG-2 that offer safeguarding, will result in future developments, however, this can't be known for certain, therefore an uncertain effect has been identified.

There is potential for future oil and gas developments to be offset by carbon capture usage and storage, but it is not clear whether any of these developments will come forward, within the south east inshore marine plan area.

9.3 Suggested Mitigation Measures

Mitigation measures identified in the assessment to address potential uncertain or significant negative effects are identified within Table 7.

Table 7: Suggested Mitigation Measures for Uncertain and Significant Negative Effects on Climate.

SA Sub-Topic	Causal Grouping	Mitigation Measures Identified in the Assessment
Climate change resilience and adaptation	Air quality	Policies SE-CC-5 could provide some resilience, however, it is suggested that Policy-CC-5 supporting text should draw upon the latest climate change projections provided within the UKC18 Marine Report, as it currently refers to UKCPC09.
Climate change resilience and adaptation and Greenhouse gas emissions	Ports and harbours	<p>As port and shipping developments would be classified as schedule 2 development by the EIA regulations, it is assumed that an EIA will be undertaken, should the project be likely to give rise to significant environmental effects, be located in a sensitive area and is above the threshold specified in the EIA regulations.</p> <p>Policy SE-AIR-1 could help to ensure that future ports and shipping proposals consider their effects upon air quality, which could mitigate potential negative effects.</p>
Climate change resilience and adaptation and Greenhouse gas emissions	Oil and gas	<p>As oil and gas developments are classed as Schedule 1 developments, under the EIA regulations, any oil and gas development that would come forward as a result of this policy, would be subjected to an EIA.</p> <p>The specific reference to greenhouse gas emissions in the EIA regulations seeks to address this issue with the intention of embedding climate change consideration.</p>

10. Results of the Assessment - Communities, Health & Wellbeing

10.1 Introduction

This section of the report presents the performance of the South East Marine Plan in relation to communities, health and wellbeing. This topic covers health and wider determinants of health and effects on communities, which comprise one SA sub-topic, and effects on protected equality groups, which comprise a second SA sub-topic. Further details of the assessment for the communities, health and wellbeing SA topic can be found within Technical Appendix B.

10.2 Results of the Assessment of all Policy Groupings on Communities, Health & Wellbeing

10.2.1 Effects on Communities

Figure 15: Effects on the Communities SA Sub-Topic.

The baseline has identified income and employment deprivation issues associated with coastal communities across the south east inshore marine plan area. As SE-EMP-1 is specifically aimed at areas of deprivation and focusses employment opportunities on local skill sets, a significant positive effect has been identified with regards to the employment policy grouping and the effects on communities SA sub-topic.

Further significant positive effects have been identified in relation to the tourism and recreation grouping. Increased access to tourism and recreation activities has the potential to provide significant social benefits for communities through, greater social

cohesion, improved health and wellbeing (both physical and mental) and job creation.

Deprivation in relation to income, employment and education shows some more deprived lower super output areas (LSOA) on the coast compared to the rest of England⁶. Policy supporting text states that proposals that occur in the south east inshore marine plan area should consider the cross-boundary effects upon adjacent marine plan area and the terrestrial environment including economic, social and environmental effects, in order to achieve sustainable development. It is therefore considered that all future proposals will need to consider their effect on communities in order to achieve sustainable development, and for this reason a potential significant positive effect has been identified in relation to SE-CBC-1.

Communities derive a significant number of benefits from natural capital and the ecosystem services it provides. As the natural capital policy aims to protect natural capital within the south east marine plan area, a significant positive effect has been identified. It is assumed that the 25 Year Environment Plan could also contribute to the achievement of policy SE-NG-1.

Policy SE-REN-1 aims to support associated renewable technology supply chains, which could result in increased employment opportunities. However, at this stage, it is not clear as to whether any proposals will come forward, and the likely available employment opportunities. For these reasons, an uncertain effect has been recorded with regards to the renewables policy grouping and effects on communities SA sub-topic.

⁶ The Indices of Deprivation 2015 measures deprivation in small areas across England. These small areas are called Lower-Layer Super Output Areas (LSOAs) and are a standard way of dividing up the country – Ministry of Housing, Communities and Local Government (formerly the Department for Communities and Local Government), The English Indices of Deprivation 2015

10.2.2 Effects of protected equality groups

Figure 16: Effects on the Protected Equality Groups SA Sub-Topic.

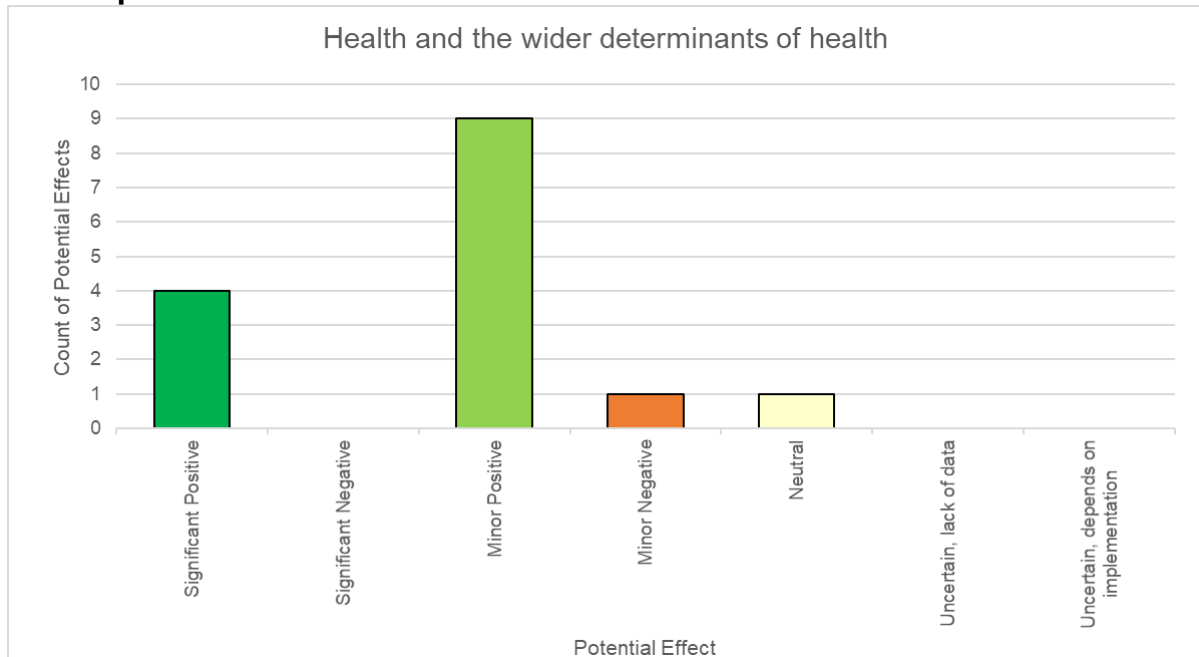

Under the Equalities Act (2010)⁷, protected characteristics are age, disability, sex, gender reassignment, pregnancy or maternity, race, religion or belief, sexual orientation, marriage and civil partnership. The employment policy supporting text states it will encourage public authorities to consider the long-term employment benefits of a proposal and how the required skills equate to those of the marine plan area. It will enable maximum sustainable activity, prosperity and opportunities for all, both now and in the future. It is therefore assumed that the employment policy will help to provide employment opportunities for all, including those from protected equality groups, and for this reason, a significant positive effect has been identified.

⁷ Equality Act 2010 (Commencement No. 1) Order 2010 (SI 2010/1736)

10.2.3 Health and the Wider Determinants of Health

Figure 17: Effects on the Health and Wider Determinants of Health SA Sub-Topic.

The baseline has identified that health problems are more prevalent on the coast, with some of the most deprived LSOAs in England being located on the coast⁸. The south east marine plan area has over 20 LSOAs within the top 10% of the most deprived areas in England, with regards to health deprivation and disability. Access to a high quality marine environment can make a significant contribution to the mental and physical health and wellbeing of communities. Given the issues identified in the baseline, the social benefit policy grouping has potential to tackle these and result in a significant positive effect.

The tourism and recreation policy aims to protect existing recreational and tourism developments from future proposals and support future recreation and tourism opportunities. As recreation plays such a vital role for health and wellbeing, a significant positive effect has been identified, for the tourism and recreation policy grouping.

Similarly, the protection that the natural capital policy provides to natural capital assets, is likely to see natural capital assets that provide benefits to health and wellbeing protected, and for this reason a significant positive effect has been identified. The 25 Year Environment Plan could contribute to the achievement of SE-NG-1.

The supporting text for the cross boundary considerations policy states that proposals that occur in the south east inshore marine plan area should consider the

⁸ The Indices of Deprivation 2015 measures deprivation in small areas across England. These small areas are called Lower-Layer Super Output Areas (LSOAs) and are a standard way of dividing up the country – Ministry of Housing, Communities and Local Government (formerly the Department for Communities and Local Government), The English Indices of Deprivation 2015

cross-boundary effects upon adjacent terrestrial environment including economic, social and environmental effects. As social, environmental and economic effects are taken into consideration, it is assumed that this policy has the potential to result in a significant positive effect on health, in particular the wider determinants of health.

10.3 Suggested Mitigation Measures

Mitigation measures identified in the assessment to address potential uncertain or significant negative effects are identified within Table 8.

Table 8: Suggested Mitigation Measures for Uncertain and Significant Negative Effects on Communities, Health & Wellbeing.

SA Sub-Topic	Causal Grouping	Mitigation measures identified in the assessment
Effects on communities	Renewables	<p>Policy supporting text for SE-REN-1 should be expanded to better detail potential employment opportunities associated with renewable energy supply chains. If future renewable energy proposals were to come forward, the potential negative effects on communities will need to be addressed through the EIA process.</p> <p>The Crown Estate leasing process and other required consenting schemes also ensures that sensitive receptors are taken into account during these processes and conditions frequently applied to limit effects.</p>

11. Results of the Assessment - Economy

11.1 Introduction

This section of the report presents the performance of the South East Marine Plan in relation to the economy. This topic encompasses ports and shipping, fisheries and aquaculture, leisure / recreation and tourism, marine manufacturing, defence, aggregate extraction, energy generation and infrastructure development (renewables, carbon capture usage and storage, nuclear and fossil fuels) and seabed assets. Each of these comprises a separate SA sub-topic, and all have been scoped in for SA of both the inshore and offshore south east inshore marine plan area.

Sub-section 11.2 is split into nine parts, reflecting the seven SA sub-topics. The full assessment of the economy SA topic can be found in Technical Appendix B.

11.2 Results of the Assessment of all Policy Groupings on Economy

11.2.1 Aggregate Extraction

Figure 18: Effects on the Aggregate Extraction SA Sub-Topic.

The aggregate policy grouping provides safeguarding to both existing and future aggregate sites within the south east inshore marine plan area. The baseline has identified the significance of the UK marine aggregates and the importance they could play in the future for meeting housing demands and provision of fill for major coastal infrastructure projects, such as ports, coastal defences, renewable energy and nuclear energy projects. For these reasons a potential significant positive effect

has been identified. Additional potential significant positive effects have also been identified in relation to the infrastructure policy grouping. Policy SE-INF-2 within the grouping aims to safeguard existing landing facilities within the south east marine plan area, which at present are predominantly used for aggregate activity.

The potential effect which may be had on aggregate extraction by the natural capital policy grouping is at present uncertain, and would be dependent on its implementation. Aggregate extraction is dependent on, and benefited by, the natural capital which provides marine aggregates. However, it may have a significant adverse effect on other elements of marine and coastal natural capital such as biodiversity, and as such, may be affected by policy SE-NG-1.

As marine aggregates contribute to provision of fill for major coastal infrastructure projects, including renewable energy projects, SE-REN-1 may have an indirect positive effect on the aggregates sector. However, SE-REN-2 may limit aggregate extraction in areas which are held under lease or an agreement for renewable energy generation installations. For these reasons, an uncertain effect has been identified as the effects of the renewables policy grouping on the aggregate SA sub-topic would be dependent on its implementation.

11.2.2 Defence

Figure 19: Effects on the Defence SA Sub-Topic.

Uncertainty has been recorded within the access policy grouping, as it is unclear how public access to areas used for defence will be treated. There may be some activities which are incompatible with public access, but it is unclear whether access for the public or defence activities would be given priority.

11.2.3 Energy generation and infrastructure development

Figure 20: Effects on the Energy Generation and Infrastructure SA Sub-Topic.

The baseline has identified the importance that oil and gas contributes to the UK's economy and electrical interconnections with other nations help to contribute to UK energy security, affordability and decarbonisation objectives. The renewable policy grouping supports the UK's Clean Growth Strategy, by offering potential to deliver clean, renewable energy. The cables, renewables and oil and gas policy groupings have the potential to help enable future development within the marine plan area, promote new technologies and help to ensure energy security for the future. For these reasons, potential significant positive effects on the energy generation and infrastructure development SA sub-topic, have been identified.

Uncertainty has been recorded in relation to the air quality policy grouping, as policy SE-AIR-1 could result in the limitation of future emissions from energy production sources, specifically oil and gas developments. There is also potential that the policy could result in a shift towards cleaner energy sources and create new opportunities within the energy sector. The types of proposals targeted by this policy are not clear, and for this reason an uncertain effect has been identified.

The employment policy grouping has potential to result in significant positive effects on energy generation and infrastructure development, as it could support further development, diversification and employment opportunities.

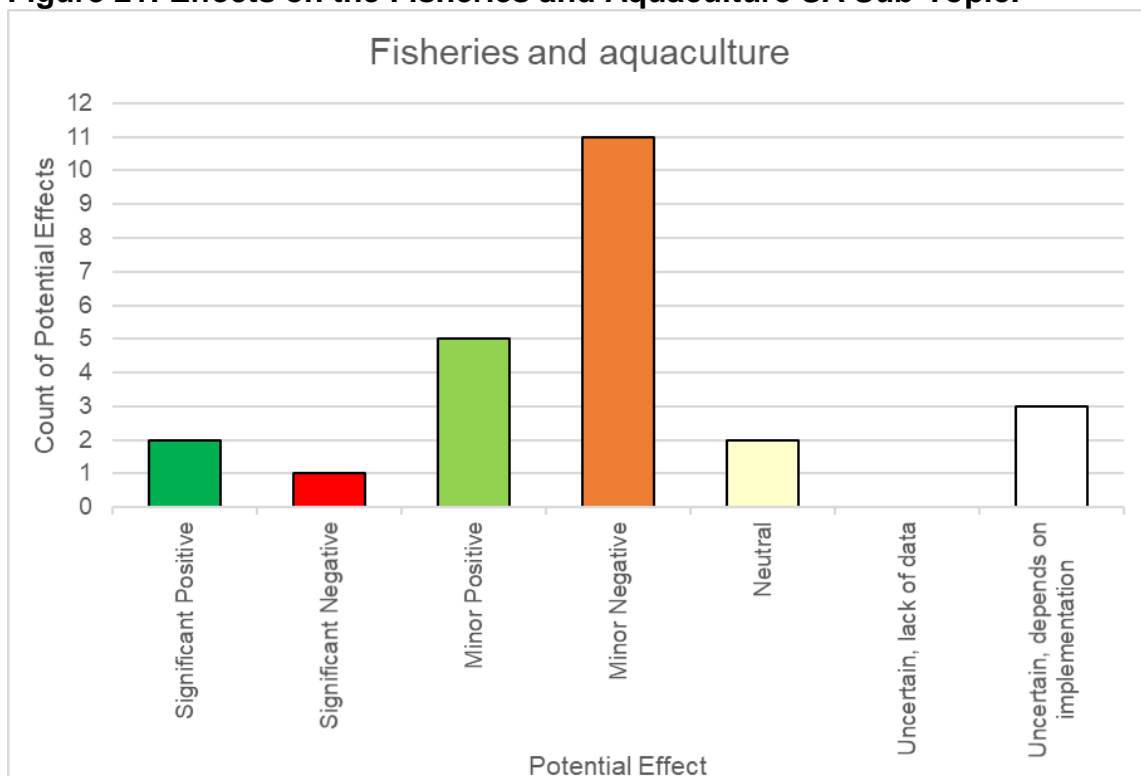

The presence of some energy generation devices may result in aggregation of fish, leading to a potential minor positive effect on fishing and energy generation.

However, it is unclear if fishing would be permitted near these installations, thus mitigating the effect through policy SE-FISH-6. Hence, an uncertain effect has been recorded.

Conversely, aquaculture and energy generation developments may alter the effectiveness of each other and may therefore compete for space. It is unclear from the aquaculture policy grouping policies, if aquaculture or energy generation developments would be given preference. It is also unclear if this policy grouping would be more lenient of adverse effects on aquaculture from renewable methods of energy. For these reasons, an uncertain effect has been identified.

11.2.4 Fisheries and Aquaculture

Figure 21: Effects on the Fisheries and Aquaculture SA Sub-Topic.

The fisheries policy grouping has potential to result in a significant positive effect on fisheries and to some extent aquaculture. Policies SE-FISH-1 and SE-FISH-2 support the use of sustainable fishing practices, as well as the ability of the industry to adapt to climate change.

The fishing industry has suffered decline in recent years, making it increasingly difficult to provide a livelihood. Policies SE-FISH-1 and SE-FISH-2 aim to protect fisheries and promote further development across the south east inshore marine plan area. Given that fishing is an important industry within the region the employment policy has the potential to result in significant positive effects, if new proposals align with local skills and strategies.

The marine protected areas policy grouping has the potential to cause a significant negative effect on fishing and aquaculture. As a result of the policy SE-MPA-1, fishing would be prohibited within the proposed Medway Nursery Area No Take Zone whilst the policy grouping as a whole may limit other aquaculture developments within this region.

Increased public access to marine areas is likely to increase recreational boating activity, which may conflict with fisheries and aquaculture industry. The increased levels of disturbance from boats could also lead to the altering of fish abundances and distributions. It is uncertain how policy SE-ACC-1 will be implemented, and how co-existence between enhanced public access and activities associated with the fisheries and aquaculture sectors would be managed. Uncertainty has therefore been recorded between the access policy grouping and the fisheries and aquaculture SA sub-topic.

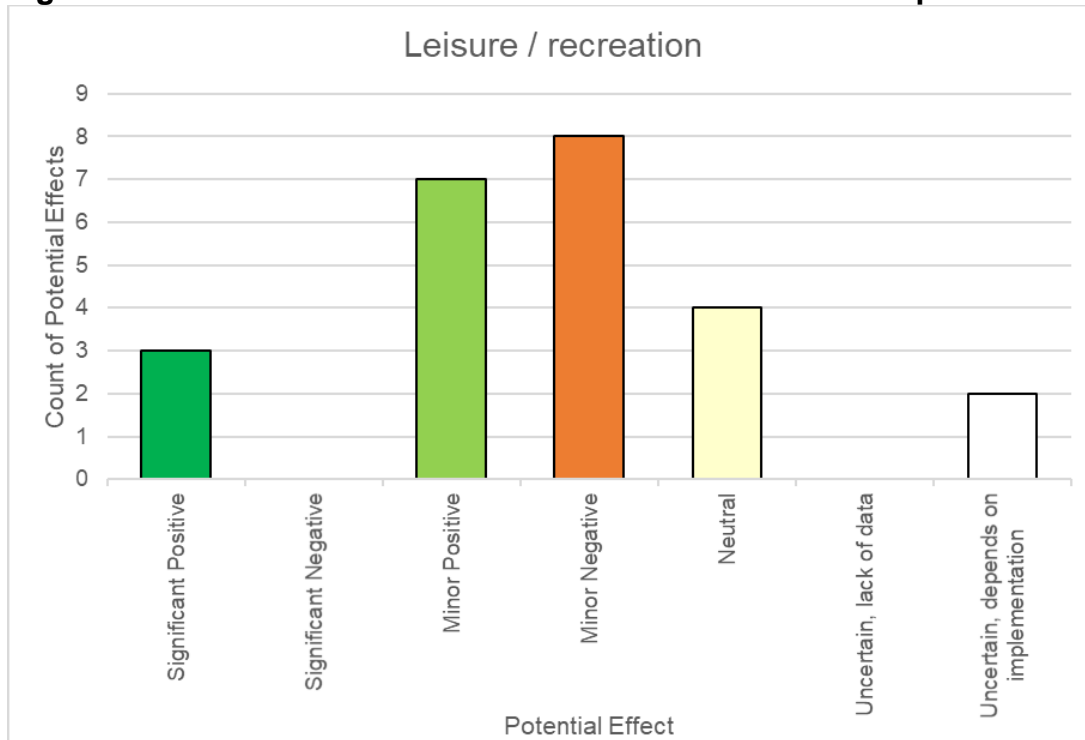

The South East has 200 employed persons in fishing both full-time and part-time. It has a GVA of £73 million, however as highlighted by the baseline, the fishing industry is dependent on a healthy marine environment. It is dependent on the marine environment being able to support healthy fish stocks which are free of persistent pollutants and heavy metals. It requires these fish stocks to be exploited sustainably, in order to ensure the long-term viability of the fishing sector. However, through its reliance on fish stocks as a natural capital asset, fishing itself has the potential to have a direct adverse effect on the marine environment. It also has the potential to have an indirect adverse effect on the marine environment (and thus several natural capital assets) through the presence of ghost fishing gear, and, in the case of aquaculture, the potential degradation of water quality. It is uncertain, therefore, how this cyclical and interdependent nature of fisheries and aquaculture on the natural capital assets (SE-NG-1) provided by the marine environment would affect the industry specifically.

The aquaculture policy grouping has the potential for a significant positive effect on fisheries and aquaculture, especially as the south east marine plan area has a comparatively high presence of aquaculture facilities. Policies directly address the need for future development to consider nearby aquaculture facilities and encourage sustainable design. However, the terms which would be acceptable for proposals which will adversely affect aquaculture are unclear. For this reason, an uncertain effect has been recorded.

Policy SE-SCP-1 states that where possible proposals should demonstrate that they have considered how highly the seascape and landscapes of an area is valued, its quality, and the areas with potential for change. In addition, the scale and design of the proposal should be compatible with its surroundings, and not have a significant adverse effect on the seascape and landscapes of an area or the wider landscape. At this stage, it is not clear the quality and value of the landscape and seascape where future proposals could be developed, or the process of which will be undertaken to establish the value. Therefore, at this stage the overall effect of SE-SCP-1 could have on aquaculture is uncertain.

11.2.5 Leisure and Recreation

Figure 22: Effects on the Leisure and Recreation SA Sub-Topic.

Both the access and tourism and recreation policy groupings aim to increase access to the marine environment providing greater leisure and recreational opportunities across the south east inshore marine plan area. For these reasons, significant positive effects have been identified.

Leisure and recreation opportunities have positive interactions with economic and social topics and implementation of policy SE-EMP-1 has the potential to result in significant positive effects on the leisure and recreation industry, through the provision of more jobs.

Sea training is carried out within the south east inshore marine plan area, with 17% of the inshore plan area, being dedicated as military practice and exercise (PEXA) training areas. Preference towards defence activities could see some recreational activity and new recreational proposals limited within the marine plan area, and there is potential for issues with relation to access. Uncertainty has been recorded as the proposals will need to be considered on a case by case basis and it is unclear from the policy wording which proposals would require authorisation.

The potential effect which may be had on leisure and recreation by the natural capital policy grouping is uncertain at present and would be dependent on its implementation. Leisure and recreation associated activities can benefit from the natural capital afforded by the marine environment (economic, outdoor recreation, increased visitor numbers), however, these activities may have a significant adverse effect on elements of marine and coastal natural capital.

11.2.6 Marine Manufacturing

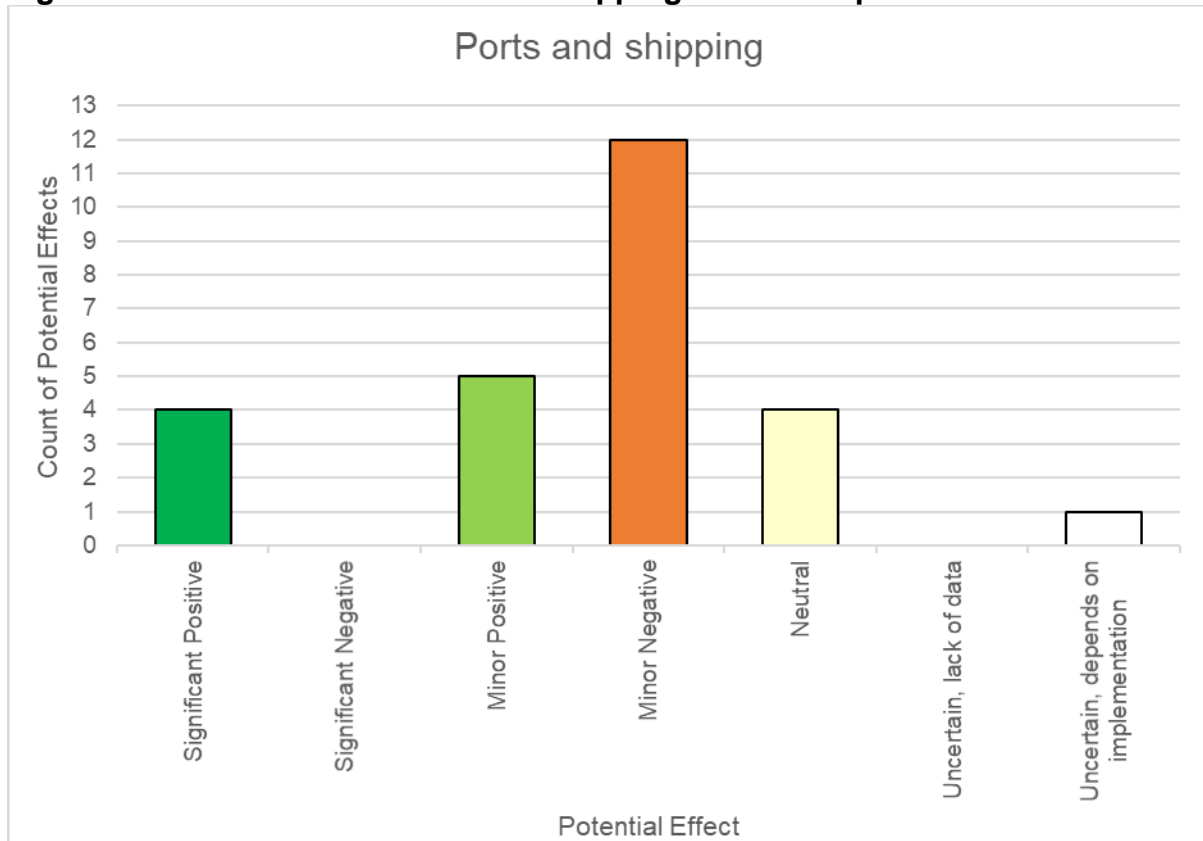

Figure 23: Effects on the Marine Manufacturing SA Sub-Topic.

No significant effects have been identified in relation to the marine manufacturing SA sub-topic.

11.2.7 Ports and Shipping

Figure 24: Effects on the Ports and Shipping SA Sub-Topic.

Potential significant positive effects have been identified in relation to the ports and shipping policy grouping. Policies SE-PS-2 and SE-PS-3 have the potential to help safeguard port access and key navigational routes, whilst policies SE-PS-1 and SE-PS-4 could increase port and shipping activity within the marine plan area. All four policies support existing shipping infrastructure as well as open up new opportunities for short-sea shipping.

SE-CO-1 policy supporting text highlights the importance of ports and harbours in the south east inshore marine plan area and their associated activities (e.g. dredging) to maintain access all year round. Navigational routes are also in operation throughout the year and require exclusive access for safety reasons. The policy supporting text has stated that the use of these areas for other purposes would need to consider their use of space at all times. It has therefore been assumed that Policy SE-CO-1 will support and maintain existing port activity within the region, so a significant positive effect has been identified for the co-existence policy grouping.

Ports and shipping have positive interactions with economic and social topics and the implementation of policy SE-EMP-1 has the potential to result in significant positive effects on the ports and shipping industry.

There is also potential for significant positive effects from the infrastructure policy grouping, specifically in regard to policy SE-INF-2. This policy aims to safeguard

existing landing facilities within the south east marine plan area, which in turn will help to support the ports and shipping sector.

Ports have a vital role in the import and export of energy supplies and will need to be responsive both to changes in different types of energy supplies needed, and to the need for facilities to support the development and maintenance of offshore renewable sites. Within the renewables policy grouping, there is potential for all three policies to result in significant positive effects on shipping. However, further development as well as the restrictions associated with areas designated for wind development (SE-WIND-1), will further reduce available space and add complexity to already challenging coastal waters.

11.2.8 Seabed Assets

Figure 25: Effects on the Seabed Assets SA Sub-Topic.

Potential significant positive effects have been identified in relation to the cables policy grouping. Policies SE-CAB-1, SE-CAB-2 and SE-CAB-3 aim to support existing cable infrastructure and encouraging new cable developments within the south east inshore marine plan area.

11.2.9 Tourism

Figure 26: Effects on the Tourism SA Sub-Topic.

The tourism and recreation policy grouping has resulted in significant positive effects on the tourism policy grouping. Policy SE-TR-1 aims to protect existing tourism activities and has the potential to result in expansion and diversification of existing developments as well as new proposals.

SE-CO-1 policy supporting text has highlighted that tourism and recreation activities in the south east inshore marine plan area are more popular in summer months and has therefore indicated that the optimisation of space, co-existence measures and co-operation between sectors is particularly important during these months. For this reason, a significant positive effect has been identified, in relation to the co-existence policy grouping.

The south east inshore marine plan area provides various tourism opportunities, which makes a substantial contribution to the UK's economy. Providing further employment opportunities and diversification, could result in more tourism opportunities, however, it is not clear whether tourism will be targeted by policy SE-EMP-1.

At present, the potential effect which may be had on tourism by the natural capital policy grouping is uncertain and would be dependent on its implementation. Tourism can derive numerous benefits from marine and coastal natural capital assets. Such benefits include, economic benefits, outdoor recreation opportunities, and increased visitor numbers. However, tourism itself may have a significant adverse effect on

elements of marine and coastal natural capital. Eco-tourism may somewhat reduce this interlinked dependency through enabling tourism which has minimum effect on marine natural capital.

Preference towards defence activity, in line with policy SE-DEF-1, could see some tourism activity and new tourism proposals limited within the marine plan area. Uncertainty has been recorded as the policy is not clear as to what types of proposals are likely to affect Ministry of Defence areas.

11.3 Suggested Mitigation Measures

Mitigation measures identified in the assessment to address potential uncertain or significant negative effects are identified within Table 9

Table 9: Suggested Mitigation Measures for Uncertain and Significant Negative Effects on Economy.

SA Sub-Topic	Causal Grouping	Mitigation Measures Identified in the Assessment
Fisheries and aquaculture	Access	<p>Whether adequate mitigation could be provided would be dependent on whether preference is given to the SA (sub) topic and associated activities or to the policy grouping and activities associated with this. This 'prioritisation' would ultimately be dependent on the project being proposed and the associated effects, and would be decided at a more granular level than the marine plan. As such, no further appropriate mitigation can be suggested.</p> <p>SE-FISH-1, SE-FISH-2, SE-FISH-3 and SE-CO-1 may provide some mitigation for the potential effects which may be incurred on fisheries and aquaculture as a result of increased access.</p>
Fisheries and aquaculture	Aquaculture	<p>The circumstances under which proposals with an adverse effect on aquaculture facilities would be accepted is unclear. Policy supporting text should explicitly state these cases.</p>
Fisheries and aquaculture	Aggregates and Dredging and disposal	<p>Policies SE-AQ-1, SE-FISH-2 and SE-FISH-3 aim to provide protection to aquaculture and fishing from activities that could have an adverse effect. The above policies do not specifically reference aggregates and give the options of minimising and mitigating effects of activities and developments. It is recommended that the wording of both the aggregates and/or AQ/FISH supporting text is changed to reflect the potential effect of aggregates on fisheries and aquaculture.</p> <p>Policy SE-CO-1 could also provide mitigation for fisheries and aquaculture, as it aims to optimise the use of space and incorporate opportunities for co-existence</p>

SA Sub-Topic	Causal Grouping	Mitigation Measures Identified in the Assessment
		and co-operation with existing activities, within the south east inshore marine plan area.
Fisheries and aquaculture, Leisure / recreation and Tourism	Natural capital	Clarity in the supporting text is required in relation to fisheries and aquaculture, to ensure that the cyclical and interdependent nature of this industry with natural capital assets within the marine and coastal environment are adequately and appropriately explained.
Aggregate extraction	Natural capital	At present there is no approved marine natural capital approach from government. We would anticipate that following an approved approach, clarity could be provided to the supporting text to state whether natural capital which benefits aggregate extraction is to be treated as preferential to other natural capital assets such as biodiversity which can be significantly affected by the industry.
Access, Leisure and recreation, Tourism	Defence	<p>Public access and restrictions within military areas are likely to be determined by MOD Byelaws.</p> <p>SE-DEF-1 may provide some mitigation. It aims to avoid conflict between defence activities and new proposals within the marine plan area. It will ensure that defence interests are not impeded. Supporting text for Policy SE-DEF-1 needs to be amended to highlight likely conflicting proposals.</p>
Fisheries and Aquaculture	Renewables	<p>Policy supporting text could be amended to address the potential negative effects that renewable energy could have. Policy SE-FISH-1 could provide some mitigation for the effects of renewable installations on fisheries and aquaculture.</p> <p>Policy SE-CO-1 could provide some mitigation with regards to co-existence.</p>
Marine Manufacturing	Water quality	In order to protect marine manufacturing, it should feature within the planning policies, whether this be within the supporting text to an existing economic policy (for example, infrastructure, defence etc.) or within its own policy.
Ports and shipping	Renewables	<p>It is assumed that any new developments arising as a result of the policies will require an updated navigational risk assessment in line with the Port Marine Safety Code.</p> <p>Policies SE-PS-1 and SE-PS-2 will ensure that important navigational routes will be safeguarded from static sea surface infrastructure.</p>

SA Sub-Topic	Causal Grouping	Mitigation Measures Identified in the Assessment
Aggregate extraction	Renewables	<p>SE-AGG-1 and SE-AGG-3 may work to reduce the potential restrictions which may be imposed on aggregate extraction as a result of the renewables policy grouping.</p> <p>Policy SE-CO-1 could provide some mitigation with regards to co-existence.</p>

DRAFT

12. Results of the Assessment - Biodiversity, Habitats, Flora & Fauna

12.1 Introduction

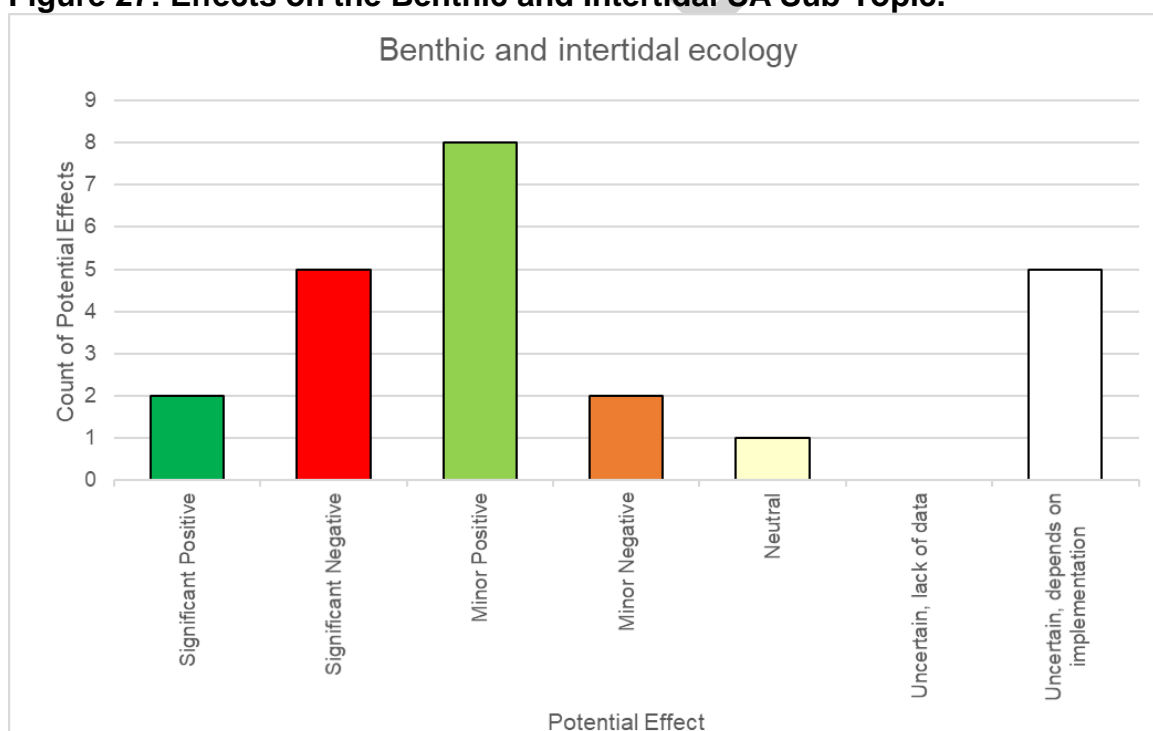

This section of the report presents the performance of the South East Marine Plan in relation to biodiversity, habitats, flora and fauna. This topic encompasses protected sites and species, benthic and intertidal ecology and fish and shellfish, marine megafauna, plankton, ornithology and invasive non-native species. Each of these comprises a separate SA sub-topic.

Sub-section 12.2 is split into seven parts, reflecting the seven SA sub-topics. The full assessment of the biodiversity SA topic can be found in Technical Appendix B.

12.2 Results of the Assessment of all Policy Groupings on Biodiversity, Habitats, Flora & Fauna

12.2.1 Benthic and Intertidal Ecology

Figure 27: Effects on the Benthic and Intertidal SA Sub-Topic.

The implementation of the marine protected areas policy grouping could have potential for significant positive effects on benthic and intertidal ecology. In particular, policies SE-MPA-2 and 3 may aid in increasing the adaptability of benthic and intertidal environments to the effects of climate change and make suitable arrangements for the spatial changes in distribution of habitat types. For these reasons, a significant positive effect has been recorded for the SA objective benthic and intertidal ecology.

Policy SE-CE-1 is predicted to have a significant positive effect on the benthic and intertidal environment, as it will address adverse cumulative effects from future proposals. For this reason, a significant positive effect has been identified, in relation to the cumulative effects policy grouping.

Associated port and shipping activity, in particular dredging, has potential to effect subtidal sediments and the baseline has identified that at various locations near large ports, subtidal rocky habitat has been lost due to construction, infrastructure (mainly coastal) or via smothering from dredged deposits. Shipping also poses the risk of water pollution which can indirectly affect benthic and intertidal ecology. Policies SE-PS-1 and SE-PS-4, within the ports and harbours policy grouping, could result in increasing port and shipping activity, which has the potential to cause a significant negative effect on benthic and intertidal ecology. Although, dredging policies themselves may not result in the additional dredging activity, any increasing in shipping could increase the need for dredging. Due to the interdependencies between these two policy groupings, a significant negative effect has been identified for both.

Aggregate activity has the potential to result in the degradation and/or loss of the seabed, adversely affecting benthic species and habitats. Although the policy may not result in further extraction sites within the south east marine plan area, the policies will safeguard existing aggregate sites. For these reasons, a significant negative effect has been identified.

The installation of buried subsea cables has the potential to disturb benthic and intertidal habitats. The impetus that the cable policy grouping gives to buried cables has resulted in a significant negative effect particularly on benthic habitats within the marine plan area. Subtidal sediment and habitats are also currently being lost as a result of offshore activities and subsequent pollution. The oil and gas policy grouping encourages future development of oil and gas, which has the potential to result in further degradation of benthic and intertidal ecology within the marine plan area. For these reasons, potential significant negative effects have been identified in relation to both the oil and gas and cable policy groupings.

The aquaculture policy grouping also has potential to have a significant negative effect on benthic and intertidal ecology. This policy grouping promotes aquaculture developments, particularly policy SE-AQ-2, which could lead to an increase in the nutrients and pollutants present within benthic and intertidal sediments, altering species composition.

Benthic and intertidal ecology is being heavily affected by a number of industries within the marine plan area (for example, aggregates, dredging, fishing, cables and recreation). The supporting text for Policy SE-CO-1 aims to help protect habitats and species, but it also aims to protect industries that are damaging to benthic and intertidal habitats. The policy text discusses existing activities and does not make reference to opportunities to improve the performance of existing activities with relation to their potential negative effects through co-existence. There is no indication within the supporting text whether the protection of industries or the protection of habitats take priority. For these reasons, an uncertain effect has been identified, in relation to the co-existence policy grouping and benthic and intertidal ecology.

Uncertainty has been recorded in regard to the disturbance policy grouping. The SE-DIST-1 policy option does not protect benthic or intertidal habitats; or sessile species from the effects of disturbance, which could lead to the irreversible loss of benthic and intertidal environments within the marine plan area. Whilst SE-BIO-2 may have the potential to mitigate for this, it is uncertain that the "significant adverse effects on native species" would include the effects of disturbance.

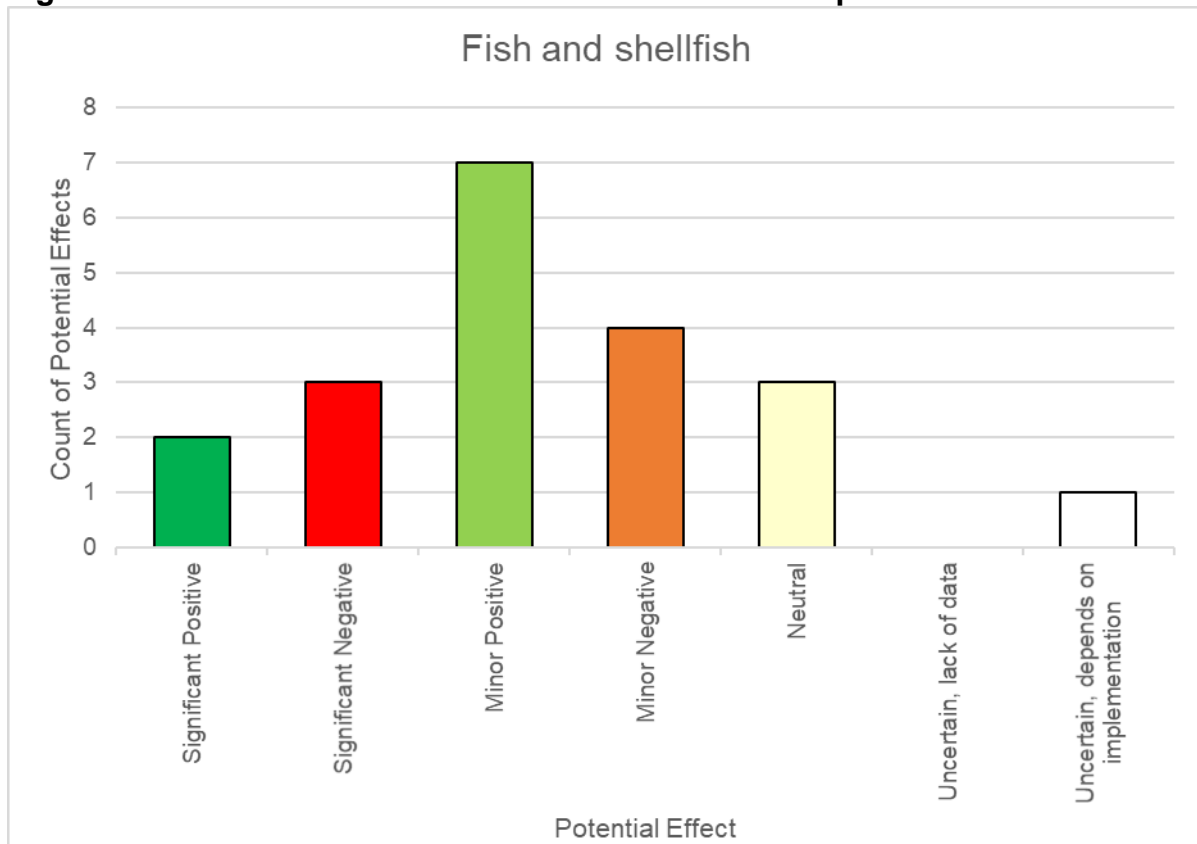

Renewable energy device infrastructure has potential to result in adverse effects on the hydrodynamics of estuarine environments and can affect intertidal and subtidal habitats. The renewable policy grouping has the potential to result in further renewable activity within the south east inshore marine plan area, however, the likelihood of future proposals and the type of future proposals is not known. For these reasons an uncertain effect has been identified.

Subtidal sediment and habitats have the potential to be lost as a result of offshore activities and subsequent pollution. At present, there are no oil or gas fields or terminals in the south east inshore marine plan area and no currently licenced areas to be awarded or offered by the Crown Estate. It is therefore unlikely that policies SE-OG-1 and SE-OG-2, that offer safeguarding, will result in future developments, however, this can't be known for certain. If developments were to come forward, there is potential for negative effects to occur. The potential effects of CCUS are not fully known; however, the baseline has stated that these are likely to be similar to oil and gas. However, it is not clear if policy CCUS-2 would explicitly lead to future CCUS activity in the marine plan area.

Commercial fishing can cause adverse effects on subtidal sediments, resulting in the loss of benthic habitats and species. Whilst policy SE-FISH-3 seeks to protect essential fish habitat, it is unclear whether this would apply only to fish habitat of commercially important species. This would not facilitate the direct protection of benthic and intertidal ecology. The potential effect that the fisheries policy grouping could have is at present uncertain and dependent on implementation.

12.2.2 Fish and Shellfish

Figure 28: Effects on the Fish and Shellfish SA Sub-Topic.

The south east inshore marine plan area has a high density of fish spawning grounds for plaice and sole, and nursery grounds for herring and sole. The SE-CO-1 policy supporting text has identified the importance of this and has stated that it will optimise the use of these important grounds and consider seasonal use to accommodate sensitive life stages for local species. This could avoid adverse effects upon these species. This will help to protect fish and shellfish within the region and for this reason a significant positive effect has been identified.

The invasive non-native species policy grouping has the potential to positively effect native fish and shellfish populations, such as the salmon and sea trout populations of the Thames. It clearly outlines the need to prevent the introduction of invasive non-native species through transport and construction, which could subsequently compete with native species. For this reason, a significant positive effect has been recorded.

Dredging and dredge disposal has the potential to lead to the loss of subtidal rocky habitats from both direct removal or smothering from dredge deposits. Although the dredging and disposal policies will not explicitly result in increased dredging activity, due to the numbers of ports that currently require dredging within the south east inshore marine plan area, the significant negative effects that are currently occurring, are likely to continue. For these reasons, a significant negative effect has been identified.

The increased number of aquaculture facilities which could result from the aquaculture policy grouping, may have positive effects on local fish and shellfish species, for example, the structures may act as an aggregating device. However, unless carefully managed, there is potential for increased eutrophication, altering of food sources and increased disease transmission. For this reason, a potential significant negative effect has been identified.

There is potential for an indirect significant negative effect to result from the underwater noise policy grouping, as Policy SE-UWN-2 may still allow for developments causing noise due to caveats within the policy, which has potential to disturb fish.

Policy SE-FISH-3, within the fisheries policy grouping, seeks to protect habitat of essential fish, however, it is unclear whether this would apply only to habitats of commercially important species, and as it stands it would not include the direct protection of other fish and shellfish. The potential effect that the fisheries policy grouping is uncertain and would be dependent on implementation.

12.2.3 Marine Megafauna

Figure 29: Effects on the Marine Megafauna SA Sub-Topic.

Aggregate activity can result in increased noise. The production of noise in the marine environment can have varying effects on marine mammals, including the alteration of feeding behaviour, increased energy expenditure and death due to altered dive patterns. Although aggregate policies may not result in further extraction

sites within the south east marine plan area, the policies will safeguard existing aggregate sites.

Ports and shipping activity can increase disturbance as well as potential collisions, with marine megafauna. This can cause increased energy expenditure, reduced resting time and has the potential to cause cetaceans to abandon or not use ideal habitats, which could result in a reduction of energy reserves which could affect foraging efficiency, overall fitness and reproductive capacity. For these reasons, potential significant negative effects have been identified.

Noise effects from marine dredging are already having an effect on marine megafauna within the south east inshore marine plan area. The dredging and disposal policy grouping could result in further dredging activity within the marine plan area, worsening the current situation, and for this reason a significant negative effect has been identified.

There is a potential direct significant negative effect from the implementation of the underwater noise policy grouping due to caveats of policy SE-UWN-2, which allows for noise emitting developments to occur in some cases without mitigation. This could lead to the altering of megafauna migration pathways, interruption of predation and lead to increased energy expenditure, lowering organism fitness. Similarly, noise effects from marine dredging are already having an effect on marine megafauna within the marine plan area. The policy has the potential to result in further dredging activity within the marine plan area, worsening the current situation, and for this reason a significant negative effect has been identified, with regards to the dredging and disposal policy grouping.

Offshore energy and CCUS development have potential to increase noise, which is likely to be significantly worse during construction. The production of noise in the marine environment can have varying effects on marine mammals, including the altering of feeding behaviour, increased energy expenditure and death due to altered dive patterns. There are no oil or gas fields or terminals in the south east inshore marine plan area and no currently licenced areas to be awarded or offered in the south east marine area. It is therefore unlikely that policies SE-OG-1 and SE-OG-2 that offer safeguarding will result in future developments, however, this can't be known for certain. If developments were to come forward, there is potential for negative effects to occur. The potential effects of CCUS are not fully known; however, the baseline has stated that these are likely to be similar to oil and gas. However, it is not clear if policy CCUS-2 would explicitly lead to future CCUS activity in the marine plan area.

Bycatch of marine mammals by fisheries and their entanglement by marine litter are two separate issues which could be exacerbated by the fisheries policy grouping. Neither of these issues are addressed by the policy grouping, and whilst the latter is partially addressed by policy SE-ML-2, the former is not addressed by other policies within the plan, hence a potential significant negative effect has been recorded.

