1: Total out-of-hours contacts:	60,000				

Daily total number of out-of-hours and unscheduled contacts and 7 day average (adjusted for bank holidays).

2: Acute Respiratory Infection daily contacts.

Shown as a percentage of the total contacts with a Read code and as a 7 day average*.

3: Influenza-like illness daily contacts.

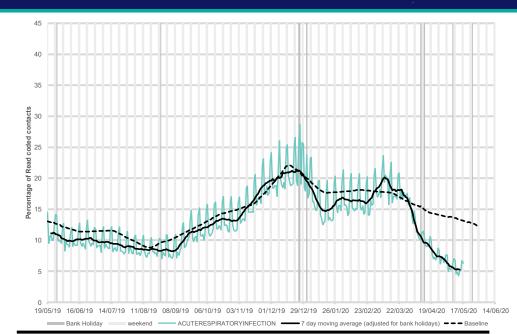

Shown as a percentage of the total contacts with a Read code and as a 7 day average*.

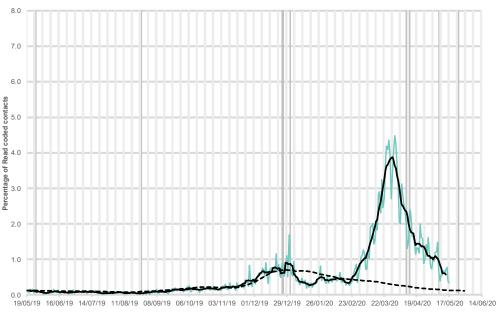

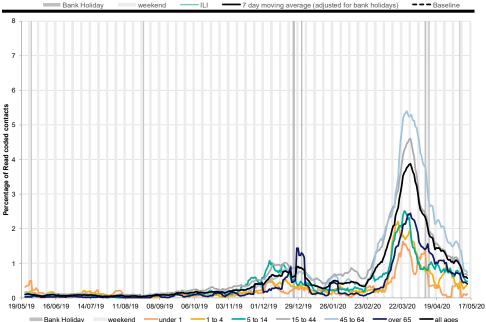

As a percentage of total contacts within each age group, shown as a 7 day moving average adjusted for bank holidays.

Year: 2020 Week: 20

4: Bronchitis/ bronchiolitis daily contacts.

Shown as a percentage of the total contacts with a Read code and as a 7 day average*.

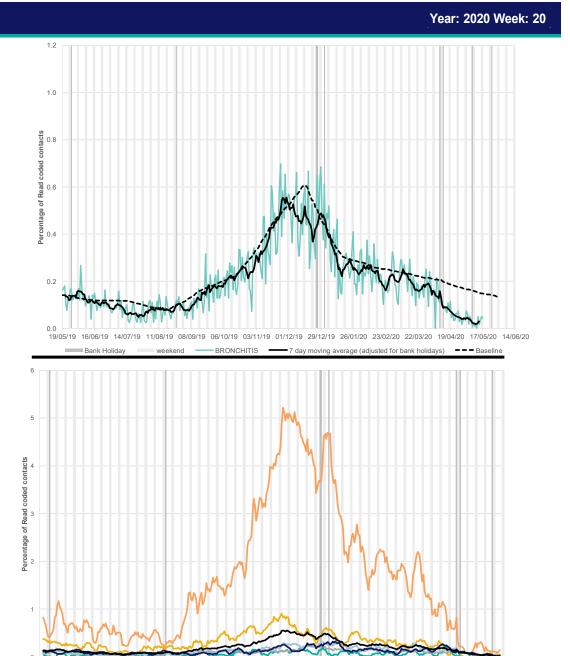

4a: Bronchitis/ bronchiolitis daily contacts by age group*.

As a percentage of total contacts within each age group, shown as a 7 day moving average adjusted for bank holidays.

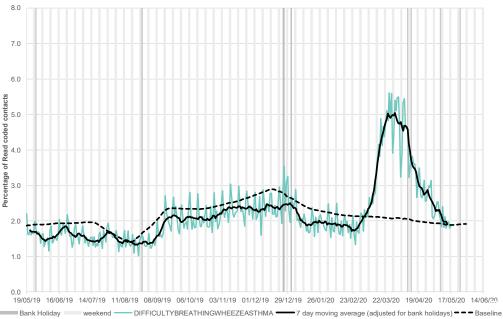

Shown as a percentage of the total contacts with a Read code and as a 7 day average*.

*7-day moving average adjusted for bank holidays.

Notes and caveats:	 This bulletin presents data from the Public Health England (PHE) GP Out -of-hours\Unscheduled Care Surveillance System (GP OOHSS). Fully anonymised data from GP out-of-hours (OOH) and unscheduled care service providers in England are being transferred to the PHE for analysis and interpretation by the PHE Real-time Syndromic Surveillance Team (ReSST). This system supplements existing PHE syndromic surveillance systems by monitoring data on general practitioner consultations outside of routine surgery opening times (evenings, weekends and bank holidays) and unplanned contacts within NHS primary care. The key indicators presented within this bulletin are derived by grouping selected Read coded consultations. GP OOH consultation data are analysed on a daily basis to identify national and regional trends. A statistical algorithm underpins each system, routinely identifying activity that has increased significantly or is statistically significantly high for the time of year. Results from these daily analyses are assessed by the ReSST, along with analysis by age group, and anything deemed of public health importance is alerted by the team. Baselines represent seasonally expected levels of activity and are constructed from historical data since Nov 2009. They take into account any known substantial changes in data collection, population coverage or reporting practices. Gastroenteritis, diarrhoea and vomiting baselines also account for changes since the introduction of rotavirus vaccine in July 2013. Baselines are refreshed using the latest data on a regular basis. 		
Moving Epidemic Method (MEM):	 During winter we present Moving Epidemic Method (MEM) influenza thresholds on selected indicators. The moving epidemic method or MEM is a standard methodology used for setting influenza thresholds across many European nations.¹ MEM is used for GP OOH ILI thresholds at a national level. MEM thresholds should be interpreted using 7 day moving averages rather than daily data. MEM thresholds currently use six years of historic data (2013-2019). The thresholds are re-calculated every year. Baseline ('Pre-epidemic') thresholds are used alongside other surveillance systems to identify the start of influenza circulating in the community 40%, 95% and 97.5% intensity thresholds are used to identify when influenza activity moves from low to medium, high or very high. ¹Vega T et al. Influenza Other Respir Viruses. 2013;7(4):546-58. 		
Further information:	The GP Out-of-Hours Surveillance System Bulletin can also be downloaded from the PHE Real-time Syndromic Surveillance website which also contains more information about syndromic surveillance:
