Environment

Policy groupings:

- Air Quality
- Biodiversity
- Climate Change
- Cumulative Effects
- Disturbance
- Marine Litter
- Marine Protected Areas
- Non Native Invasive Species
- Underwater Noise
- Water Quality

HLMOs addressed by policies:

Living within environmental limits

- Biodiversity is protected, conserved and where appropriate recovered and loss has been halted.
- Healthy marine and coastal habitats occur across their natural range and are able to support strong, biodiverse biological communities and the functioning of healthy, resilient and adaptable marine ecosystems.
- Our oceans support viable populations of representative, rare, vulnerable, and valued species.

Promoting good governance

- The use of the marine environment is spatially planned where appropriate and based on an ecosystems approach which takes account of climate change and recognises the protection and management needs of marine cultural heritage according to its significance

Ensuring a strong, healthy and just society

- The use of the marine environment is benefitting society as a whole, contributing to resilient and cohesive communities that we can adapt to coastal erosion and flood risk, as well as contributing to physical and mental wellbeing
- The marine environment plays an important role in mitigating climate change

See also individual policies linked in templates. This is summarised on the cover page of each group of policies

Policy

SE-AIR-1

Proposals that support a reduction in air pollution will be supported.

Proposals must demonstrate consideration of their contribution to air pollution, both direct and cumulative.

Where proposals are likely to result in or facilitate increased air pollution, proposals should demonstrate that they will, in order of preference:

a) avoid b) minimise c) mitigate air pollution.

What is air pollution?

1. Air pollution is defined as a mixture of gases and particles that have been emitted into the atmosphere by man-made processes. Many substances can [pollute the air](#). Some of these are very harmful and their sale and use is strictly regulated. Others are not immediately harmful, but are released in thousands or millions of tonnes per year nationally as by-products of transport, energy production, chemical manufacture, domestic combustion and farming. When released into the air these substances have gradual but significant impacts on [health](#) and the environment ([Clean Air Strategy 2018](#)).

2. [Air quality](#) is a measure of how polluted the air we breathe is. When air quality is poor, pollutants in the air may be hazardous to people, particularly those with lung or heart conditions.

Where does air pollution occur in the south east marine plan area?

3. Transport is a significant source of emissions of air pollution in the south east ([Clean Air Strategy 2018](#)). To reduce emissions from road transport surcharges have been introduced in central London. From 2019 an Ultra Low Emission Zone will be in place, meaning that most vehicles will need to meet new tighter exhaust emission standards or pay a daily charge to travel within the area.
4. The major contributing industries to air pollution in the south east marine plan area are ports and shipping. The main shipping routes in the south east plan area are on the [Marine Information System](#), see shipping and navigation layer. The English Channel is one of the world's busiest shipping routes.
5. Major ports and their main uses in the south east inshore marine plan area include:
 - Dover - ferry
 - Felixstowe - containers
 - Harwich - ferry
 - Ipswich – ferry, containers and leisure boats
 - London (a number of terminals within the Thames) – cruise liners, ferry and cargo
 - Medway – commercial, ferry
 - Ramsgate – ferry, leisure boats
6. London is ranked as the second busiest port in the UK, Felixstowe is ranked seventh and Dover is ranked eighth busiest port in the UK ([Port freight statistics](#)).
7. Air quality is not routinely monitored at offshore sites, though regular air quality monitoring is carried out by local authorities at coastal areas. Road transport is a significant contribution of emissions to air pollution, so local authorities assess and review air quality in their area. If [national air quality objectives](#) will not be achieved local authorities must declare an [Air Quality Management Area](#) and put together a Local Air Quality Action Plan for the area.
8. Most central London Boroughs have [Air Quality Management Areas](#) in place. Those with the most relevance to ports and shipping in the south east marine plan area include:
 - Tilbury – [Greater London AQMA 24](#) – 1077
 - Westminster – 142
 - City of London – 38
 - Tower Hamlets – 132
 - Barking and Dagenham – 176
 - Havering – 65
 - Bexley – 178
 - Greenwich – 58
 - Lewisham – 79
 - Southwark – 285
 - Lambeth – 596

- Wandsworth – 141
- Thurrock – 788
- Northfleet Industrial area 417
- Thannet – 899
- Dover – [A20 AQMA – 748](#)

9. An Air Quality Management Area that covered Dover Docks was revoked in 2014.
10. The Port of London Authority [Air Quality Strategy](#) states that use of the river Thames annually produces only a small percentage of the London atmospheric emission inventory. The Strategy aims to reduce river-based air pollution on the tidal Thames between Teddington and Southend, whilst facilitating future growth of waterborne freight and passenger transport in line with the aims of Thames Vision. The Department for Transport, Department for Environment, Food and Rural Affairs and the Greater London Authority are all supporting a modal shift from road freight to waterborne transport to help with an overall reduction in carbon emissions.
11. Although shipping is considered one of the most energy efficient modes of transportation it still contributes towards air pollution. As a result of [MARPOL Annex VI](#) a number of Emission Control Areas have been established across the globe with stricter control measures on sulphur and other airborne emissions from ships. The south east inshore marine plan area is covered by the North Sea Sulphur Emission Control Area. Ships entering this area must have a limited sulphur content to their fuel used and must use an approved exhaust cleaning system.

When does air pollution occur in south east marine plan area?

12. Air pollution can generally occur all year round from a number of contributing factors.
13. International and short sea shipping occurs throughout the year in the south east plan areas.

Why is air pollution important to the south east marine plan area?

14. Clean air is a basic requirement of a healthy environment for us all to live in, work, and bring up families. Air quality has improved significantly in recent decades, but there are some parts of our country where there are unacceptable levels of air pollution.
15. The River Thames has always been and remains a vital transport route for essential goods into and from London and the wider south east marine plan area. It is, by far, the busiest inland waterway for the transport of freight in the UK, with over four million tonnes of cargo transported between terminals on the River Thames in 2017, equating to almost 340,000 lorry movements removed from the capital's roads. The use of the river for the movement of freight has been steadily increasing over recent years, with an additional two million tonnes moved annually since 2011. The tidal Thames is also an important artery for the movement of people, with over ten million passengers carried in 2016 ([Air Quality Strategy for the Tidal Thames](#)).
16. In 2017, the [Port of London Authority](#) introduced a discount on port charges for vessels with lower emissions. On the Thames, qualifying vessels have the potential to receive a discount on Thames Vessel Conservancy Charges. The use of the

Green Tariff not only encourages greener ships through a financial incentive, but also provides essential data on emission standards of the vessels.

Other larger ports situated in the south east marine plan area include: Felixstowe, Sheerness, Dover, Ramsgate, Ipswich and Harwich. The [Clean Air Strategy 2018](#) stated that major ports must have air quality strategies. The major ports in the north east inshore marine plan area with air quality strategies are:

- Dover
- Felixstowe
- Harwich
- Ipswich
- [Port of London](#)
- Medway
- Ramsgate

17. Ports should follow the [National Policy Statement for Ports](#) when considering air quality and emissions.

18. Air pollution has direct impacts on the natural environment, contributing to climate change, reducing crop yields and polluting oceans. Cleaner air will directly benefit animals and habitats as well as creating a better environment for everyone to live, work and thrive in ([Clean Air Strategy 2018](#)).

Who is this of interest to?

19. This policy is of interest to all those developing proposals in the south east marine plan area.

20. It is also of interest to public authorities making decisions that affect the south east marine plan area directly or indirectly including local planning authorities and those authorities granting permits or licenses for activity in those areas such as:

- Distribution network operators (UK Power Networks in the south east)
- Port and harbour authorities
- Public authorities with Air Quality Management Areas
- Public authorities with strategic planning functions
- Planning Inspectorate when approving local authority plans

How should this policy be applied?

21. SE-AIR-1 applies to the whole of the south east marine plan area.

22. Decision-makers should support proposals that incorporate measures to reduce air pollution in the south east marine plan area. This may include novel designs, smart technology, proposals or collaboration between developers, public authorities and distribution network operators. Proposals must comply with relevant legislation and other marine plan policies.

23. Proposals should demonstrate that they will, in order of preference, avoid, minimise or mitigate air pollution - proposals cannot proceed to (b) unless they have first demonstrated why they cannot meet (a) etc to achieve this, they should consider best available evidence and guidance to avoid or reduce air pollution. Where the proposal will result in or facilitate increased air pollution, the applicant should

undertake an assessment of the impacts of the proposed project as part of the Environmental Statement.

24. Proposals must demonstrate that they have considered the interaction between sectors, particularly in relation to indirect and cumulative consequences on air pollution, such as:
- port developments to attract more vessels – see all SE-PS policies
 - developments to increase short sea shipping – see SE-PS-4
 - indirectly increasing road or vessel transit
 - greater travelling distances of vessels from placement of new marine infrastructure resulting in increased fuel consumption and in turn air pollution - see SE-CC-1.
25. There is no one solution to reducing air pollution. Mitigation could include but is not limited to, one or a number of the following:
- providing improved grid facilities to support ports developments of shore-side facilities
 - ports encouraging vessels to reduce emissions through incentives
 - transport assessments and vehicle booking systems
 - providing shore-side electrical power to replace ships' generators while in port (cold-ironing)
 - liquefied natural gas (LNG) power barges
 - use renewable energy to charge vessels whilst in port
26. Inclusion of this information does not indicate that approval of the proposal will follow by default. That will also depend on other material considerations to be taken into account by the decision-maker which may include, for example, other plans. If a proposal cannot meet these criteria it will only be authorised if there are relevant considerations in line with the [Marine and Coastal Access Act 2009\(Section 58\(1\)\)](#).
27. When inadequate information has been provided to make an informed assessment, Public authorities should request further information before approving.

Signposting

Policy

SE-BIO-1

Proposals that incorporate features that enhance or facilitate species adaptation or migration, natural native habitat connectivity or net environmental gain will be supported.

Proposals that may have significant adverse impacts on native habitat and species adaptation or connectivity, species migration, or net environmental gain must demonstrate that they will, in order of preference:

- a) avoid
- b) minimise
- c) mitigate significant adverse impacts on species adaptation or migration, native habitat connectivity or net environmental gain.

What is native habitat and species adaptation and connectivity?

1. Native habitats are those which occur within their natural range in line with prevailing physiographic, geographic and climatic conditions. Adaptation is the ability of native habitats, species and populations to respond to changes in the environment. Adaptation includes the natural succession of habitats and range shifts in response to climatic and other environmental changes. The ability of habitats and species to adapt to climate change is also addressed by policies regarding climate change.
2. Species connectivity allows the movement of individuals, juveniles and groups preventing individual or group isolation. Habitat connectivity allows the movement of nutrients and supports species connectivity through the presence of continuous suitable habitat.

What is species migration?

3. Migration is the seasonal movement of populations of animals, for example for breeding or feeding purposes. Migration may occur over a small distance or over a much larger, international, distance. Species can migrate within, to and from the south east marine plan area.

What is net environmental gain?

4. Marine environmental net gain is still an evolving concept. At present there is no working definition and the most applicable definition comes from the [National Planning Policy Framework](#), which extends to mean low water. It describes environmental net gain as contributing to the protection and enhancement of the natural, built and historic environment including making effective use of land, helping to improve biodiversity, using natural resources prudently, minimising waste and pollution, and mitigating and adapting to climate change, including moving to a low

carbon economy. One aim of the [25 Year Environment Plan](#) is to embed an environmental net gain principle for development.

Where are the native habitats and species in the south east marine plan area?

5. The plan area also supports a diverse range of habitats and species, some of which are designated as marine protected areas and some of which lie outside of the marine protected area network. In the south east marine plan area various priority habitats have been identified, such as seagrass beds, subtidal sands and gravels and *Sabellaria spinulosa* reef as shown in figure XXX. Some priority species distribution also extend into the south east plan areas including the native oyster, stalked jellyfish and lagoon sand shrimp as shown in figure XXX. Marine protected areas are a key tool for protecting marine biodiversity in the south east marine plan area and are covered in this plan by policies SE-MPA-1, SE-MPA-2, SE-MPA-3, SE-MPA-4 and SE-MPA-5.
6. See the [Marine Information System](#) for the location or distribution of broadscale habitats and features of conservation importance. Broadscale habitats and features of conservation importance are species and habitats have been identified as threatened, rare or declining. In addition the [Natural Environment and Rural Communities Act \(S41\)](#), requires the Secretary of State to publish a list of habitats and species of principal importance for the conservation of biodiversity in England. The S41 list and features of conservation importance should be used to prioritise habitats and species.

When does migration occur in the south east marine plan area?

7. Native habitats in the south east marine plan area are present all year round and seasonality is restricted to mobile species. The south east marine plan area is important for different reasons at different times of year, for example breeding seabirds in summer, migratory seabirds in winter and seasonal fish spawning and nursery grounds. Grey and harbour seals occur in the Thames Estuary throughout the year.
8. Migratory routes are variable from year to year both temporally and spatially in spite of the destination remaining the same. Birds migrating to the UK for the breeding season typically arrive during spring and leave in autumn, for example common, little and sandwich terns on the Essex coast. Bird species which spend the winter in the UK start arriving in October and leave in March, for example the turnstone on the Thanet coast.

Why are the native habitats and species important to the south east marine plan area?

9. SE-BIO-1 ensures habitats and species have the ability to adapt to future change, and protects migration routes and connectivity between important areas for species. SE-BIO-1 also encourages enhancement of the marine natural environment through net environmental gain.
10. The natural environment and associated species are important intrinsically and because of the wider benefits to society and economy. For example in the south east marine plan area:

- [Seagrass beds](#) such as those along the Leigh-on-Sea coast and in the Medway Estuary, are an important food source for wildfowl such as brent geese, and they reduce coastal erosion as their roots trap sediment
-
- Healthy coastal and marine habitats and populations of charismatic species can support tourism in some areas, for example [Foulness Island](#) in Essex.

11. Competition for space, increased levels of development and predicted effects of climate change can affect the south east marine plan area native habitat and species connectivity, their ability to adapt to change, and species migration routes.
12. The ability of habitats to respond to and adapt to climatic and other environmental changes ensures resilience in the natural environment. Particular species may also need to adapt to changes in their habitats, predation or competition. The ability of habitats and species to adapt to change is important for biodiversity both within and outside of marine protected areas.
13. Migratory routes are essential to the success of key life stages of migratory species, such as breeding. Disruption to migratory pathways can negatively affect the success of a population, potentially threatening long term viability. The [European eel](#) is an important migratory species in the Thames, [Adult eels migrate](#) from their freshwater habitats in autumn, predominantly from October to December and juvenile eels appear throughout the summer moving from salt to fresh water. Migratory birds are important in the south east marine plan area, for example for example common, little and sandwich terns arriving to breed in spring on the Essex coast and the turnstone overwintering on the Thanet coast.
14. Connectivity between species, habitats and populations (both within and outside of the south east marine plan area) is important for maintaining genetic diversity and allowing species to undergo seasonal breeding and foraging migrations. Habitat fragmentation and loss as a result of development often has a negative impact such as on population numbers or on the movement of individuals between increasingly isolated populations. This threatens species long term viability.
15. Habitat and species connectivity is particularly relevant for the south east marine plan area where there are rich marine habitats which support fish, marine mammals and bird species. Busy ports and offshore renewable energy development in the area along with the predicted effects of climate change could potentially lead to habitat fragmentation.
16. Ensuring the connectivity of habitats and species within and outside of the south east marine plan area is also important as it contributes to the maintenance and cohesion of the existing marine protected area network and surrounding seas.
17. Achieving net environmental gain is important for the south east marine plan area to support resilient ecosystems which can facilitate native habitat and species adaptation and connectivity and species migration, aiding the maintenance of healthy habitats and populations. There are examples of habitat restoration projects in the south east marine plan area, such as the [Jubilee Marsh \(Wallasea\)](#) project, which follow the principles of environmental net gain,

18. SE-BIO-1 contributes to multiple UK policy areas and initiatives. The Marine Strategy Regulations 2010 are part of a set of policies to help the UK meet our aim to achieve clean, healthy, safe, productive and biologically diverse oceans and seas. The directive describes good environmental status in 11 main points which cover all of the important aspects of the marine ecosystem and all of the main human pressures on them. From this a programme of measures for achieving good environmental status was developed in three parts.
19. Marine planning was recognised in the [Marine Strategy Part Three: UK Programme of Measures as a measure of addressing habitat and species features specifically through descriptors 1, 4, 6 and 7.](#)
20. Through encouraging net environmental gain this policy supports the [25 year Environment Plan](#) aim to protect and grow natural capital and support environmental enhancement. This policy contributes to the sustainable development aims in the [National Planning Policy Framework](#), including: meeting the challenge of climate change, flooding and coastal change; conserving and enhancing the natural environment; and facilitating the use of sustainable materials.

Who is this of interest to?

21. Developers when preparing proposals which may interact with native habitats and species in the south east marine plan area.
22. Decision-making public authorities including:
- Local planning authorities
 - Marine licensing authorities
 - The Planning Inspectorate
 - The Crown Estate
 - Inshore Fisheries and Conservation Authorities
 - Department of Business, Energy and Industrial Strategy
 - Maritime and Coastguard Agency
 - Port and Harbour Authorities
23. Advisory public authorities including:
- Centre for Environment, Fisheries and Aquaculture Science
 - Joint Nature Conservation Committee
 - Natural England

How should this policy be applied?

24. Decision-makers will support proposals that result in net environmental gain, incorporate measures that enhance or facilitate native habitat and species connectivity, adaptation and migration, enabling the environment to respond to climate change and development. This may include novel designs, and collaboration between developers and public authorities. Proposals must comply with relevant legislation and other marine plan policies.
25. SE-BIO-1 requires proposals to avoid negative effects which may not enable the functioning of healthy, resilient and adaptable marine and coastal ecosystems.

26. Public authorities should apply these policies proportionally on proposals that will interact with native habitat and species adaptation or connectivity, species migration or net environmental gain. Determination may be informed by a relevant assessment. An assessment to determine how a proposal can be beneficial to habitat and species adaptation, migration and connectivity should:
- ensure understanding of habitat types within and adjacent to the area of proposal
 - ensure understanding of importance of these habitats to species – important species are migratory, breeding or roosting birds, spawning and migratory fish, and mobile species such as marine mammals
 - consider the ability for habitats to naturally migrate with changing climate and/or if the proposal could assist habitat and species migration
27. Proposals should incorporate measures that enhance or facilitate native habitat and species adaptation and connectivity, species migration and net environmental gain within the south east marine plan area. Enhancement refers to measures taken which have a positive impact, for example coastal protection works that enhance fish habitat by creating additional saltmarsh. Where artificial structures are used to recreate habitat, these proposals must be in line with policy. Where positive impacts have been identified, proposals must also assess adverse impacts in line with relevant legislation. Enhancement is not a substitute for avoidance, minimisation or mitigation measures.
28. Proposals must demonstrate that they will, in order of preference, avoid, minimise or mitigate any significant adverse impacts on native habitat and species adaptation or connectivity, species migration or net environmental gain within the south east marine plan area - proposals cannot proceed to (b) unless they have first demonstrated why they cannot meet (a) etc. Measures could include:
- avoid - siting developments in a location which does not fragment habitats or create a barrier to habitat adaptation, seasonal migrations or species movements
 - minimise - avoiding operational work during seasonal migrations or the use of temporary or floating structures
 - mitigate - the use of soft infrastructure solutions, novel infrastructure design that allows for juvenile fish shelters and corridors for movement
29. Proposals are still required to be in compliance with relevant legislation and regulations including Conservation of Habitats and Species Regulations 2017, Conservation of Offshore Marine Habitats and Species Regulations 2017, Marine and Coastal Access Act, Environmental Impact Assessment also other national legislation such as The Eels (England and Wales) Regulations 2009, Salmon and Fresh Water Fisheries Act 1975 and National Policy Statements where they apply.
30. It is essential to identify potential for net environmental gain and the location of features and sites within the south east marine plan area that are important for enabling native habitats to adapt and connect and species to adapt, connect and migrate as well as those important for wider biodiversity, including beyond marine protected areas.

31. Proposals must consider the available evidence and identify any significant adverse impacts on native habitat and species adaptation or connectivity, species migration or net environmental gain.
32. Inclusion of this information does not indicate that approval of the proposal will follow by default. That will also depend on other material considerations to be taken into account by the decision-maker which may include, for example, other plans.
33. Proposals having a significant adverse impact on native habitat and species adaptation or connectivity, species migration or net environmental gain must include evidence illustrating consideration of avoiding, minimising or mitigating impacts. This evidence will enable public authorities to make an informed assessment as to whether or not the proposal meets the policies. Evidence to demonstrate consideration could be drawn from sources including the South East Marine Plan and the Marine Information System.
34. It is important to note that where evidence is not available there may still be habitats and species that are sensitive or of conservation concern. Proposals may require additional and more specific evidence.
35. Where new evidence emerges that improves or changes the evidence provided here, this must be used in applying these policies. Both public authorities and proposals should consider this along with any other evidence gathered.

Policy

SE-BIO-3

Proposals that enhance coastal habitats where important in their own right and/or for ecosystem functioning and provision of ecosystem services will be supported.

Proposals must take account of the space required for coastal habitats where important in their own right and/or for ecosystem functioning and provision of ecosystem services and demonstrate that they will, in order of preference:

- a) avoid
- b) minimise
- c) mitigate for net loss of coastal habitat.

What are coastal habitats and ecosystems?

1. Habitat is defined as the physical surroundings in which organisms live and interact. Coastal habitats occur where land meets sea. Coastal habitats in the south east marine plan area include but are not limited to vegetated shingle, maritime cliffs and slopes, saltmarsh, sand dunes, sandflats, mudflats, seagrass beds, intertidal rocky reefs and intertidal sea caves. An ecosystem is the dynamic complex of plant and animal communities and the surrounding non-living environment that supports them in the south east marine plan area.

What is ecosystem functioning?

2. The functionality of an ecosystem depends on the relationship within, among and between species and the non-living environment as well as the physical and

chemical interactions within the environment. Effective ecosystem function is reliant upon solar energy flow, for example photosynthesis by phytoplankton, mineral and nutrient cycling such as the absorption of carbon dioxide from the atmosphere such as by saltmarsh, and water cycling.

What are ecosystem services?

3. Ecosystem services are the benefits people obtain from the natural environment. The classification of ecosystem services adopted by the [UK National Ecosystem Approach](#) categorises services as follows: regulating, provisioning, cultural and supporting services.
 - regulating services such as flood defence and carbon sequestration services (the process of capturing carbon dioxide from the environment) for example sand dunes which act as natural flood defence
 - provisioning services comprise products obtained from the environment such as food and resources, for example fish stocks targeted by fisheries
 - cultural services are non-physical and connected to human behaviours and values, for example aesthetic values, cultural heritage values and tourism
 - supporting services are necessary for the function of all other ecosystem services. Impacts on humans from supporting services are likely to be indirect or occur over a long period of time. Examples include oxygen production through photosynthesis, soil formation and retention and habitat provision
4. Habitats such as saltmarshes, sand dunes, seagrass beds and mudflats provide a variety of ecosystem services. Saltmarshes and mudflats play an important natural role in protecting the coast from flood events, by reducing wave energy and buffering flood waters. Well-developed sand dune systems act to stabilise sediments, therefore reducing coastal erosion.
5. Saltmarshes and seagrass beds also provide a natural carbon sequestration service. Saltmarsh habitat is one of the most productive ecosystems in the world and as such can sequester a large amount of carbon. Importantly, due to the anoxic (without oxygen) nature of the habitat, the carbon is often shifted from the short term to the long term carbon cycle. This capability is a valuable asset of many of the world's ecosystems.

Where are coastal habitats in the south east marine plan area?

6. Figure xxx shows the distribution of coastal habitats in the south east marine plan area. In addition up-to-date maps of designated coastal sites and marine protected areas are available on the [Marine Information System](#). The [Natural Environment and Rural Communities Act \(S41\)](#), requires the Secretary of State to publish a list of habitats and species of principal importance for the conservation of biodiversity in England. The S41 list and features of conservation importance should be used to prioritise habitats that this policy applies to.

When are coastal habitats present in the south east marine plan area?

7. Coastal habitats are present all year round in the south east plan area and continuously support ecosystem functioning and the provision of ecosystem services.

Why are coastal habitats important to the south east marine plan area?

8. The south east marine plan area comprises a busy environment, incorporating the tidal Thames as far inland as Teddington. Coastal habitats including but not limited to estuaries, mudflats, sand flats, reefs and sea caves occur in the south east marine plan area.
9. The southern extent of the south east marine plan area is characterised by white, high chalk cliffs on the south coast at Dover with lower chalk cliffs on the east coast at Thanet. The river Stour estuary in Kent forms a bay of intertidal mud and sand flats. To the south there are sand dunes and shingle beaches as well as freshwater marshes. Chalk cliffs continue on the north Kent coast in associated with distinctive sea stacks and arches. The north Kent coast also leads into extensive estuarine shores and tidal flats. Coastal wet grasslands and saltmarshes are important for waterfowl and wading bird species and mudflats provide a haul out site for grey and harbour seals.
10. The Medway and Swale estuaries are associated with extensive areas of coastal saltmarsh, intertidal saltmarsh, seagrass beds, saline lagoons and peat and clay exposures. The [Swale Estuary](#) is of notable importance as a spawning and nursery ground for several fish species.
11. The Thames estuary is bordered by low lying mudflats, shallow muddy creeks and tidal salt marsh. The tidal Thames is a developed region with built up areas extending along much of the riverside. [Seals and cetaceans](#) (primarily harbour porpoises) have been sighted along much of the Thames and it is also an important habitat for protected species such as the [tentacled lagoon-worm](#).
12. To the north of the Thames estuary, on the Essex coast, there is an intricate network of estuaries, rivers, tributaries, shallow creeks and extensive areas of mudflats and tidal saltmarshes. These habitats support numerous breeding and overwintering bird populations.
13. Saltmarshes and seagrass beds provide important regulatory ecosystem services through carbon sequestration and habitat stabilisation. Mudflats, sand flats and sand dunes also provide regulatory ecosystem services in the form of natural flood defences as they reduce wave energy and buffer flood waters. Spawning and nursery grounds are important supporting services as they are necessary for the function of the ecosystem, including supporting provisioning services such as fish populations targeted by fisheries.
14. The south east marine plan area supports internationally significant populations of breeding and overwintering seabirds, wading birds and waterfowl. These, in addition to the recreation associated with the coast for example the beaches (some of which are detailed [here](#)), angling and canoeing, make cultural ecosystem services a draw to the south east marine plan area.
15. Coastal habitats are vulnerable to human pressures including climate change. The Joint Nature Conservation Committee has developed a [database](#) which aims to understand the relationship between human activities and their associated pressures on the marine and coastal environment. [Pressures](#) associated with coastal

ecosystems include but are not limited to permanent or temporary physical loss or change in habitat.

16. The change or loss of coastal habitats can impact the function of the local ecosystem and the provision of ecosystem services. Dunes, sandflats and mudflats offer natural coastal protection throughout the south east marine plan area whilst saltmarsh habitat absorbs carbon from the atmosphere. The rich diversity of wildlife and natural beauty of marine protected areas in the south east marine plan area offer inspiring places to live, work and visit. The [Joint Nature Conservation Committee](#) has explored the components and processes associated with marine and coastal ecosystem services.
17. Much of the south east marine plan area is densely populated, particularly on the tidal Thames. The coastal environment in much of the south east marine plan area has already been altered extensively, for example the [Thames Barrier](#) in the Thames estuary, reclaimed marshland for agriculture in Essex and areas dredged for shipping. However, there are already examples of coastal habitat enhancement in the south east marine plan area, primarily the [Wallasea Island Coast Project](#). The project is a wetland restoration project restoring the area to a [mosaic of mudflat marshes and lagoons](#). This enhanced habitat comprises important flood defence in the region, supports a diverse range of species and is an attraction for visitors.
18. Functional coastal ecosystems in the south east marine plan area play a significant role in achieving the UK government's vision clean, healthy, safe, productive and biologically diverse oceans and seas. Coastal habitats comprise part of the [UK programme of measures](#) to achieve 'Good Environmental Status' in UK waters under the [Marine Strategy Regulations 2010](#). The main descriptor of 'Good Environmental Status' for coastal habitats is Descriptor one: 'Biological diversity is maintained. The quality and occurrence of habitats and the distribution and abundance of species are in line with prevailing physiographic, geographic and climatic conditions'. These commitments are reinforced through the in the [UK Marine Policy Statement](#) through a commitment to healthy marine and coastal habitats. Functional coastal ecosystems also contribute to the [UK Marine Policy Statement](#) objective, 'healthy marine and coastal habitats occur across their natural range and are able to support strong, biodiverse biological communities and the functioning of healthy, resilient and adaptable marine ecosystems'.
19. The [National Planning Policy Framework](#) includes commitments to 'reduce risk from coastal change by avoiding inappropriate development in vulnerable areas and not exacerbating the impacts of physical changes to the coast' (para. 167). The [25 year Environment Plan](#) from the Department for Environment, Food and Rural Affairs commits to reducing risks from flooding and coastal erosion and promotes environmental enhancement. This commitment is also supported by the [National flood and coastal erosion risk management strategy for England](#).

Who is this of interest to?

20. This policy applies to any organisation or individual putting forward a proposal including, but not restricted to, those applying for an authorisation. A proposal can be for a new activity or a change to an existing activity that is subject to management by public authorities.

21. Public authorities must take any authorisation or enforcement decisions in accordance with this policy. Authorisation and enforcement decisions are defined under Section 58(4) of the [Marine and Coastal Access Act 2009](#).

How should this policy be applied?

22. This policy applies to coastal habitats throughout the south east marine plan area.

23. Public authorities will support proposals that enhance coastal habitats in their own right and / or for ecosystem functioning and provision of ecosystem services where it complies with other policies in this plan and other relevant legislation.

24. Public authorities will assess if the proposal affects coastal habitats in their own right and / or ecosystem functioning and provision of ecosystem services on a case-by case basis. Public authorities should apply these policies proportionally on proposals that will interact with coastal habitats in their own right and / or ecosystem functioning and provision of ecosystem services. Determination may be informed by a relevant assessment. An assessment to determine how a proposal can be beneficial to coastal habitats should:

- ensure understanding of habitat types within and adjacent to the area of proposal
- ensure understanding of importance of these habitats to ecosystem functioning and ecosystem services
- consider the space required for effective function of coastal habitats and/or if the proposal could assist coastal habitat enhancement

25. Proposals that enhance coastal habitats should include information demonstrating how this will be achieved. Enhancement refers to measures taken which have a positive impact, for example coastal protection works that enhance fish habitat by creating additional saltmarsh. Where artificial structures are used to recreate habitat, these proposals must be in line with policy, for example SE-NIS-1, SE-NIS-2 and SE-NIS-3. Where positive impacts have been identified, proposals must also assess adverse impacts in line with relevant legislation. Enhancement is not a substitute for avoidance, minimisation or mitigation measures.

26. Proposals must consider the available evidence and identify any significant adverse impacts on coastal habitats. Proposals must demonstrate that they will, in order of preference, avoid, minimise or mitigate the net loss of coastal habitats within the south east plan area – proposals cannot proceed to (b) unless they have first demonstrated why they cannot meet (a) and so on. Inclusion of this information does not indicate that approval of the proposal will follow by default. Approval will also depend on other material considerations taken into account by the decision-maker which may include, for example, other plans.

27. Proposals must still comply with requirements under relevant legislation including the [Conservation of Habitats and Species Regulations 2017](#), the [Marine and Coastal Access Act 2009](#), the [Wildlife and Countryside Act 1981](#), the [Countryside and Rights of Way Act 2000](#), the [Town and Country Planning \(Environmental Impact Assessment\) Regulations 2017](#), and other national legislation.

28. It is important to note that where evidence is not available there may still be habitats and species that are sensitive or of conservation concern. Proposals may require additional and more specific evidence.

29. Where new evidence emerges that improves or changes the evidence provided here, this must be used in applying these policies. Both public authorities and proposals should consider this along with any other evidence gathered.

Policy

SE-BIO-04

Proposals that enhance the distribution and net extent of priority habitats and distribution of priority species in the south east marine plan area will be supported. Proposals must avoid reducing the distribution and net extent of priority habitats and other habitats priority species rely on.

What are priority habitats and species?

1. Priority habitats and species are those recognised as being of 'principal importance' for the conservation of biological diversity in England under the [Natural Environment and Rural Communities Act \(2006\) Section 41](#). Priority habitats comprise coastal and offshore habitats including but not limited to intertidal mudflats, subtidal sands and gravels, *Sabellaria* reefs, sea grass beds and sheltered muddy gravels. Priority species include but are not limited to herring gull, common maerl, *Arctica islandica*, native oyster and stalked jellyfish.
2. Priority habitats and species have been identified through additional organisations and legislation. Features of Conservation Importance, including marine habitats, are identified by the Joint Nature Conservation Committee and listed in the [Ecological Network Guidance](#). The Conservation of Habitats and Species Regulations and the Conservation of Offshore Marine Habitats and Species Regulations require protection for [Annex 1 habitats and Annex II species](#). The [Convention for the Protection of the North-East Atlantic](#) has developed a [list of threatened and / or declining species and habitats](#).

What is Enhancement?

3. Enhancement refers to measures taken which have a positive impact, for example the creation of saltmarsh habitat as part of a coastal realignment scheme which can provide natural flood and erosion defence while acting as important habitat for wading birds. Environmental enhancement aims to improve the condition of natural capital assets, a knock on effect of which is increased value to people through the benefits of the ecosystem services provided by that asset.

Where are priority habitats and species in the south east marine plan area?

4. Maps of the known distribution of priority habitats and species are available on [Marine Information Systems](#).

5. The south east inshore marine plan area has a wide range of coastal habitats, varying in abundance, extent and condition. There are significant areas of saltmarsh, seagrass beds and mudflats for example in the Medway Estuary. There are large expanses of subtidal sands and muds in the deeper regions of the south east marine plan area.
6. Native oysters an important priority species in the south east marine plan area, for example in estuaries along the Essex coast. Starlet sea anemones and tentacle lagoon worms are known to occur in the Stour estuary in Essex. [Harbours seals](#) are distributed in the Thames estuary and around the Kent and Essex coasts, venturing into deeper waters beyond the coast to feed.

When is this policy relevant in the south east marine plan area?

7. Priority habitats are present in the south east marine plan area all year round. The seasonal and temporal variations which exist are species and project dependent and individual projects will need to consider these temporal aspects of priority species. Decision-makers will need to apply the best available evidence and the precautionary principle on a case-by-case basis.

Why are priority habitats and species important to the south east marine plan area?

8. Priority species are important in their own right for their contribution to biodiversity and can encourage eco-tourism which brings economic prosperity to the south east region.
9. The European eel is a priority species and has important local value in the south east marine plan area, commercially and in conservation. Harbour seals are a large, charismatic marine species which are distributed throughout the south east marine plan area, including in the Thames Estuary, Native oysters, lagoon sea slugs and tentacled lagoon worms are also priority species which occur in the south east marine plan area, particularly in estuaries along the Essex coast.
10. Subtidal sands and gravels are a priority habitat which occurs throughout much of the south east marine plan area, particularly in the Thames estuary and approaches. Intertidal mudflats occur, primarily in estuaries for example in the Medway estuary. Seagrass beds also occur in the Medway and on the Essex coast, for example at Southend on Sea. There are also reef habitats, such as Sabellaria spinulosa reef off the coast of West Mersea.
11. Not all priority habitats and species occur within designated sites. Some habitats and species that are recognised as internationally important are not always present to an internationally significant extent in the south east marine plan area and are therefore not designated. These habitats and species may still be important at a local level but receive less protection compared to designated features. They are protected under the [Conservation of Habitats and Species Regulations 2017 \(for inshore areas\)](#) and for offshore areas, the [Conservation of Offshore Marine Habitats and Species Regulations 2017](#). This policy also protects non-designated habitats that are important for protected species.

12. The [UK Marine Policy Statement](#) states that marine plans will contribute to the achievement of the UK's high level marine objectives, which includes the following: 'Healthy marine and coastal habitats occur across their natural range and are able to support strong, biodiverse biological communities and the functioning of healthy, resilient and adaptable marine ecosystems' (Marine Policy Statement box 1).
13. SE-BIO-4 contributes to multiple UK policy areas and initiatives. The Marine Strategy Regulations 2010 are part of a set of policies to help the UK meet our aim to achieve clean, healthy, safe, productive and biologically diverse oceans and seas. The directive describes good environmental status in 11 main points which cover all of the important aspects of the marine ecosystem and all of the main human pressures on them. From this a programme of measures for achieving good environmental status was developed in three parts. Marine planning was recognised in the [Marine Strategy Part Three: UK Programme of Measures](#) as a measure of addressing habitat and species features specifically through descriptors 1, 4, 6 and 7.
14. Through encouraging environmental enhancement this policy supports the [25 year Environment Plan](#) aim to protect and grow natural capital and support environmental net gain. This policy contributes to the sustainable development aims in the [National Planning Policy Framework](#) meeting the challenge of climate change, flooding and coastal change and conserving and enhancing the natural environment.

Who is this of interest to?

15. This policy applies to any organisation or individual putting forward a proposal including, but not restricted to, those applying for an authorisation. A proposal can be for a new activity or a change to an existing activity that is subject to management by public authorities.
16. Public authorities must take any authorisation or enforcement decisions in accordance with this policy. Authorisation and enforcement decisions are defined under Section 58(4) of the [Marine and Coastal Access Act 2009](#).
17. Public authorities must also have regard to this policy when exercising any function capable of affecting the south east marine plan area, but which are separate from authorisation and enforcement decisions (Section 58(3) of the [Marine and Coastal Access Act 2009](#)). Such functions include but are not limited to:
 - strategic planning
 - land and water management
 - waste management
 - access management
 - flood and erosion risk management
 - fisheries management
18. Advisory public authorities including:
 - Centre for Environment, Fisheries and Aquaculture Science
 - Joint Nature Conservation Committee
 - Natural England
 - Environment Agency

How should this policy be applied?

19. This policy applies to priority habitats and species, and habitats relied upon by priority species throughout the south east marine plan area.
20. Public authorities will support proposals that enhance the distribution and net extent of priority habitats and species in the south east marine plan area where it complies with other policies in this plan and relevant legislation.
21. Proposals that enhance the distribution and net extent of priority habitats and distribution of priority species should include information demonstrating how this will be achieved. Enhancement refers to measures taken which have a positive impact. An example of enhancement could include the removal of hard coastal defence structures in favour of soft engineering which enables habitat roll back.
22. All current available evidence relating to priority habitats, priority species and habitats relied upon by priority species must be taken into account for proposals in the south east marine plan area.
23. Data and evidence on the location, distribution and extent of priority habitats and species throughout the south east marine plan area is still developing. The absence of evidence does not mean that there are no habitats or species that are sensitive or of conservation concern. Additional proposal-specific evidence may be required. It is essential for proposals to identify the location of priority habitats within the south east marine plan area that may be affected by the proposal. Where new evidence emerges that improves or changes the evidence provided here, this must be taken account of in applying the policy. Public authorities and proposals should consider this along with any other evidence gathered. SE-BIO-4 relates to all priority habitats and species (including habitat relied upon by priority species) in the south east marine plan area.
24. Where positive impacts have been identified, proposals must also assess adverse impacts in line with relevant legislation. Enhancement is not a substitute for avoidance, minimisation or mitigation measures.
25. Proposals must still comply with requirements under relevant legislation including the [Conservation of Habitats and Species Regulations 2017](#), the [Conservation of Offshore Marine Habitats and Species Regulations 2017](#), the [Marine and Coastal Access Act 2009](#), the [Wildlife and Countryside Act 1981](#), the [Countryside and Rights of Way Act 2000](#) and the [Town and Country Planning \(Environmental Impact Assessment\) Regulations 2017](#), and other national legislation.
26. Proposals must demonstrate that they avoid reductions in the distribution and net extent of priority habitats within the south east marine plan area. This can be shown through the proposal demonstrating consideration of its location, for example, or of the location of any infrastructure and the effect of any change to habitats or species during construction or operation of the project.

27. Inclusion of this information does not indicate that approval of the proposal will follow by default. That will also depend on other material considerations to be taken into account by the decision-maker which may include, for example, other plans. Public authorities should implement this policy proportionally on proposals that may reduce priority habitat and species distribution and extent.

Policy drafting template SE-BIO-5

HLMO	Living within environmental limits	Sub bullet(s)	Our oceans support viable populations of representative, rare, vulnerable, and valued species. Healthy marine and coastal habitats occur across their natural range and are able to support strong, biodiverse biological communities and the functioning of healthy, resilient and adaptable marine ecosystems. Biodiversity is protected, conserved and where appropriate recovered and loss has been halted.
Grouping	Ecosystem approach	Code	SE-BIO-5

Policy

SE-BIO-5

Proposals must demonstrate that they will in order of preference:

- a) avoid
 - b) minimise
 - c) mitigate significant adverse effects on marine or coastal natural capital assets, or
 - d) if it is not possible to mitigate significant adverse effects on marine or coastal natural capital assets proposals should state the case for proceeding.
- Proposals should seek to enhance marine or coastal natural capital assets where possible.

What is a marine natural capital asset?

1. In general, natural capital is the sum of our ecosystems, species, freshwater, land, soils, minerals, our air and our seas. [Natural assets](#) include soil, water, air and all living things and can be referred to as '[stocks](#)'. These are all elements of nature that either directly or indirectly bring value to people and the country at large. They do this in many ways chiefly by providing us with food, clean air and water, wildlife, energy, wood, recreation and protection from hazards.
2. Natural capital is an emerging concept. The approach to defining, identifying and considering marine natural capital assets in decision-making is in development with the current focus on building a common and shared knowledge base to enable understanding of [marine environments in the context of natural capital assets](#). Until the marine natural capital approach is agreed, the more established ecosystem services approach should be considered when applying this policy.

3. The concept of natural capital builds on the [Ecosystem Approach](#) and [Ecosystem Services Approach](#), which are important elements of sustainable development. Ecosystem services are the benefits people obtain from the natural environment. The classification of ecosystem services adopted by the [UK National Ecosystem Approach](#) categorises services as follows: regulating, provisioning cultural and supporting services.
- regulating services such as flood defence and carbon sequestration services (the process of capturing carbon dioxide from the environment), for example sand dunes which act as natural flood defences
 - provisioning services comprise products obtained from the environment such as food and resources, for example fish stocks targeted by fisheries
 - cultural services are non-physical and connected to human behaviours and values, for example aesthetic values, cultural heritage values and tourism
 - supporting services are necessary for the function of all other ecosystem services. Impacts on humans from supporting services are likely to be indirect or occur over a long period of time. Examples include oxygen production through photosynthesis, soil formation and retention and habitat provision

What is enhancement?

4. Enhancement refers to measures taken which have a positive impact, for example the creation of saltmarsh habitat as part of a coastal realignment scheme which can provide natural flood and erosion defence while acting as important habitat for wading birds. Environmental enhancement aims to improve the condition of natural capital assets, a knock on effect of which is increased value to people through the benefits of the ecosystem services provided by that asset.

Where are marine natural capital assets in the south east marine plan area?

5. Approaches to identify marine natural capital assets is in development. The ecosystem services present in the south east marine plan area include but are not limited to:
- seagrass beds, such as those along the Southend on Sea coast for example, comprise important nursery habitats for fish species and comprise a buffer to the coast, reducing coastal erosion
 - fish spawning and nursery grounds support fish stocks in the area contributing to the provision of food
 - cultural value in terms of the coastal environment, supporting tourism and cultural heritage
6. The known distribution and location of the habitats can be found in [Marine Information Systems](#).

When are marine natural capital assets present in the south east marine plan area?

7. Ecosystem services, and therefore natural capital, are functional throughout the year. Natural capital associated with recreation the peak is during the spring and summer months when tourism and recreational activities are greatest.

Why are marine natural capital assets important to the south east marine plan area?

8. The importance of natural capital assets in the south east marine plan area is already apparent the [Wallasea Island Coast Project](#) for example. The project is a wetland restoration project restoring the area to a [mosaic of mudflat marshes and lagoons](#). This enhanced habitat comprises important flood defence in the region, supports a diverse range of species and is an attraction for visitors.
9. Habitats such as saltmarshes, seagrass beds and mudflats provide a variety of ecosystem services. Saltmarshes, such as those found in the Medway estuary, provide a natural carbon sequestration service. Saltmarsh habitat is one of the most productive ecosystems in the world and as such can sequester a large amount of carbon. Importantly, due to a lack of oxygen in saltmarsh habitats, the carbon is often shifted from the short term to the long term carbon cycle. When carbon transitions to the long term carbon cycle it takes much longer to be released back into the atmosphere as carbon dioxide, thus contributing to the reduction of carbon emissions. This capability is a valuable asset of many of the world's ecosystems. Areas of saltmarsh habitat in the south east marine plan area include but are not limited to the Medway estuary and along the Essex coast.
10. Seagrass beds, for example as found in the Medway estuary and along the coast of Southend on Sea, are considered to be an important carbon sink and sediment stabilising habitat within the marine environment. Mudflats, also a feature of the Medway estuary, play an important natural role in protecting the coast from flood events by reducing wave energy and buffering flood waters.
11. Marine species such as fish and shellfish are an important component of provisioning services. In the south east marine plan area commercially [targeted species](#) include but are not limited to cockle, lobster, mackerel and cod. Cultural services in the south east marine plan area contribute to health and wellbeing, for example the range of coastal sites on the [Essex coastline](#) which encourage people to spend time outdoors.
12. Supporting services underpin all of the other services and occur throughout the south east marine plan area, these services include primary production by phytoplankton, seagrasses and seaweeds and nutrient cycling aided by burrowing worms in seabed sediments. [Biodiversity](#) is an important component of healthy and resilient ecosystems and is considered fundamental to the success of enhancing natural capital assets.
13. Policy SE-BIO-5 will also aid the achievement of Good Environmental Status for Descriptor 1, 'Biological diversity is maintained. The quality and occurrence of habitats and the distribution and abundance of species are in line with prevailing physiographic, geographic and climatic conditions' as detailed in the [Marine Strategy Part Three: UK Programme of Measures](#).
14. Policy SE-BIO-5 also contributes to the UK high level marine objectives for living within environmental limits and supports the [25 Year Environment Plan](#) aim to protect and grow natural capital and support environmental enhancement. This policy contributes to the sustainable development aims in the [National Planning Policy Framework](#).

Who is this of interest to?

15. This policy applies to any organisation or individual putting forward a proposal including, but not restricted to, those applying for an authorisation. A proposal can be for a new activity or a change to an existing activity that is subject to management by public authorities.
16. Public authorities must take any authorisation or enforcement decisions in accordance with this policy. Authorisation and enforcement decisions are defined under Section 58(4) of the [Marine and Coastal Access Act 2009](#).
17. Public authorities must also have regard to this policy when exercising any function capable of affecting the south east marine plan area, but which are separate from authorisation and enforcement decisions (Section 58(3) of the [Marine and Coastal Access Act 2009](#)). Such functions include but are not limited to:
 - strategic planning
 - land and water management
 - waste management
 - access management
 - flood and erosion risk management
 - fisheries management

How should this policy be applied?

18. This policy applies to the inshore and offshore marine plan area.
19. Public authorities should support proposals which enhance marine natural capital assets within the south east marine plan area where they comply with other policies in this plan and relevant legislation.
20. Public authorities will assess if the proposal affects marine natural capital assets on a case-by-case basis. Decision-makers should seek advice on how to consider marine natural capital assets from the statutory nature conservation bodies. Where advice states that it is not possible to assess the impact there will be no further requirements for decision-makers to consider marine natural capital assets beyond that which is required by the ecosystem services approach. The requirements on how to consider marine natural capital assets under policy SE-BIO-5 may change if guidance is issued. New and evolving advice will not be applied retrospectively to activities that have already been consented.
21. Proposals that enhance marine natural capital assets should include information demonstrating how this will be achieved. Where positive impacts are identified, proposals must also assess adverse impacts in line with relevant legislation. Enhancement is not a substitute for avoidance, protection or mitigation measures.
22. Proposals must still comply with requirements under relevant legislation including the [Conservation of Habitats and Species Regulations 2017](#), the [Conservation of Offshore Marine Habitats and Species Regulations 2017](#), the [Marine and Coastal Access Act 2009](#), the [Wildlife and Countryside Act 1981](#), the [Countryside and Rights](#)

[of Way Act 2000](#), the [Town and Country Planning \(Environmental Impact Assessment\) Regulations 2017](#), and other national legislation.

23. Proposals that have significant adverse impacts on marine natural capital assets must demonstrate that they will, in order of preference, avoid, minimise or mitigate any significant adverse impacts on marine natural capital assets within the south east marine plan area - proposals cannot proceed to (b) unless they have first demonstrated why they cannot meet (a) and so on. Actions that can be carried out to avoid, minimise or mitigate significant adverse impacts on marine natural capital assets will be specific to the natural capital asset under consideration. Decision-makers will assess the use of the mitigation hierarchy on a case-by-case basis.
24. Where it is not possible to mitigate, proposals should demonstrate option (d) and state the case for proceeding including how the proposal supports the High Level Marine Objectives, south east plan vision and other south east plan policies.
25. Inclusion of this information does not indicate that approval for the proposal will follow by default. That will also depend on other material considerations to be taken into account by the decision-maker which may include, for example, other plans.
26. It is important to note that where evidence is not available there may still be habitats and species that are sensitive or of conservation concern. Proposals may require additional and more specific evidence.
27. Where new evidence emerges that improves or changes the evidence provided here, this must be used in applying these policies. Both public authorities and proposals should consider this along with any other evidence gathered.

Public authorities with functions capable of affecting the south east marine plan area should take measures to:

- a.) avoid
- b.) minimise
- c.) mitigate significant adverse impacts on marine or coastal natural capital assets and should seek to enhance marine or coastal natural capital assets where possible.

What is a marine natural capital asset?

1. Natural capital, as defined in the [25 year environment plan](#), is the sum of our ecosystems, species, freshwater, land, soils, minerals, our air and our seas. [Natural capital assets](#) include but are not limited to soil, water, air and all living things and can be referred to as '[stocks](#)'. These are all elements of nature that either directly or indirectly bring value to people and the country at large. They do this in many ways chiefly by providing us with food, clean air and water, wildlife, energy, wood, recreation and protection from hazards.
2. Natural capital is an emerging concept. The approach to defining, identifying and considering marine natural capital assets in decision-making is in development with the current focus on building a common and shared knowledge base to enable understanding of [marine environments in the context of natural capital assets](#). Until the marine natural capital approach is agreed, the more established ecosystem services approach should be considered when applying this policy.

3. The [Ecosystem Approach](#) and [Ecosystem Services Approach](#) are important elements of sustainable development. Ecosystem services are the benefits people obtain from the natural environment. The classification of ecosystem services adopted by the [UK National Ecosystem Approach](#) categorises services as follows: regulating, provisioning cultural and supporting services.
- regulating services for example flood defence and carbon sequestration services (the process of capturing carbon dioxide from the environment) such as sand dunes which act as natural flood defences
 - provisioning services comprise products obtained from the environment such as food and resources for example fish stocks targeted by fisheries
 - cultural services are non-physical and connected to human behaviours and values, for example aesthetic values, cultural heritage values and tourism
 - supporting services are necessary for the function of all other ecosystem services. Impacts on humans from supporting services are likely to be indirect or occur over a long period of time. Examples include oxygen production through photosynthesis, soil formation and retention and habitat provision such as by reefs

What is enhancement?

4. Enhancement refers to measures taken which have a positive impact, for example the creation of saltmarsh habitat as part of a coastal realignment scheme which can provide natural flood and erosion defence while acting as important habitat for wading birds. Environmental enhancement aims to improve the condition of natural capital assets, a knock on effect of which is increased value to people through the benefits of the ecosystem services provided by that asset.

Where are marine natural capital assets in the south east marine plan area?

5. Approaches to identify marine natural capital assets are in development. The ecosystem services present in the south east marine plan area include but are not limited to:
- seagrass beds, such as those along the Southend on Sea coast for example, comprise important nursery habitats for fish species and comprise a buffer to the coast, reducing coastal erosion
 - fish spawning and nursery grounds support fish stocks in the area contributing to the provision of food
 - cultural value in terms of the coastal environment, supporting tourism and cultural heritage
6. The known distribution and location of the habitats can be found in [Marine Information Systems](#).

When are marine natural capital assets present in the south east marine plan area?

7. Ecosystem services, and therefore natural capital, are functional throughout the year. Natural capital associated with recreation the peak is during the spring and summer months when tourism and recreational activities are greatest.

Why are marine natural capital assets important to the south east marine plan area?

8. The importance of natural capital assets in the south east marine plan area is already apparent the [Wallasea Island Coast Project](#) for example. The project is a wetland restoration project restoring the area to a [mosaic of mudflat marshes and lagoons](#). This enhanced habitat comprises important flood defence in the region, supports a diverse range of species and is an attraction for visitors.
9. Habitats such as saltmarshes, seagrass beds and mudflats provide a variety of ecosystem services. Saltmarshes, such as those found in the Medway estuary, provide a natural carbon sequestration service. Saltmarsh habitat is one of the most productive ecosystems in the world and as such can sequester a large amount of carbon. Importantly, due to a lack of oxygen in saltmarsh habitats, the carbon is often shifted from the short term to the long term carbon cycle. When carbon transitions to the long term carbon cycle it takes much longer to be released back into the atmosphere as carbon dioxide, thus contributing to the reduction of carbon emissions. This capability is a valuable asset of many of the world's ecosystems. Areas of saltmarsh habitat in the south east marine plan area include but are not limited to the Medway estuary and along the Essex coast.
10. Seagrass beds, for example as found in the Medway estuary and along the coast of Southend on Sea, are considered to be an important carbon sink and sediment stabilising habitat within the marine environment. Mudflats, also a feature of the Medway estuary, play an important natural role in protecting the coast from flood events by reducing wave energy and buffering flood waters.
11. Marine species such as fish and shellfish are an important component of provisioning services. In the south east marine plan area commercially [targeted species](#) include but are not limited to cockle, lobster, mackerel and cod. Cultural services in the south east marine plan area contribute to health and wellbeing, for example the range of coastal sites on the [Essex coastline](#) which encourage people to spend time outdoors.
12. Supporting services underpin all of the other services and occur throughout the south east marine plan area, these services include primary production by phytoplankton, seagrasses and seaweeds and nutrient cycling aided by burrowing worms in seabed sediments. [Biodiversity](#) is an important component of healthy and resilient ecosystems and is considered fundamental to the success of enhancing natural capital assets.
13. Policy SE-BIO-6 will also aid the achievement of Good Environmental Status for Descriptor 1, 'Biological diversity is maintained. The quality and occurrence of habitats and the distribution and abundance of species are in line with prevailing physiographic, geographic and climatic conditions' as detailed in the [Marine Strategy Part Three: UK Programme of Measures](#).
14. Policy SE-BIO-6 also contributes to the UK high level marine objectives for living within environmental limits and supports the [25 Year Environment Plan](#) aim to protect and grow natural capital and support environmental enhancement. This policy contributes to the sustainable development aims in the [National Planning Policy Framework](#).

Who is this of interest to?

15. Public authorities must have regard for this policy when exercising any function capable of affecting the south east marine plan area, but which are separate from authorisation and enforcement decisions (Section 58(3) of the [Marine and Coastal Access Act 2009](#)). Decisions related to authorisations and enforcement and their potential to disturb components of the ecosystem that generate natural capital are addressed through policy SE-BIO-5. Public authority functions relevant to SE-BIO-6 include but are not limited to:

- strategic planning, including strategies which promote natural capital enhancement in the south east marine plan area
- shoreline manage
- flood and erosion risk management
- fisheries management

How should this policy be applied?

16. This policy should be applied by public authorities when carrying out any function capable of affecting natural capital assets. Where possible, public authorities should build in measures to enhance natural capital assets where possible. This could include innovative design for coastal protection works. Public authority functions should not result in significant adverse impacts on marine or coastal natural capital assets in the south east marine plan area. This could include measures to avoid, minimise or mitigate the impact of tourism through sustainable access management, or by developing tourism strategies that include measures to promote sustainable access.

17. Public authorities should seek advice on how to consider natural capital assets from the statutory nature conservation bodies. Where advice states that it is not possible to assess the impact there will be no further requirements for public authorities to consider the natural capital generation. There is no current guidance on how natural capital is considered in the decision-making process. The requirements on how to consider natural capital under policy SE-BIO-6 may change if guidance is issued.

Policy

SE-CC-1

Proposals must demonstrate that they will, in order of preference: a) avoid, b) minimise, c) mitigate consequences on other activities from unintended greenhouse gas emissions.

What are consequences leading to unintended greenhouse gas emissions?

1. Consequences leading to unintended greenhouse gas emissions are when a proposal's activities unintentionally result in further greenhouse gas emissions from another activity. This can occur outside the proposal's direct footprint. For example, a proposal seeking to generate renewable energy might find a suitable location between the coast and fishing grounds. Construction may affect fishing activity causing vessels to navigate around the development, resulting in an increase in fuel consumption and associated emissions. This would negate some of the benefit of the proposal in terms of low carbon energy generation, as well as affecting the economic viability of the fishing operation.
2. This policy focuses on indirect contributions as the direct contributions are already managed through existing mechanisms and legislation (see signposting). As a result of these existing mechanisms, the South East Marine Plan can add the most value in managing the indirect contributions to climate change.

Where do unintended emissions occur in the south east marine plan area?

3. In the south east marine plan area there is a density of activity in the plan areas with a focus on energy production including oil and gas extraction and renewables,

fisheries activities as well as several ferry routes between the UK and Eire. As an example, any further expansion of existing wind farms should apply this policy to ensure no unintended emissions occur as a result of those proposals causing a diversion or extended route either permanently or during construction.

Applying these data layers (R3 zones, shipping routes, fishing activity activity alongside any relevant layers that may be presented in the future) on the [marine planning evidence base](#) will provide a more accurate picture of activity in the south east marine plan area.

When do unintended emissions take place in the south east marine plan area?

4. There are no temporal constraints on unintended emissions, as they would occur as and when there is an interaction between marine transport (including shipping and fishing vessels) and another constraint upon that transport.

Why are unintended emissions important to the south east marine plan area?

5. The majority of evidence and scientific projections indicate that the climate will continue to change at pace, well into the 21st century and beyond¹. UK carbon budgets are set for four year periods as a means of ensuring progress towards the 2050 target. Carbon budgets have been set up to 2027 and require a 50% reduction below baseline by 2025. Carbon emissions have reduced by over 19% since 2012 and are reducing at about 5% year on year, however the majority of reductions are being made in the power sector². Areas which still need to make improvements are industry, building and transport including marine. Industry, buildings and transport have been addressing consumption intensity over a period of years in response to UK carbon budgets, and the trend is downward for this consumption.
6. The [25 Year Environment Plan](#) which sets out the UK government response to carbon emissions through targets including;
 - clean air
 - thriving plants and wildlife
 - mitigating and adapting to climate change
7. Alongside this the [Clean Growth Strategy](#) sets out a range of approaches to decarbonise the UK while growing the economy. The 25 Year Environment Plan and the Clean Growth Strategy work together to set out a framework for mitigating climate change and this policy is linked to both of those requirements by reducing emissions which will mitigate climate change and reduce carbon..
8. In addition the [Committee on Climate Change](#) sets out policy action to reduce emissions. The South East Marine Plan's contribution to mitigating climate change will be small relative to the scale of the problem. However it is important to address specific issues including the avoidance of unintended consequences on other activities from unintended greenhouse gas emissions.

¹ MCCIP (2017). Marine Climate Change Impacts: 10 years' experience of science to policy reporting. (Eds. Frost M, Baxter J, Buckley P, Dye S and Stoker B) Summary Report, MCCIP, Lowestoft, 12pp. doi: 10.14465/2017.arc10.000-arc <http://www.mccip.org.uk/impacts-report-cards/full-report-cards/>

² <https://www.theccc.org.uk/wp-content/uploads/2017/06/2017-Report-to-Parliament-Meeting-Carbon-Budgets-Closing-the-policy-gap.pdf>

9. The variety of potential development across the south east coast of England has the ability to affect vessel transits across the south east marine plan area. Without consideration of other users and existing activity, such as important shipping and ferry routes, a variety of fishing grounds and windfarm just outside the mouth of the Thames. Proposals may increase unintended emissions, resulting in adverse impacts on climate change
10. This policy is in line with the [Marine Policy Statement](#) (2.6.7) and the [National Planning Policy Framework](#), promoting efficient and effective use of marine space and reduction of conflicts arising from unintended consequences of proposals, such as through displacement, as well as being in line with specific climate change policies.

Who is this of interest to?

11. This policy is of interest to public authorities making decisions that affect the south east marine plan area directly, including local planning authorities and those authorities granting permits or licenses for activity in those areas. It is also of interest to those developing proposals in the south east marine plan area.

How should this policy be applied?

12. Proposals must demonstrate that they will, avoid, minimise, mitigate unintended consequences on other activities. To achieve this, they should consider available evidence and identify interactions which may result in indirect greenhouse gas emissions. In addition to evidence on the location, sources could include but are not limited to the Marine [Planning Evidence Base](#).
13. Proposals should demonstrate that they have considered the interaction between sectors, particularly in relation to indirect consequences on carbon emissions, such as greater travelling distances of vessels from placement of new marine infrastructure resulting in increased fuel consumption.
14. Proposals should demonstrate that they will, in order of preference, avoid, minimise or mitigate unintended consequences on other activities resulting in indirect emission increases - proposals cannot proceed to (b) unless they have first demonstrated why they cannot meet (a) etc.
An example of avoidance would be to allow access to continue unimpeded through their development, not increasing any emissions.
An examples of minimisation would be to consider the access through the development but allow access at certain times on the same route.
An example of mitigation would be to offset the emissions through available methods or provide devices/technology to reduce emissions such as slow steaming, optimising hull design, propeller optimisation, waste heat recovery, energy storage using batteries or shoreside electrical provision or lower carbon fuels.³
15. Inclusion of this information does not indicate that approval of the proposal will follow by default. That will also depend on other material considerations to be taken into

³ [Charting a low carbon future for shipping: A UK perspective](#); Conor Walsh, Sarah Mander, Alice Larkin

account by the decision-maker which may include, for example, other plans. If a proposal cannot meet these criteria it will only be authorised if there are relevant considerations in line with the [Marine and Coastal Access Act 2009\(Section 58\(1\)\)](#).

16. Public authorities should apply this policy proportionally to proposals that have been identified as being likely to affect activities, interests or locations in ways that may increase greenhouse gas emissions. For example competition for space, economic impact, or environmental impacts.
17. Public authorities should not assume that applying this policy to a proposal of low cost or small footprint would always be disproportionate. There may be cases where such proposals have a relatively large effect, for example, in causing a deviation to a busy shipping lane. Public authorities should use the best available advice and evidence in decision-making. For example, local authorities should consult with coastal engineers to consider the interaction between activities and help identify where that may affect emissions.
18. Public authorities should determine on a case-by-case basis which proposals this policy should be applied to, considering the scope of activities and interests affected. The effects should be considered across the proposal's lifetime, so that greenhouse gas emissions are considered cumulatively across the commissioning, operational and decommissioning phases of the proposal rather than at a singular specific point in time. This approach is important as the south east marine plan area has a variety of activity, which will expand over time.
19. Public authorities should request relevant information before proceeding further if it is judged that a proposal has not provided the required information. For example, where inadequate information has been provided to make an informed assessment.
20. Other related policies include:
 - Energy (SE-OG-1, SE-OG-3, SE-REN-1, SE-REN-2, SE-WIND-2)
 - Coexistence (SE-CO-1)
 - Ports and Shipping (SE-PS-1, SE-PS-2, SE-PS-3, SE-PS-4, SE-PS-5, SE-PS-6)

Grouping	Climate change – infrastructure Climate change – species Coastal Change - Infrastructure Coastal Change - natural processes	Code	SE-CC-2

Policy

SE-CC-2

Proposals should demonstrate for the lifetime of the proposal that they:

- 1) are resilient to the effects of climate change and coastal change
- 2) will not have a significant adverse impact upon climate change adaptation measures elsewhere.

In respect of 2) proposals should demonstrate that they will, in order of preference:
a) avoid b) minimise c) mitigate the significant adverse impacts upon these climate change adaptation measures.

What is climate change adaptation and resilience?

1. Climate change adaptation measures help developments or activities to reduce or protect against the impact of climate change ([Marine Policy Statement](#) (2.6.7)). Terrestrial planning policy (NPPF) sets out how adaptation measures may be engineered or may allow a proposal to work with natural processes. Engineered options include relocation of a development, reinforcement of existing dune structures or building a storm surge barrier. All of these adaptation measures increase a proposal's ability to cope with the adverse impacts of climate change. The South East Marine Plan aims to support these measures and not impede terrestrial adaptation and flood defence measures. A range of suggested adaptation methods is set out by the [International Panel on Climate Change \(IPCC\)](#).
2. Resilience to climate change can be generally defined as the capacity for a system or development to absorb stresses and maintain function in the face of external stresses imposed upon it by climate change¹ and adapt, and evolve into more desirable configurations that improve the sustainability of the system, for future climate change impacts². Climate change projections should be considered to make sure the design and operation of a given marine activity and/or proposed management measure (such as a marine protected area designation) are resilient as possible to the effects of climate change, such as coastal change and flooding.

¹ [Resilience: The emergence of a perspective for social–ecological systems analyses](#) Carl Folke

² [Adaptation to Environmental Change: Contributions of a Resilience Framework](#) Donald R. Nelson, W. Neil Adger and Katrina Brown

Where do the effects of climate change occur in the south east marine plan area?

3. Any development or proposal that is below or partially below high water mean springs is potentially at risk of flooding or other adverse impacts of climate change. To identify where these areas are more at risk, these have been mapped by the Environment Agency and are available through their [flood map for planning](#). This map also contains information showing existing flood defences which may inform the location of developments or proposals to benefit from those defences. Some of these areas are already protected by existing measures through terrestrial planning. The South East Marine Plan aims to support these existing measures and not impede existing adaptation and flood defence measures and ensure that new proposals fit effectively with the existing measures.

When does climate change adaptation and resilience take place in south east marine plan area?

4. There are no temporal constraints on climate change adaptation and resilience, as they would occur as and when there is an interaction between a proposal in areas that would likely require an adaptation measure or some resilience to the effect of climate change.

Why is climate change adaptation and resilience important to the south east marine plan area?

5. Climate change adaptation measures help to reduce proposals' vulnerability and that of other developments and activities to the adverse impacts of climate change within the south east marine plan area. The links made above to terrestrial measures such as flood defence help to align new proposals to fit with existing measures that help local areas adapt to climate change.
6. This policy will improve the resilience of developments, activities and ecosystems within the south east marine plan area to the effects of climate change. It will make sure proposals properly consider, and where required, build-in resilience to the effects of climate change. It will also make sure proposals do not compromise other developments, activities and ecosystems (covered in SE-CC-4) in meeting the challenges of climate change. Given the recent flooding in the south east marine plan area due to coastal inundation and also storm events³, it highlights how vulnerable this marine plan area is to the impacts of climate change.
7. This policy gives effect to the [Marine Policy Statement](#) and supports climate change adaptation measures put in place by public authorities adjoining the south east marine plan area. It also responds to the requirements set out in the [25 Year Environment Plan](#) which has a targets focussing on mitigating and adapting to climate change.

³ <https://www.gov.uk/guidance/the-thames-barrier#thames-barrier-closures>

Who is this of interest to?