Marine megafauna are often highly migratory species, and may therefore experience the cumulative effects originating within multiple plan areas. It is unclear if the cumulative effects identified within the cumulative effects policy grouping will extend

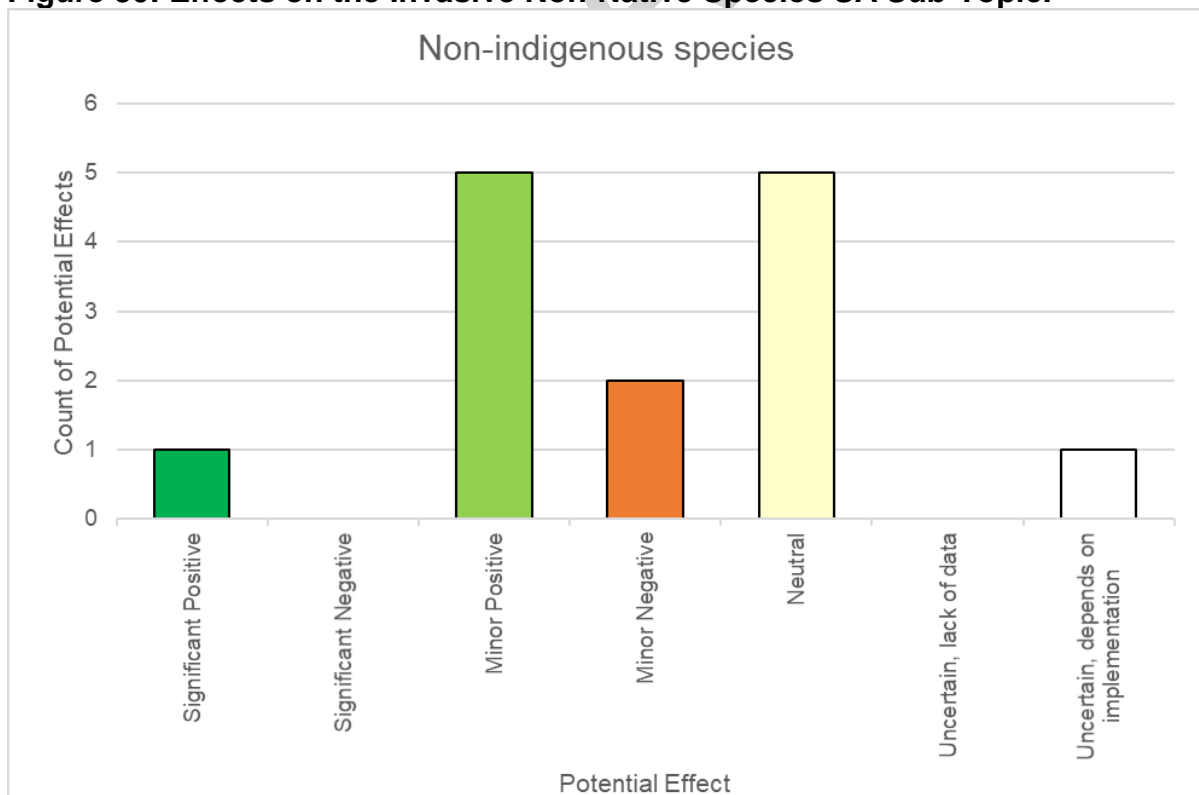

to those which are cross-boundary cumulative effects. Therefore, an uncertain effect has been recorded.

At present the potential effect of the natural capital policy on marine megafauna is uncertain and would be dependent on its implementation. Marine megafauna provide natural capital through, for example, eco-tourism and wildlife tours. However, these activities have been identified as having potential negative effects on marine megafauna. In addition, other sectors which make use of seismic surveys, piling, dredging, defence and shipping can also have negative effects on marine megafauna which themselves relying on marine natural capital. It is therefore unclear which natural capital asset, and which sector's exploitation of such an asset, would be prioritised through the implementation of policy SE-NG-1.

Megafauna provide popular recreational attractions within the south east region; however, recreational disturbances are regularly recorded, which often affects seals, cetaceans and sharks. Disturbances are often caused by dogs, boats, surfers canoes and paddle boards. The tourism and recreation policy grouping could result in increased recreational pressures on marine megafauna which has potential to worsen the problem. It is uncertain what 'sustainable tourism and recreation activities' entail, and therefore whether the policy grouping would address disturbance issues.

12.2.4 Invasive Non-Native species

Figure 30: Effects on the Invasive Non-Native Species SA Sub-Topic.

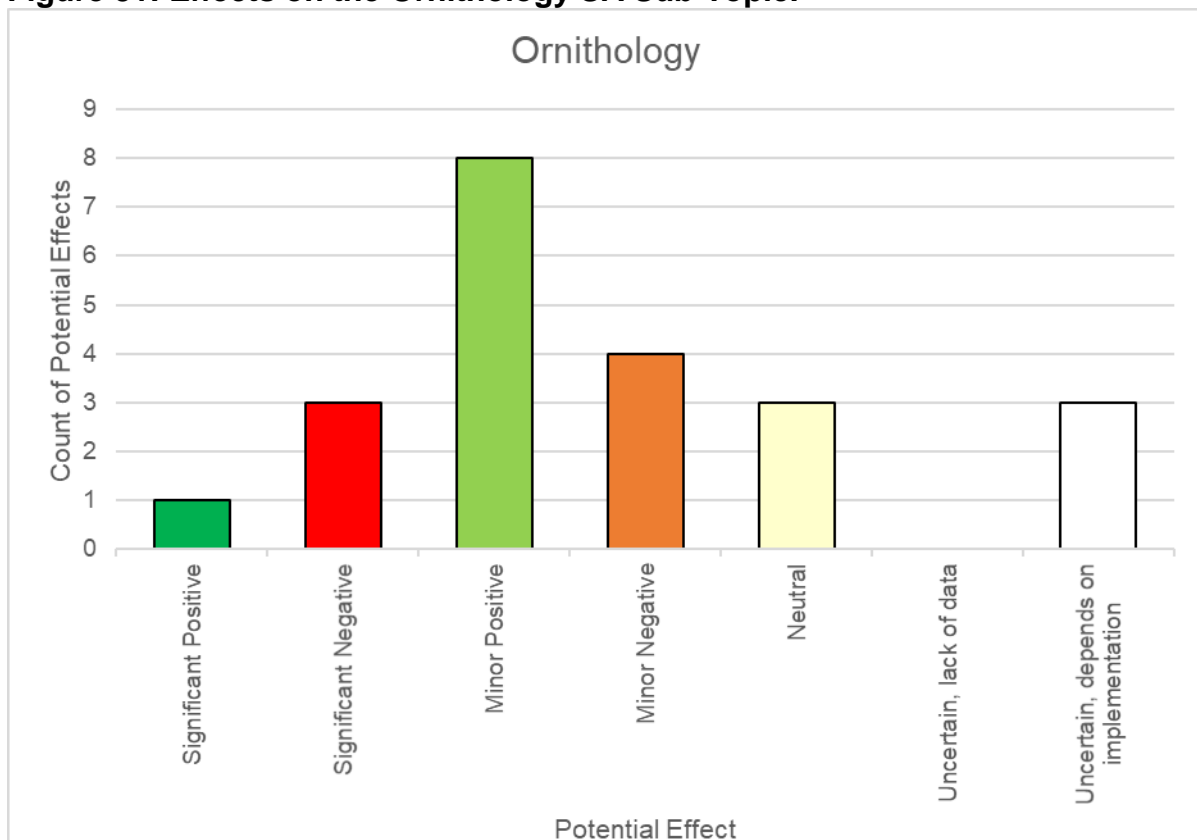

The invasive non-native species policy grouping directly aims to prevent the introduction and increase of invasive non-native species throughout the marine plan

area. Transport of these species, as well as areas of potential colonisation are addressed within the invasive non-native species policy grouping, which should help to form a well rounded approach to tackling this issue. For this reason, a significant positive effect has been recorded.

It is unclear if invasive non-native species will be given the same protection as native species from disturbance, as described in by policy SE-DIST-1, within the disturbance policy grouping. For this reason, an uncertain effect has been recorded.

12.2.5 Ornithology

Figure 31: Effects on the Ornithology SA Sub-Topic.

The majority of the south east marine plan area estuaries are designated as internationally important sites reflecting their use by wintering water birds. The baseline has identified issues relating to marine developments and the displacement of Red-Throated Divers within the Outer Thames Special Protection Area (SPA). Aggregate and dredging activity have potential to lead to the disturbance and displacement of seabirds, worsening the current baseline situation. For this reason, a significant negative effect has been identified, with regards to the aggregate grouping.

The estuaries and intertidal areas within the south east inshore marine plan area support important wintering waders and waterfowl populations, as well as breeding tern colonies. SE-CE-1 supporting text has highlighted the significance of this and the need to protect them. It has also identified the need to optimise the use of space to avoid adverse effects upon these species especially during the important winter

season, when populations are significantly larger. The co-existence policy grouping is likely to result in further protection for the south east inshore marine plan area bird populations, and for this reason a significant positive effect has been identified.

The baseline has identified issues relating to marine developments and the displacement of Red-Throated Divers within the Outer Thames SPA. Although aggregate policies may not result in further extraction sites within the south east inshore marine plan area, the policies will safeguard existing aggregate sites.

Shipping activity can negatively affect birds, mainly through disturbance and displacement. Given the national and international importance of bird populations in the south east inshore marine plan area, there is potential for significant negative effects as a result of policies SE-PS-1 and SE-PS-4.

Oil, gas and CCUS activities have potential to cause disturbance and displacement of the movement of species through the marine plan area. The south east inshore marine plan area is identified as an important area for seabirds, wintering waders and waterfowl populations. If development were to come forward, there is potential for a significant negative effect. There are no oil or gas fields or terminals in the south east inshore marine plan area and no currently licenced areas to be awarded or offered in the south east marine area. It is therefore unlikely that policies SE-OG-1 and SE-OG-2 that offer safeguarding will result in future developments, however, this can't be known for certain. If developments were to come forward, there is potential for negative effects to occur. The potential effects of CCUS are not fully known; however, the baseline has stated that these are likely to be similar to oil and gas. However, it is not clear if policy SE-CCUS-2 would explicitly lead to future CCUS activity in the marine plan area.

Ornithology provides popular recreational attractions within the south east inshore marine plan area; however, recreational disturbances are regularly recorded. The tourism and recreation policy grouping could result in increased recreational pressures on marine megafauna which has potential to worsen the problem. It is uncertain what 'sustainable tourism and recreation activities' entail, and therefore whether this policy grouping would address issues with increased tourism resulting in increased disturbance on bird species.

Uncertainty has also been recorded in relation to the cumulative effects policy grouping as it is unclear if the cumulative effects identified within SE-CE-1 grouping will extend to those which are cross-boundary cumulative effects. Bird species are often highly mobile and migratory and may therefore experience the cumulative effects across multiple plan areas.

12.2.6 Plankton

Figure 32: Effects on the Plankton SA Sub-Topic.

At present, the potential effects of the biodiversity policy grouping are uncertain and would be dependent on the policy implementation. Plankton are the basis of all marine food webs, including those of commercially important species. They are affected by several indirect anthropogenic drivers, including warming sea temperatures and ocean acidification as a result of climate change, and eutrophication through nutrient run-off. As policies SE-BIO-1, SE-BIO-2 and SE-BIO-3 do not seek to target these drivers which are causing permanent and irreversible damage to plankton populations and communities, it is not clear that their implementation would be beneficial for this SA sub-topic. It is uncertain whether net environmental gains which may be sought as a compensatory route would encompass plankton.

Indirect positive effects may be had on plankton through renewable energy policy grouping, as it could indirectly reduce the effects of climate change, such as changes to water temperature and salinity, and through having the potential to minimise demand on fossil fuel generated energy which could in turn minimise carbon dioxide emissions and subsequent ocean acidification. There is however a lack of data on how or whether marine renewable devices can have an adverse effect on plankton, particularly in light of the baseline, which highlights that heavy manufacturing which has a coastal or estuarine location can potentially have a number of effects on the environment and effects on the water environment is a key one. During the construction, operation and decommissioning phases of developments, there can be increased demand for water, discharges to water and adverse ecological effects

resulting from physical modifications to the water environment. For these reasons, an uncertain effect has been identified.

12.2.7 Protected Sites and Species

Figure 33: Effects on the Protected Sites and Species SA Sub-Topic.

Marine Protected Areas within the south east inshore marine plan area present co-existence challenges with other activities (for example, anchorage, dredging, fisheries, recreational activities), which is mainly due to the number of Marine Protected Areas and the variety of management measures within them. SE-CO-1 policy supporting text has identified the high sensitivity of Special Protected Areas within the marine plan area, and the important socio-economic benefits that they can provide. It aims to provide exclusive access to other suitable activities that do not pose a risk to the designated features of protected sites. Providing sensitive access to protected sites is likely to reduce the current recreational pressure faced within these important areas. For this reason, a significant positive effect has been identified in relation to the co-existence policy grouping.

The implementation of the cumulative effects policy grouping is predicted to have a significant positive effect on protected sites and species, as cumulative effects resulting from future developments must be addressed and mitigated. The addition of mitigating cumulative effects which may later arise from "reasonably foreseeable proposals" adds strength to the cumulative effects policy grouping and further protection for protect sides and species.

The baseline has identified the potential for a negative effect from aggregate extraction on the Outer Thames SPA and the Margate and Long Sands SAC. For

this reason, a potential significant negative effect has been identified as a result of the aggregates policy grouping.

There is potential for an indirect significant negative effect to result from the underwater noise policy grouping, as Policy SE-UWN-2 may still allow for developments causing noise due to caveats within the policy, which has potential to disturb protected sites and species.

Shipping activity can negatively affect protected sites and species from disturbance. The ports and harbours policy grouping could result in further shipping activity within the south east inshore marine plan area, which has the potential to increase levels of disturbance. For this reason, a significant negative effect has been identified for the ports and harbours policy grouping.

Fisheries pose a threat to vulnerable or rare species, and there is a lack of understanding of the purpose of Marine Conservation Zones within the sector. Whilst policy SE-FISH-3 seeks to protect essential fish habitat, it is unclear whether this would apply only to fish habitat of commercially important species. This would not include the direct protection of protected sites and species. The potential effect that these policies could have is dependent on implementation. It is however noted that if SE-FISH-3 were to protect sites close to the Medway No Take Zone, the Zone could potentially experience minor positive effects through, for example, the recruitment of juvenile fish which have been afforded protection by this policy. For these reasons, an uncertain effect has been identified.

The tourism and recreation policy has the potential to result in increased recreational activity within the marine plan area. Recreational pressures can result in disturbance of both protected sites and species. It's not clear what 'sustainable tourism and recreation activities' could entail, and for this reason an uncertain effect has been identified.

Whilst it is assumed that installation of renewable energy devices should not affect protected sites and species, an EIA should be carried out if any new proposals were to come forward. This may be particularly pertinent to mobile protected species. Indirect positive effects may be had on protected sites and species through renewable energy generation indirectly reducing the effects of climate change on protected sites and species, such as coastal squeeze and changes to water temperature and salinity, and through having the potential to minimise demand on fossil fuel generated energy which could in turn minimise carbon dioxide emissions and subsequent ocean acidification. Whether the positive or negative effects identified within this assessment outweigh the other would be dependent on the implementation of the renewables policy grouping.

12.3 Suggested Mitigation Measures

Mitigation measures identified in the assessment to address potential uncertain or significant negative effects are identified within Table 10.

Table 10: Suggested Mitigation Measures for Uncertain and Significant Negative Effects on Biodiversity, Habitats, Flora & Fauna.

SA Sub-Topic	Causal Grouping	Mitigation Measures Identified in the Assessment
Protected sites and species, ornithology	Tourism and recreation	<p>Policy supporting text needs to provide clarification on what 'sustainable tourism and recreation activities' entails.</p> <p>Strength could be added to policy SE-MPA-1 by removing options to minimise and mitigate.</p>
Protected sites and species, ornithology, fish and shellfish	Renewables and Aggregates	<p>If future renewable energy proposals were to come forward, the potential negative effects on protected sites and species will need to be addressed through the EIA process.</p> <p>The Crown Estate leasing process and other required consenting schemes also ensures that sensitive biodiversity receptors are taken into account during these processes and conditions frequently applied to limit effects.</p>
Marine megafauna	Access	<p>SE-BIO-1, SE-BIO-2 and SE-BIO-3 may aid in alleviating some negative effects. However, the caveats within this policy grouping allowing for environmental net gains to be used as mitigation elsewhere, may still mean that megafauna within the south east inshore marine plan area are adversely affected. A minor negative rather than significant effect has been recorded due to the mitigation provided by these other plan policies.</p> <p>Policy SE-BIO-1, SE-DIST-1, SE-UWN-1 and SE-UWN-2 could help to mitigate the cumulative effect, although only 'highly mobile' species will be protected by SE-DIST-1.</p>
Ornithology	Access	<p>Policies within groupings such as those for Marine Protected Areas (SE-MPA-1) and Biodiversity (SE-BIO-2), may help to mitigate these effects. A minor negative rather than significant effect has been recorded due to the mitigation provided by these other plan policies.</p> <p>Policy SE-BIO-2 and SE-DIST-1 could help to mitigate the cumulative effect, although only 'highly mobile' species will be protected by DIST-1.</p>
Ornithology	Aggregates	<p>Policy SE-MPA-1 may offer further protection to Marine Protected Areas through discouraging proposals which may have adverse effects on the objectives of marine protected areas.</p>

SA Sub-Topic	Causal Grouping	Mitigation Measures Identified in the Assessment
Benthic and intertidal ecology	Aquaculture	It should be clear within supporting text that "where appropriate" refers to sites which are not protected, and that direct building on the seabed is to be minimal. For example, raised cages within the water column, which are anchored by several points on the seabed.
Benthic and intertidal ecology, Fish and shellfish, Ornithology, protected sites and species and marine megafauna	Ports and harbours	All new ports and harbours proposals would need to be subject to an EIA, which would assess the potential effect on benthic intertidal ecology, fish and shellfish, ornithology, protected sites and species and marine megafauna. This could mitigate both potential negative effects and cumulative effects arising from development.
Marine Megafauna, Ornithology, Invasive non-native species	Climate change	<p>SE-AIR-1 seeks to avoid increased greenhouse gas emissions.</p> <p>SE-FISH-1 supports a sustainable fishing industry, however this focuses on diversification and may not necessarily alleviate pressure on over-exploited fish stocks.</p> <p>SE-ML-1 and SE-ML-2 seek to reduce the quantity of litter within the marine environment, however its introduction will not necessarily be wholly prevented.</p> <p>No policies within the marine plan broach the issue of bycatch of unintended species, including marine mammals, within fishing gear.</p> <p>A neutral rather than negative effect has been recorded due to the mitigation provided by these other plan policies.</p>
Protected sites and species, Benthic and intertidal ecology, Fish and shellfish	Fisheries and aquaculture	The policy wording of SE-FISH-3 should be amended to explicitly state whether either important habitats of commercially important species should be protected, or whether this extends to important habitats of other species, including protected sites and species, such as benthic and intertidal species and fish and shellfish.
Benthic and intertidal ecology	Oil and gas	Supporting text to policy SE-BIO-2, should be amended to highlight the importance of benthic and intertidal habitats. Strength could be added to the policy by removing options to minimise and mitigate.
Marine megafauna and ornithology	Tourism and recreation	Supporting text for policy SE-TR-1 needs to clearly identify what is meant by 'sustainable

SA Sub-Topic	Causal Grouping	Mitigation Measures Identified in the Assessment
		tourism and recreational activities' and highlight the importance of water quality to tourism and recreation.
Benthic and intertidal ecology	Aquaculture	It should be clear within supporting text that "where appropriate" refers to sites which are not protected, and that direct building on the seabed is to be minimal. For example, rope methods which are often used for shellfish farms.
Fish and shellfish	Aquaculture	<p>Controls should be put in place to ensure native populations are not hindered by the presence of farmed species within the water column. Disease control should be addressed, as well as aquaculture facility density. Whilst it is recognised that this is outside the remit of the MMO, the supporting text could signpost to relevant good practice, such as the CEFAS Shellfish Biosecurity Measures Plan.</p> <p>SE-BIO-2 and SE-FISH-3 could partially mitigate for the effects identified.</p>
Plankton	Biodiversity	<p>The most applicable definition of 'net environmental gain' as included within the supporting text extends only to mean low water. It is therefore recommended that a definition is included within the supporting text for both the biodiversity policy grouping, else for the policy/supporting text to signpost to the most relevant and recent advice. The same approach should be taken for the Natural Capital grouping, to ensure that the policies encompass the marine environment and are therefore applicable to proposals within the marine plan area.</p>
Benthic and intertidal ecology	Co-existence	There is no indication within the supporting text whether the protection of industries or the protection of habitats take priority. SE-BIO-1, SE-BIO-2 and SE-BIO-3 and provide some mitigation but do not specifically reference benthic and intertidal ecology.
Ornithology	Natural Capital	It should be clarified within the supporting text whether activities such as tourism which derive economic benefits from ornithology as a natural capital asset would take precedence over the protection of ornithology which is the natural capital asset.