8. This policy is of interest to public authorities making decisions that affect the north east marine plan area directly, including local planning authorities and those authorities granting permits or licenses for activity in those areas. It is also of interest to those developing proposals in the south east marine plan area.

How should this policy be applied?

9. Proposals should demonstrate that they are resilient to the effects of climate change for the lifetime of the proposal. Proposals that are likely to be at risk from climate change and do not include appropriate adaptation measures to make them resilient, should identify existing measures such as flood defences, providing resilience to any adverse impacts of climate change.
10. Proposals should demonstrate that they have consulted with public authorities⁴ on matters identified in this policy at the earliest opportunity, particularly in relation to considering how proposals avoid adverse impacts upon existing adaptation measures.
11. Proposals that are likely to have a significant adverse impact on existing climate change adaptation measures, such as those highlighted in reports through the [National Adaptation Programme](#), must demonstrate that they will, in order of preference, avoid, minimise or mitigate significant adverse impacts upon these climate change adaptation measures - proposals cannot proceed to (b) unless they have first demonstrated why they cannot meet (a) etc.
12. Inclusion of this information does not indicate that approval of the proposal will follow by default. That will also depend on other material considerations to be taken into account by the decision-maker which may include, for example, other plans. If a proposal cannot meet these criteria it will only be authorised if there are relevant considerations in line with the [Marine and Coastal Access Act 2009](#) (Section 58(1)).
13. Proposals by risk management authorities that relate to the requirements of Flood and Coastal Erosion Risk Management strategies are likely to meet the requirements of this policy through their obligations under [The Flood and Water Management Act 2010](#).
14. Public authorities should request relevant information before proceeding further, if it is judged that a proposal has not provided the required information. For example where inadequate information has been provided to make an informed assessment.
15. Other related policies include:
 - Coexistence (SE-CO-1)
 - Other CC policies (SE-CC-1, SE-CC-3, SE-CC-4, SE-CC-5, SE-CC-6)

⁴ Public authorities are likely to include but not limited to; The Environment Agency, local authorities, Regional Flood and Coastal Committees

Iteration 3 draft

Policy drafting template SE-CC-3

HLMO	Living within environmental limits	Sub bullet(s)	Healthy marine and coastal habitats occur across their natural range and are able to support strong, biodiverse biological communities and the functioning of healthy, resilient and adaptable marine ecosystems.
Grouping	Coastal change	Code	SE-CC-3

Policy

SE-CC-3

Proposals in the south east marine plan area and adjacent marine plan area that are likely to have a significant adverse impact on coastal change should not be supported.

What is coastal change?

1. Coastal change is defined as ‘physical changes to the shoreline for example erosion, coastal landslip, permanent inundation and coastal accretion’¹. The effects of these climate change processes will be most prevalent in coastal areas of the south east inshore plan area due to changes in waves, wind and tide which alter dominant coastal processes influencing landforms. Changes may pose a risk to coastal areas and activities identified as vulnerable to this change² as set out below.
2. Coastal narrowing (or coastal squeeze) is one manageable aspect of coastal change that can be influenced.³ Areas at risk of coastal erosion have been identified in the south east inshore marine plan area⁴. MMO 1168 (which is in progress) sets out what is defined by ‘coastal squeeze’.

Where does coastal change occur in the south east marine plan area?

3. Coastal change is happening in more vulnerable areas across the south east inshore marine plan area. These are identified in the [Thames 2100](#) plan. There are key areas identified along the Thames and also around the coast into both Kent and Essex. In the [Medway and Swale](#) a coastal risk management strategy is currently being developed and in Essex it has been [published](#).

¹ HM Government, [Marine Policy Statement](#) (2011) (2.6.8.1)

² *ibid*

³ Coastal narrowing can be defined as: “A reduction in the coastal zone width caused by human and/or natural process” Doody, J.P 2013

⁴ <https://www.gov.uk/check-plans-to-stop-coastal-erosion-in-your-area>

When does coastal change occur in the south east marine plan area?

4. Coastal change can happen at any time in the south east marine plan area. Coastal change is triggered by a range of natural weather events, storms or man-made occurrences such as activity affecting the integrity of cliffs/other developments. In the winter there is a higher risk of coastal change occurring due to increased storminess and the natural tendency for more rainfall. However this does not exclude other times as sudden weather events such as drought, storms or flash flooding could also have adverse impacts.

Why is coastal change important to the south east marine plan area?

5. Coastal change is a particularly important issue in the south east marine plan area because a large proportion of the coastline is subject to or vulnerable to change. Coastal change can impact on the people, assets and resources (including natural flood defences such as saltmarsh (see also SE-BIO policies)) in, or dependent on, the marine plan area as outlined in [Thames 2100](#). [Thames 2100](#) also identifies government, commerce, people, heritage and culture, transport, port of London and London Gateway, and nature conservation as being at risk of coastal change and flooding. This identification of areas of risk applies widely across the south east inshore plan area. Preventing the risks involved to these areas, and dealing with impacts when they occur, requires significant resource. A range of existing measures as set out in [Thames 2100](#) are in place to achieve successful management in the face of coastal change. Marine plans play an important part in this management of coastal change, including ensuring decisions in the marine area avoid exacerbating detrimental coastal change and do not compromise, and preferably complement, existing measures.
6. This policy will complement other measures to manage coastal change and also support the need for resilience and adaptation along the coastline of the south east inshore plan area to benefit all users, in line with the Marine Policy Statement (2.6.7 and 2.6.8) and the [UK Climate Change Risk Assessment Report](#)⁵. Adaptation measures are covered explicitly through policy SE-CC-2. This policy also gives effect to the Marine Policy Statement (2.6.8.5).
7. A range of existing plans (including local plans) contain assessments and measures to address coastal change. There are six [shoreline management plans](#) that are relevant to the south east inshore marine plan area and include projections of coastal change over three epochs (20, 50 and 100 years) and how management can respond to these impacts. This policy complements these plans, particularly for locations identified as coastal change management areas. This policy ensures that marine based proposals do not have a significant adverse impact on coastal change on land. Also it coordinates related cross-boundary issues from marine plan area to marine plan area or from the sea to land, ensuring that cross boundary proposals are properly planned. Collaborative working within catchment partnership or flood risk management groups will help to provide this coordination.

⁵ <https://www.theccc.org.uk/tackling-climate-change/preparing-for-climate-change/uk-climate-change-risk-assessment-2017/> recommends potential adaptation measures to take forward to reduce the impact of climate change on the coast.

Who is this of interest to?

8. Public authorities with an interest in coastal protection or flood risk management as well as those developing proposals that may have an effect on coastal change.

How should this policy be applied?

9. This policy recognises changes to the coastline (for example managed realignment) can be beneficial for flood risk management, communities and biodiversity. It does not therefore look to restrain coastal defence or flood risk management proposals that will stabilise, reinforce or purposefully alter the coastline with the express aim of reducing vulnerability to coastal change.
10. Proposals should demonstrate they have consulted with relevant public authorities^{6 7 8}. Specifically the Environment Agency, Catchment Partnerships, relevant Coast Protection Authorities, coastal groups and/or lead local flood authorities. Consultation should be carried out at the earliest opportunity, particularly in relation to considering how proposals might help support existing coastal adaptation policies.
11. Proposals should demonstrate they have taken into account existing plans, such as shoreline management plans, estuary management plans and other local level plans such as local flood risk management plans and strategies as well as beach management plans where applicable. Proposals by risk management authorities that relate to the requirements of Flood and Coastal Erosion Risk Management strategies are likely to meet the requirements of this policy through their obligations under The Flood and Water Management Act 2010. Indeed, wider improvements to resilience could be considered mitigating factors to demonstrate that certain coastal management schemes will not have an overall significant adverse impact on coastal change.
12. Proposals should consider relevant shoreline management plan policies to make sure that any impact does not cause unintended consequences further along the coast.
13. Public authorities should always consider this policy when assessing proposals that are likely to have a significant adverse impact on coastal change. This may include large proposals such as those requiring an environmental impact assessment or a strategic environmental assessment. This includes when a proposal affects the vulnerability of other users, or if change is on a scale of, or above, that of shoreline management plan units (where a coastal management decision has been taken).

⁶ Coastal groups comprise all key partners in coastal management, principally those from the Environment Agency, maritime local authorities and port authorities. The South East Marine Plan is covered by the [South East and East Anglian Coastal Groups](#)

⁷ In two tier local government the district council remains responsible for coast protection, while flooding is managed by the county

⁸ Management of Coastal change and flood risk management is the responsibility of the Environment Agency, lead local authorities and others as indicated by relevant Shoreline, Estuary or River Basin Management plans.

14. Public authorities should not give consent for proposals which adversely affect areas at risk, or those of high probability of coastal change.⁹
15. Public authorities should also apply this policy to proposals in adjacent terrestrial areas due to the interconnected nature of terrestrial and marine processes.
16. Public authorities and proposals should consider, where appropriate, the wider benefits of soft coastal defence strategies¹⁰ and managed realignment schemes in place of hard defences. Future proposals in the adjacent offshore marine plan areas may have potential significant adverse impacts on coastal change and consideration should be given on a case-by-case basis whether they should be supported.
17. In applying this policy the term adjacent is taken as to be close by, by the side of, or bordering on the marine plan area.

Policy

SE-CC-4

Proposals that enhance habitats that provide a flood defence or carbon sequestration will be supported. Proposals that may have a significant adverse impact on habitats that provide a flood defence or carbon sequestration ecosystem service must demonstrate that they will, in order of preference:

- a) avoid
- b) minimise
- c) mitigate significant adverse impacts

What are ecosystem services?

1. Ecosystem services are the benefits people obtain from ecosystems.¹ The classification of ecosystem services adopted by the [Millennium Ecosystem Assessment](#) categorises services as follows: provisioning, regulating, cultural and supporting services.² Flood defence and carbon sequestration services (the process of capturing carbon dioxide from the environment) are regulating services.
2. Habitats such as saltmarshes, sand dunes, seagrass beds and mudflats, provide a variety of ecosystem services. Saltmarshes and mudflats play an important natural role in protecting the coast from flood events, by reducing wave energy and buffering flood waters. Well-developed sand dune systems act to stabilise sediments, therefore reducing coastal erosion.
3. The habitats that provide these ecosystem services also provide a natural carbon sequestration service. Salt marsh habitat is one of the most productive ecosystems in the world and as such can sequester a large amount of carbon. Importantly due to the anoxic (without oxygen) nature of this habitat, the carbon is often shifted from the short term to the long term carbon cycle. This capability is a valuable asset of many

¹ [UK National Ecosystem Assessment](#) (2011) Chapter 12 Marine

² [UN millennium Ecosystem Assessment](#) (2005) Consequences of Responses for Poverty Reduction, Ecosystem Services and Human Well-being

of the world's ecosystems.³ Seagrass beds are also considered to be an important carbon sink and sediment stabilising habitat within the marine environment⁴.

Where are ecosystem services in the south east marine plan area?

4. There is a significant amount of saltmarsh areas, sand dunes, seagrass beds and mudflats in the south east marine plan area. Please see the habitats and species layers on the [Marine Information System](#) for their distribution.

When do ecosystem services occur south east marine plan area?

5. These ecosystem services operate all year round. Seagrass⁵ has little variation in capacity or effectiveness throughout the seasons, however salt marsh⁶ in UK waters does vary in extent and capacity for carbon sequestration.

Why are ecosystem services important to the south east marine plan area?

6. Healthy marine ecosystems ensure their own resilience to the effects of climate change, and provide natural resilience for coastal communities. Carbon sequestration by natural habitats is important for the natural carbon cycle and provides a natural carbon sink. Potential future residential and industrial development within and adjacent to the south east inshore marine plan area could conflict with habitats and species important for these two regulatory ecosystem services. The south east inshore marine plan area's mudflat and saltmarsh habitats in particular are considered in poor condition and declining⁷. Set in the context of the south east marine plan area being so busy for a wide variety of activities, these areas are particularly important because of the flood risk to new development in the area alongside natural defences being preferred over man-made.
7. Effective management of marine ecosystems can be considered a climate change adaptation measure necessary to deal with the potential impacts of climate change.⁸ Preventing adverse impacts of proposals on habitats that provide natural flood defences can also reduce the need for additional artificial and costly flood defences.⁹
8. Implementing this policy will also complement plan policies and national duties relating to biodiversity such as those outlined in the [25 Year Environment Plan](#) evidence report and the [Marine Policy Statement](#).
9. This policy will also aid in the achievement of Good Environmental Status for descriptor 1 of [Marine strategy part one: UK initial assessment and good](#)

³ Nalini S. Rao, et al (2015) [Global values of coastal ecosystem services: A spatial economic analysis of shoreline protection values](#) and Barbier, E.B. et al (2011) [The value of estuarine and coastal ecosystem services](#). *Ecological Monographs* 81: 169 – 193

⁷ MMO (2018) <https://www.gov.uk/government/publications/marine-planning-issues-and-evidence-database>

⁸ HM Government, [Marine Policy Statement](#) (2011), (2.6.7.3)

⁹ [UK Climate Change Risk Assessment Report](#)

[environmental status](#) and contribute to the UK's high level marine objectives for living within environmental limits.

10. Alongside this the [Clean Growth Strategy](#) sets out a range of approaches to decarbonise the UK while growing the economy. The 25 Year Environment Plan and the Clean Growth Strategy work together to set out a framework for mitigating climate change and this policy is linked to both of those requirements.

Who is this of interest to?