SA Sub-Topic	Causal Grouping	Mitigation Measures Identified in the Assessment
		<p>It is also noted that the most applicable definition of 'net environmental gain' as included within the supporting text of the Biodiversity grouping extends only to mean low water. It is therefore recommended that a definition is included within the supporting text for both the Natural Capital and the Biodiversity groupings which encompasses the marine environment and is therefore applicable to proposals within the marine plan area.</p>
Marine megafauna	Natural Capital	<p>At present there is no approved marine natural capital approach from government. We would anticipate that following an approved approach, clarity could be provided within the supporting text to state whether natural capital which is derived from marine megafauna is treated preferentially and takes priority over exploitation of other natural capital assets (aggregate extraction, dredging etc.).</p> <p>It is also noted that the most applicable definition of 'net environmental gain' as included within the supporting text of the Biodiversity grouping extends only to mean low water. It is therefore recommended that a definition is included within the supporting text for both the Natural Capital and the Biodiversity groupings which encompasses the marine environment and is therefore applicable to proposals within the marine plan area.</p>
Ornithology	Natural Capital	<p>At present there is no approved marine natural capital approach from government. We would anticipate that following an approved approach, clarity could be provided within the supporting text to state whether activities such as tourism which derive economic benefits from ornithology as a natural capital asset would take precedence over the protection of ornithology which is the natural capital asset.</p> <p>It is also noted that the most applicable definition of 'net environmental gain' as included within the supporting text of the Biodiversity grouping extends only to mean low water. It is therefore recommended that a definition is included within the supporting text for both the Natural Capital and the Biodiversity groupings which encompasses the marine environment</p>

SA Sub-Topic	Causal Grouping	Mitigation Measures Identified in the Assessment
		and is therefore applicable to proposals within the marine plan area.
Ornithology	Dredging and disposal	<p>Policy SE-BIO-3 encourages proposals to enhance habitats and promote net gains, which could help to protect birds from negative effects associated with dredging and disposal.</p> <p>Policy SE-DIST-1 could provide some mitigation, however, supporting text should be amended to identify the potential effect dredging and disposal activities pose.</p>
Plankton	Renewables	<p>The Crown Estate leasing process and other required consenting schemes also ensures that sensitive receptors are taken into account during these processes and conditions frequently applied to limit effects.</p> <p>More data is needed on the potential effects of marine renewable energy devices on the water column and subsequently on plankton.</p>

DRAFT

13. Cumulative Effects Assessment

13.1 Introduction

The SEA Regulations require an assessment of cumulative effects. Cumulative effects arise where:

- several individual effects of the plan have a combined effect on a single receptor and/or
- where several plans and policies each have insignificant effects but together have a significant effect.

The significance of cumulative effects resulting from a range of activities, or multiple incidences of one activity, may vary based on factors such as the nature of the projects proposed and the sensitivity of the receiving communities and environment.

The cumulative effects assessment therefore includes:

- consideration of how different aspects of the South East Marine Plan may interact to cause cumulative effects on a receptor and
- how the South East Marine Plan can cause cumulative effects in association with other programmes, plans, policies and projects.

Potential cumulative effects of different elements of the South East Marine Plan which may have a combined effect are reported in Section 13.2.

Potential cumulative effects of the South East Marine Plan in association with other programmes, plans, policies and projects are presented in Section 13.3.

13.2 Potential Cumulative Effects of all Policy Groupings

Should multiple proposals from within a single sector or from a combination of sectors come forward which would be located within relatively close proximity to one another, there is the potential for negative cumulative effects to be had on SA topics. The damage which may be incurred as a result of potential cumulative effects would have the potential to vary, dependent on:

- the nature (susceptibility to damage) and spatial extent of the features in question
- the installation methods opted for
- the proximity of future developments to designated sites or features
- the type and number of proposals, policies or developments which may come forward
- how different policies address common issues
- the preference given to certain policies.

Cumulative effects which have been identified as having potential to occur on features within the South East marine plan area as a result of proposals from various industries have been summarised in Table 11 and described within Table 12.

				<p>negative cumulative effects arising from economic developments.</p> <ul style="list-style-type: none"> • Policy SE-BIO-1, SE-BIO-2 and SE-BIO-3 and encourage proposals to enhance habitats. SE-BIO-3 promotes net gains which could provide mitigation for ornithology from economic developments. • SE-INNS-1 may partially mitigate for the cumulative effect identified specifically in relation to aquaculture, although the release of invasive non-native species from aquaculture sites cannot be ensured through this • The Crown Estate leasing process and other required consenting schemes also ensures that sensitive biodiversity receptors are taken into account during these processes and conditions frequently applied to limit effects. This could mitigate negative cumulative effects arising from aggregates and renewables

SA topic	Cumulative effects vary dependant on:	Potential Negative cumulative effects	Potential positive cumulative effects	Mitigation
				<ul style="list-style-type: none"> Policy SE-MPA-1 could provide some protection to marine protected areas.

DRAFT

13.3 Cumulative Effects from Existing Plans and Policies

The SA Database in Appendix A was reviewed for plans and policies which may give rise to significant effects as follows:

- International plans, policies and strategies
- National plans, policies and strategies
- Regional plans, policies and strategies.

Legislation from the database is not included in the review as it is assumed that this will be complied with. The MPS was also not included separately as it requires implementation of the marine plans. Effects from other marine plans are included so effects of the MPS have been identified at a regional level. Local Plans are considered cumulatively, but beyond this level of planning, individual local or area action plans are not identified individually. This is because, given the spatial scale of the broad policies and geographic areas identified in the plan, it is more appropriate to identify the higher tier plans and policies which identify the same effects, but at a regional or national level. It should also be noted that at the strategic level, this list is not exhaustive and cumulative effects arising from individual projects and plans should be revisited as part of their assessment at the application stage.

Further, the MMO conducted a sub-national policy analysis exercise which aimed to take into account interactions between terrestrial and marine planning. This analysis formed part of the evidence base when developing policies for the marine plan area within this assessment and should therefore help mitigate any adverse effects or conflicts caused by the marine plans in combination with terrestrial planning.

Table 14 presents the reviewed plans, policies and strategies and identifies potential cumulative effects that could result from them in combination with the South East Marine Plan.

The majority of the policies and plans assessed in Table 4 will result in positive cumulative effects. This is because they strengthen environmental protection, for example by reducing greenhouse gas emissions, improving air or water quality, protecting designated sites for nature conservation, landscape or the historic environment. However, there is potential for development to cause negative cumulative effects, particularly where development in adjacent terrestrial or marine areas can act in-combination to affect receptors. There are a number of policies within the South East Marine Plan which do help to mitigate these effects:

- Cumulative Effects Policy SE-CE-1
- Natural Capital Policy SE-NG-1
- Co-existence Policy SE-CO-1
- Cross boundary considerations Policy SE-CBC-1
- Environmental protection policies
- Economic development [including fisheries] policies.

In addition, cumulative impact assessments undertaken as part of the consenting and EIA processes would also address and mitigate for potential cumulative effects of projects.

14. Monitoring of Residual Effects

The SEA Regulations require that the significant environmental effects of plans and programmes be monitored. This intends to allow the early identification of unforeseen adverse effects so that appropriate remedial action can be taken.

Therefore, monitoring undertaken for the South East Marine Plan as part of the SA, and as part of the implementation and monitoring of the adopted South East Marine Plan, should help to:

- monitor the significant effects of the draft South East Marine Plan
- track whether the South East Marine Plan has had any unforeseen effects
- ensure that action can be taken to reduce / offset the significant negative effects of the plan.

The requirements of the SEA Regulations focus on monitoring the significant and unforeseen effects of the Marine Plan. Therefore, the SA monitoring framework should be focused only on monitoring those effects which are significantly negative or uncertain.

Following the consultation period, the MMO will prepare the final South East Marine Plan and the final SA will be prepared alongside this. Any revisions to the Plan at this stage in response to suggested mitigation or consultee comments will be reviewed and the SA amended accordingly. Following this, the residual significant effects will be identified and a monitoring framework for these effects will be proposed.

The South East Inshore Marine Plan process will itself include a comprehensive monitoring programme which is focused on the achievement of the plan's objectives. This monitoring programme will enable the MMO to track the success of policies and also to monitor the baseline environmental, economic and social conditions of the marine plan area. The monitoring also contributes to the three-yearly reporting to parliament, which in turn provides a mechanism for reviewing and amending the plan or individual policies. The intention is that the SA framework will be linked to this where practical.

15. Next Steps

The SA Report will be consulted on alongside the draft South East Marine Plan during Quarter 1 of 2020.

Comments received on the SA during this period will then be reviewed and amendments made to the next iteration of the SA Report as appropriate. Amendments may also be made to the South East Marine Plan following this consultation period in response to consultation comments received. Should any changes made to the plan be deemed to be significant, the SA will be updated to reflect the amended version of the South East Marine Plan.

The South East Marine Plan and an up to date version of the SA Report will be submitted to the Secretary of State in mid-2020 and the intention is for the Government to adopt the South East Marine Plan in 2021. The adopted South East Marine Plan will be accompanied by an SA Statement as required by the [SEA Regulations](#).