11. The broad nature of this policy and the many activities and resources it covers means it relates to a range of national policy areas for which different government departments are responsible. Departments with specific responsibilities include:
- Department for Environment, Food and Rural Affairs – climate change adaptation, flood and coastal risk management, ecosystem services
 - Department for Business, Energy and Industrial Strategy – energy demand reduction in industry, business and the public sector, greenhouse gas emissions and climate change mitigation
 - Ministry of Housing, Communities and Local Government – overlap at the coast with the land-use planning system
 - Department for Transport – relevant to harbour authorities and the Transport and works Act (1992)
12. This policy is also relevant to public authorities making decisions relating to the sectors and resources mentioned above. For example the Environment Agency sets direction for flood and coastal risk management in England. In doing so they work in association with local authorities including through the development and implementation of shoreline management plans.

How should this policy be applied?

13. Proposals must demonstrate that they have considered available evidence and identified any significant adverse impacts on habitats that provide flood defence and/or carbon sequestration ecosystem services. For example, evidence on the location could include the South East Marine Plan and associated documents and the [Marine Information System](#)
14. Proposals should identify and describe habitats within the immediate vicinity and determine whether those habitats provide carbon sequestration or flood defence ecosystem services.
15. Proposals must demonstrate that they will, in order of preference, avoid, minimise or mitigate significant adverse impact on habitats that provide a flood defence or carbon sequestration ecosystem service. For example:
- avoid – through alternative locations
 - minimise – minimising the size of structures (see also policies SE-CO-1 and SE-BIO-1) or the amount of timework is undertaken to make sure natural processes can continue
 - mitigate – innovative engineering design, sediment bypassing to avoid sediment loss or reductions to the overall size and scope of a project

16. Proposals cannot proceed to (b) unless they have first demonstrated why they cannot meet (a) etc.
17. Inclusion of this information does not indicate that approval of the proposal will follow by default. That will also depend on other material considerations to be taken into account by the decision-maker which may include, for example, other plans. If these criteria cannot be met, proposals will only be authorised if there are relevant considerations in line with the Marine and Coastal Access Act (2009)(Section 58(1)).
18. Where proposals enhance the size and/or extent of functioning habitats that provide a flood defence or carbon sequestration service they should be supported.
19. Proposals and public authorities must take into account where relevant, all current publically available evidence relating to habitats providing relevant ecosystem services. The [Marine Information System](#) contains information showing habitats of conservation importance and species and habitats that are particularly threatened, rare, or declining. The information also indicates the location of several habitats highlighted within this policy - coastal salt marsh and seagrass bed habitats. The absence of evidence does not mean absence of habitats that provide flood defence and carbon sequestration ecosystem services.
20. Additional proposal specific evidence may be required. Where new evidence emerges that improves or changes the evidence provided here, this must be taken into account in applying the policy.
21. Proposals within Natura 2000 sites will require additional assessment measures. The definitions of avoidance, mitigation and compensation are defined under the [National Planning Policy Framework](#) (paragraph 118).
22. Proposals are required to be in compliance with relevant legislation and regulations including [The Conservation of Habitats and Species Regulations \(2017\)](#), [The Infrastructure Planning \(Environmental Impact Assessment\) Regulations \(2017\)](#), [The Water Environment \(Water Framework Directive\) \(England and Wales\) Regulations 2017](#) and [National Policy Statements](#) where they apply.
23. Public authorities must apply this policy where the best available evidence indicates that it is appropriate to do so.
24. Public authorities must apply this policy proportionally for proposals that will interact with habitats that provide the listed ecosystem services (flood defence and carbon sequestration).
25. Public authorities must request required information where it is judged that this policy has not been sufficiently addressed before proceeding. For example, inadequate information has been provided to make an informed assessment.

Policy drafting template SE-CC-5

HLMO	Living within environmental limits	Sub bullet(s)	Biodiversity is protected, conserved and where appropriate recovered and loss has been halted.
Grouping	Climate Change - Species	Code	SE-CC-5

Policy

SE-CC-5

Public authorities with functions capable of affecting the marine area should:

1. consider long-term climate change projections and associated effects, including, but not limited to, the space required for the redistribution of priority habitats and species
2. consider support for people, infrastructure and components of the marine ecosystem that generate natural capital in adapting to change during their lifetime
3. not result in greenhouse gas emissions caused by unintended consequences on other activities
4. not lead to unnecessary increased demand for coastal protection in the future

What are long term climate change projections?

1. Climate change is the process of the planet warming. The Earth has warmed by an average of 1°C during the 20th century. Whilst the overall change is small it has significant impacts for the environment and people everywhere. Rising temperatures and changing climate make the weather more extreme and unpredictable. As temperatures rise, many species will need to find ways to adapt to the changing climate.
2. The main causes are:
 - burning of fossil fuels,
 - farming and methane release from animal farming, and
 - deforestation
3. The impacts of these causes on the climate are:
 - increased storminess (rainfall)
 - changing seasons
 - shrinking sea ice
 - rising sea levels
4. The main considerations in the south east marine plan area are rising sea level and increased rainfall. These effects are being projected by the [UK climate change projections](#). The projections were last published in 2009 and are currently being revised for publication in 2018.

What is natural capital and adaptation?

5. Natural capital is the sum of our ecosystems, species, freshwater, land, soils, minerals, our air and our seas. These are all elements of nature that either directly or indirectly bring value to people and the country at large. They do this in many ways

chiefly by providing us with food, clean air and water, wildlife, energy, wood, recreation and protection from hazards.

6. Adaptation is the ability of habitats, species and populations to respond to changes in the environment. Adaptation includes the natural succession of habitats and range shifts in response to climatic and other environmental changes. The ability of habitats and species to adapt to climate change is also addressed by policies SE-BIO-01, SE-CC-XX, SE-CC-1.

What are unintended greenhouse gas emissions? (see also SE-CC-1)

7. Unintended emissions are when any proposal's activities unintentionally result in further greenhouse gas emissions from another activity. This can occur outside any proposal's direct footprint. For example, any proposal seeking to generate renewable energy might find a suitable location between the coast and fishing grounds. Construction may affect fishing activity causing vessels to navigate around the development, resulting in an increase in fuel consumption and associated emissions. This would negate some of the benefit of any proposal in terms of low carbon energy generation, as well as affecting the economic viability of the fishing operation.

What is coastal protection? (see also SE-CC-3)

8. Coastal protection measures address coastal change, which is defined as 'physical changes to the shoreline for example erosion, coastal landslip, permanent inundation and coastal accretion'¹. The effects of climate change will be most prevalent in coastal areas of the south east inshore plan area due to changes in waves, wind and tide which alter dominant coastal processes influencing landforms. Changes may pose a risk to coastal areas and activities identified as vulnerable to this change².
9. Coastal narrowing (or coastal squeeze) is one manageable aspect of coastal change that can be influenced.³ Areas at risk of coastal erosion have been identified in the south east inshore marine plan area⁴. MMO 1168 (which is in progress) sets out what is defined by 'coastal squeeze'.

Where does climate change occur in the south east marine plan area?

10. Climate change is a global issue and affects the south east marine plan area as a whole. Small incremental steps considering the effects of climate change will help to mitigate this world-wide problem. The effects of increased storminess will be felt in areas where coastal change is occurring as shown in the [XXX] layer on the [Marine Information System](#).

When does climate change occur in south east marine plan area?

11. Climate change is happening now and will continue to affect the south east marine plan area over the long-term. Due to the time lag in the climate system, even with the most ambitious mitigation efforts, we are likely to experience a further amount of

¹ HM Government, [Marine Policy Statement](#) (2011) (2.6.8.1)

² ibid

³ Coastal narrowing can be defined as: "A reduction in the coastal zone width caused by human and/or natural process" Doody, J.P 2013

⁴ <https://www.gov.uk/check-plans-to-stop-coastal-erosion-in-your-area>

climate change over the coming decades. There are seasonal impacts for example warmer wetter summer causing localised flooding or increased storm outflows into the marine area.

Why is consideration of the climate change projections important to the south east marine plan area?

12. Consideration of these projections is vital to ensuring that future developments and approaches to terrestrial activities that could be at risk of the effects of climate change are protected. If these projections are considered effectively, people, infrastructure and components of the marine ecosystem that generate natural capital in adapting to change during their lifetime are protected.

Who is this of interest to?

- Public authorities with land management or strategic planning functions which allow activities to:
 - affect space required for the redistribution of priority habitats and species,
 - cause unintended emissions
 - affect natural capital
 - require additional coastal protection
- Planning Inspectorate when approving strategic plans that could lead to impacts upon space for priority habitats and species, cause unintended emissions or affect natural capital
- Public authorities that develop River Basin Management Plans and other land management plans capable of affecting the marine area
- Inshore Fisheries and Conservation Authorities – management of commercial fisheries for the purposes of environmental protection

How should this policy be applied?

13. SE-CC-5 applies to the whole of the south east marine plan area and extends to functions that are carried out in adjacent marine plan area which are capable of affecting the marine area, including east and Scottish waters across the coast and in estuarine areas.
14. Policy SE-CC-5 aligns with the [Marine Policy Statement](#), the [National Planning Policy Framework \(2018\)](#) and the [Marine and Coastal Access Act](#) (section 58 (3)). It also complements the actions of the [Marine Strategy](#).
15. This policy should be considered when developing strategic plans and programmes which may have an impact on priority habitats and species, be a cause of unintended emissions, require additional coastal protections or affect natural capital.
16. Public authorities should consider impacts on priority habitats and species, causes of unintended emissions, or impacts on natural capital when authorising land-based infrastructure. Examples of land-based infrastructure that should be considered include waste water, sewage treatment, housing developments close to coastal or estuarine areas. Infrastructure to support recreational, residential and commercial boating and shipping activities is included. See also SE-INF-1.

17. The South east Marine Plans build on existing measures, consistent with the [Marine Policy Statement](#) (2.5.6, 2.6.7 and 3.3.2) and [National Planning Policy Framework](#) (2018) (Chapter 14 – climate change, Chapter 15 – natural capital) through ensuring public authorities consider impacts climate change adaptation and mitigation, as well as opportunities to support natural capital.

Policy

SE-CC-6

Proposals that reduce or buffer carbon dioxide concentrations in seawater should be supported.

What is reduction or buffering of carbon dioxide?

1. Buffering capacity is the ocean's capacity to soak up acid or alkali. Carbon dioxide concentrations are naturally 'buffered' or reduced by the salts in the seawater. Dissolved carbon dioxide from the atmosphere is balanced with bicarbonate and carbonic acid. Increased emissions from human activity, mainly from burning of fossil fuels, farming and methane release from animal farming have increased carbon dioxide levels in the atmosphere. In turn causing an increase in dissolved carbon dioxide in the world's oceans and as a result of this increase, a change in pH level of oceans. As the concentration of dissolved carbon dioxide increases, the rate of the forward reaction of the buffering system increases until the system reaches a new natural level. This means that an increase in dissolved carbon dioxide causes a slight decrease in pH. The ocean's buffering capacity is very large, but changes to the oceans' pH level - acidification - can have wide ranging impacts habitats and species.
2. Measurements and models indicate that this carbon dioxide uptake has resulted in a global mean pH decrease of 0.1 units in surface waters since pre-industrial times. On current trends, the total mean decrease is projected to reach 0.4 units (an increase of H⁺ of around 170%) by 2100, with potentially serious consequences for many marine ecosystems.¹

¹ http://www.oceanacidification.org.uk/Oarp/media/images/PDF/UKOA-Variability_Trends.pdf

Where does ocean acidification occur in the south east marine plan area?

3. Across the plan area seawater has a variation in pH depending on its location and how much freshwater enters the system, creating areas of brackish water. The UK Ocean Acidification project states “Seawater pH around the UK is highly variable, both spatially (in three dimensions) and temporally (year-to-year, seasonally and on shorter time-scales); there is now in place a national ocean acidification observing system which needs to be continued on a long-term basis”.² As a result the carbon dioxide buffering opportunities exist all over the marine plan area.

When does ocean acidification take place in south east marine plan area?

4. According to the UK Ocean Acidification project, “acidification is not occurring uniformly everywhere; evidence from the scattered measurements available suggests that surface pH varies substantially. Variations can be on a local and regional space scales; also on daily, seasonal, annual and decadal time-scales, and with water depth. These natural variations form the (changing) ‘baseline’ against which further human-caused changes may be measured. Acidification that moves the natural system beyond its existing variations is likely to be more damaging than changes that remain within natural bounds.”³ In the south east marine plan area there is some variation in salinity but as there is limited data it is difficult to identify where these variations occur. There is some broad scale analysis from satellite mapping completed by the UK Ocean Acidification project which helps to identify some of these variations.⁴

Why is reducing ocean acidification important to the south east marine plan area?

5. Reducing the impact of ocean acidification is important to the south east marine plan area because of the reliance of many habitats and species and associated industries on sea water with a ‘normal’ pH level.
6. Species which create shells, skeletons or structures from calcium carbonate are at risk. Species that use aragonite (corals, mussels) or high-magnesium calcite (sea urchins) are especially sensitive to variation in ocean pH. If they are unable to build shells, it may make these organisms more vulnerable to predators. Cold-water corals and shell-forming organisms are thought to be especially vulnerable. Changes in ocean pH also may have other more indirect impacts like changes in metabolism on a variety of habitats and species.⁵ Industries that rely on good quality shellfish are most at risk, such as fishing, potting, aquaculture and any related processing of the catch.

Who is this of interest to?

7. Developers when preparing proposals which may affect the carbon buffering cycle in the south east marine plan area.

² http://www.oceanacidification.org.uk/Oarp/media/images/PDF/UKOA-Variability_Trends.pdf

³ ibid

⁴ <https://pubs.acs.org/doi/jpdf/10.1021/es504849s> Environmental Science and Technology ‘Salinity from Space unlocks Satellite-based assessment of Ocean Acidification’.

8. Decision-making public authorities including:
 - Local planning authorities
 - Marine licensing authorities
 - The Planning Inspectorate
 - The Crown Estate
 - Inshore Fisheries and Conservation Authorities
 - Department of Business, Energy and Industrial Strategy
 - Maritime and Coastguard Agency
9. Advisory public authorities including:
 - Centre for Environment, Fisheries and Aquaculture Science
 - Joint Nature Conservation Committee
 - Natural England

How should this policy be applied?

10. Decision-makers should support proposals that incorporate measures that result in a reduction or buffering of carbon dioxide concentrations in the south east marine plan areas' seawater. This may include novel designs of proposals or, and collaboration between developers and public authorities. Proposals must comply with relevant legislation and other marine plan policies.
11. SE-CC-6 requires decision makers to consider supporting proposals that manage any adverse impacts that may affect the pH of seawater in the local area which in turn affect the functioning of marine habitats and species. Policy SE-CC-4 is also relevant here.
12. Determination may be informed by a relevant assessment. An assessment to determine how a proposal can be beneficial to a reduction in carbon dioxide concentrations in seawater.
13. Proposals are still required to be in compliance with relevant legislation and regulations including Conservation of Habitats and Species Regulations 2017, Conservation of Offshore Marine Habitats and Species Regulations 2017, Marine and Coastal Access Act, Environmental Impact Assessment also other national legislation such as The Eels (England and Wales) Regulations 2009, Salmon and Fresh Water Fisheries Act 1975 and National Policy Statements where they apply.
14. It is helpful to identify the location of features and sites within the south east marine plan areas that are most affected by an increase in seawater pH as well as those important for wider biodiversity, including beyond marine protected areas.
15. Proposals should consider the available evidence and identify any significant adverse impacts on habitat and species.
16. Inclusion of this information does not indicate that approval of the proposal will follow by default. That will also depend on other material considerations to be taken into account by the decision-maker which may include, for example, other plans.

Grouping	Cumulative effects	Code	SW-CE-1

Policy

SE-CE-1

Proposals which may have cumulative or in-combination effects with other existing or authorised developments or activities must demonstrate that they will, in order of preference, a) avoid, b) minimise, c) mitigate significant cumulative or in-combination effects.

What are cumulative and in-combination effects?

1. Cumulative effects are the combined, similar, environmental effects that result from incremental changes caused by other past, present or reasonably foreseeable actions together with the current proposal. Cumulative effects may extend beyond the geographical site boundaries of proposals. Cumulative effects are made up of additive effects (the magnitude of the combined effects equal the sum of the individual effects) and synergistic effects (combined effects lead to an increased effect, greater than the individual effects).
2. In-combination effects refer to the, differing, additive or synergistic effect from multiple projects or activities on a single receptor or ecosystem. In-combination assessment ensures holistic protection for biodiversity by preventing many different projects or activities causing minor adverse impacts alone, but having a significant overall adverse impact to a habitat or species.
3. The terms “cumulative”, “in combination” and “collective” are effectively intended to achieve the same objective (i.e. describe the overall impact on single or multiple receptors from single or multiple pressures). In legislation these terms are used in the following way:
4. 1. [The Conservation of Habitats and Species Regulations 2017](#) and the [Conservation of Offshore Marine Habitats and Species Regulations 2017](#) refer to ‘in-combination effects’ which is commonly understood to mean the same environmental receptor being affected in different ways from one or more schemes.

For example, an infrastructure project and a dredging scheme may occur on or around a biogenic reef. The infrastructure project may remove parts of the reef whilst the dredge projects may increase suspended sediments which have the potential to smother the reef. These effects individually may not adversely affect the feature but together they affect the overall condition of the reef.

5. [2. The Marine Works \(Environmental Impact Assessment\) Regulations 2017](#) describes 'cumulative effects' as similar impacts from multiple schemes on the same environmental receptor. For example, multiple offshore wind farms piling at the same time could cause significant disturbance or injury to marine mammals. One or two piling events happening at the same time may not breach the animals' hearing thresholds but many events occurring simultaneously may disturb or injure individuals.
6. Cumulative effects can arise from a range of pressures, such as (but not limited to) disturbance or damage to the seabed, increases in underwater noise, pollution and increases in marine litter. Cumulative effects can occur both spatially and temporally. The effect of such pressures and whether or not they have an impact will depend on the sensitivity of the components of the ecosystem that are affected and the level of exposure to those pressures.

Where do cumulative and in-combination effects occur in the south east marine plan area?

7. Cumulative effects can occur anywhere throughout the south east marine plan area but may be more pronounced in areas of high marine activity such as the Thames Estuary. The [Marine Information System](#) should be consulted to identify local habitats and species in areas that could be at risk to cumulative effects.

When do cumulative and in-combination effects occur in the south east marine plan area?

8. During the lifetime of the south east marine plan negative effects caused by proposals can accumulate and become amplified. Cumulative effects can intensify at any time of the year depending on when the project is implemented. The intensity of effects may vary seasonally depending on local currents and weather amongst other biotic or abiotic factors.
9. The species and habitats that are impacted, and the extent to which they are impacted, may vary on a temporal scale. For example, intertidal mudflats in the south east are an important feeding ground for migratory birds and worsening cumulative effects may have delayed impacts on migratory species on their arrival.

Why are cumulative and in-combination effects significant in the south east marine plan area?

10. The south east coastal habitats consist of specific areas of low lying mudflats including the Southend Flats and Chapman Sands, shallow muddy creeks and broad tracts of tidal salt marsh. The area is of international importance for bird species and large swathes of its semi-natural habitat are designated as a Special Protection Area (SPA). Furthermore, the sand and gravel seabed of the Kentish Knock contains a diversity of animals living within the sediment, including catsharks hermit crabs and

small sand goby fish hunting on the sandbanks. As a result it is important to protect these areas from cumulative effects particularly in areas of high activity and development where cumulative effects are amplified. In accordance with the [Marine Policy Statement](#) and the [25 Year Environment Plan](#) it is vital that biodiversity is maintained in order to ensure that resources are sustained in a productive state for use in future as well as achieving protection of nature for its intrinsic value.

11. Singular activities analysed in isolation may have little to no impact upon marine areas. However, the cumulative pressure of multiple activities within or adjacent to marine areas can threaten the maintenance and restoration of favourable conservation status. This policy intends to ensure that cumulative effects are considered in the application and decision making process. It does not matter how small the proposal is, it may induce a tipping point where cumulative effects become critically detrimental.
12. Compared to terrestrial environments, cumulative effects are exaggerated in the marine area due to the lack of physical boundaries. Therefore, it is important for any marine proposal to proactively avoid, minimise or mitigate significant negative cumulative effects to prevent wide ranging negative impacts to the environment both within and adjacent to the south east marine plan area.
13. As the south east marine plan area shares a border with the [South Marine Plan](#) areas and [East Marine Plan](#) areas, as well as the French marine area, it is vital to consider cumulative effects at boundary limits and encourage cross border planning.
14. As set out in the [Marine Policy Statement](#) (2.3.1.6 and 2.3.2.1), marine plans should contribute to considering cumulative impacts, for example 'Marine plans should ... identify how the potential impacts of activities will be managed, including cumulative effects' and 'when considering the potential benefits and adverse effects, decision-makers should also take into account any multiple and cumulative impacts of proposals, in the light of other projects and activities'.

Who is this of interest to?

15. The following government departments have decision-making and regulatory functions that will apply this policy:
 - Department for Environment Food and Rural Affairs
 - Department for Digital, Culture, Media and Sport
 - Ministry of Housing, Communities and Local Government
 - Department for Business, Energy and Industrial Strategy
16. The following authorities are responsible for decision-making in relation to this policy:
 - Port and Harbour Authorities
 - Marine Management Organisation
 - Natural England
 - Environment Agency
 - Planning Inspectorate
 - Local Planning Authorities
 - Offshore Petroleum Regulator for Environment and Decommissioning
 - Oil and Gas Authority

How should this policy be applied?

17. Proposals must demonstrate that they have considered the cumulative and in-combination impacts that they may have on the south east marine area. Proposals that are likely to have significant cumulative or in combination impacts on the south east marine area must demonstrate that they will, in order of preference, avoid, minimise or mitigate any significant adverse cumulative or in-combination effects - proposals cannot proceed to (b) unless they have first demonstrated why they cannot meet (a) etc.
18. This policy intends to ensure that proposals consider the cumulative and in-combination effects of past and future projects and takes the steps needed to restrict or prevent the accumulation or intensification of significant adverse impacts to the environment and sensitive species. The policy is also intended to ensure that all proposals provide consideration of their impact in combination with other projects on all habitats and species whether they are designated or not.
19. When considering such effects, proposals should consider other projects or activities likely to negatively affect habitats and species. Proposers must therefore provide adequate assessment of their impacts in order for decision-makers to make their decision. Proposals must clearly illustrate the negative and/or positive cumulative effects that the project will have.
20. Public authorities should look to make sure that current and future guidance as it becomes available is clearly highlighted, applied and reviewed (where required), working with, for example, the Joint Nature Conservation Committee and Natural England, The Crown Estate and industry.
21. Proposals must consider the natural pressures upon the environment where possible in addition to the proposed activity and any current and forecasted future use of the area and consider the short and long term cumulative and/or in-combination effects of these activities upon marine species and habitats.
22. Proposals should consider how cumulative effects, as a result of the proposed project, have impacts on the [South Marine Plan](#) areas, [East Marine Plan](#) areas and French marine area.
23. Decision makers should fully assess current and forecasted future use of the marine plan area and consider the short and long term cumulative and/or in-combination effects of these activities upon marine species and habitats.
24. In examining and determining applications for nationally significant infrastructure projects, examining authorities and the secretary of state for The Ministry of Housing, Communities and Local Government must have regard to this policy for nationally significant infrastructure projects that may have cumulative or in-combination effects with other existing or authorised developments or activities.

Iteration 3 draft

Policy drafting template SE-CE-2

HLMO	Promoting good governance	Sub bullet(s)	The use of the marine environment is spatially planned where appropriate and based on an ecosystems approach which takes account of climate change and recognises the protection and management needs of marine cultural heritage according to its significance
Grouping	Cumulative effects	Code	SE-CE-2

Policy

SE-CE-2

Proposals should provide information to address the cumulative effects arising from the proposed project upon the environment within and adjacent to the marine plan area.

What are cumulative effects?

1. Cumulative effects are the combined environmental effects that result from incremental changes caused by other past, present or reasonably foreseeable actions together with the current proposal. Cumulative effects may extend beyond the geographical site boundaries of proposals. Cumulative effects are made up of additive effects (the magnitude of the combined effects equal the sum of the individual effects) and synergistic effects (combined effects lead to an increased effect, greater than the individual effects).
2. [The Marine Works \(Environmental Impact Assessment\) Regulations 2017](#) describes 'cumulative effects' as similar impacts from multiple schemes on the same environmental receptor. For example, multiple offshore wind farms piling at the same time could cause significant disturbance or injury to marine mammals. One or two piling events happening at the same time may not breach the animals' hearing thresholds but together they may disturb or injure individuals.
3. Cumulative effects can arise from a range of pressures, such as (but not limited to) disturbance or damage to the seabed, increases in underwater noise, pollution and increases in marine litter. Cumulative effects can occur both spatially and temporally. The effect of such pressures and whether or not they have an impact will depend on the sensitivity of the components of the ecosystem that are affected and the level of exposure to those pressures.

Where do cumulative effects occur in the south east marine plan area?

4. Cumulative effects can occur anywhere throughout the south east marine plan area but will be amplified in areas of high marine activity such as the Thames Estuary.

The [Marine Information System](#) should be consulted to identify local habitats and species in areas that could be at risk to cumulative effects.

When do cumulative effects occur in the south east marine plan area?

5. During the lifetime of the south east marine plan negative effects caused by proposals can accumulate and become amplified. Cumulative effects can intensify at any time of the year depending on when the project is implemented. The intensity of effects may vary seasonally depending on local currents and weather amongst other biotic or abiotic factors.
6. The species and habitats that are impacted, and the extent to which they are impacted, may vary on a temporal scale. For example, intertidal mudflats in the south east are an important feeding ground for migratory birds and worsening cumulative effects may have delayed impacts on migratory species on their arrival.

Why is information on cumulative effects important in the south east marine plan area?

7. The south east coastal habitats consist of specific areas of low lying mudflats including the Southend Flats and Chapman Sands, shallow muddy creeks and broad tracts of tidal salt marsh. The area is of international importance for bird species and large swathes of its semi-natural habitat are designated as a Special Protection Area (SPA). Furthermore, the sand and gravel seabed of the Kentish Knock contains a diversity of animals living within the sediment, including catsharks hermit crabs and small sand goby fish hunting on the sandbanks. In accordance with the [Marine Policy Statement](#) and the [25 Year Environment Plan](#) it is vital that biodiversity is maintained in order to ensure that resources are sustained in a productive state for use in future as well as achieving protection of nature for its intrinsic value.
8. There is limited knowledge and data on cumulative effects so it is important to actively collect information to establish baseline data on the subject.
9. Compared to terrestrial environments, cumulative effects are important to address as it is difficult to demonstrate that while each single proposal may result in a negligible impact, the accumulation of these individual proposals over time may constitute a major impact. Therefore, there is a need for proposals to provide information on cumulative effects in order to start producing data and sufficient evidence that may be used in an attempt to address them.
10. Singular activities analysed in isolation may have little to no impact upon marine areas. However, the cumulative pressure of multiple activities can threaten the maintenance and restoration of favourable conservation status, even if each activity is analysed on its own does not. It does not matter how small the proposal is, it may have induce a tipping point where cumulative effects become critically detrimental.
11. Cumulative effects are exaggerated in the marine area due to the lack of physical boundaries.
12. As set out in the [Marine Policy Statement](#) (2.3.1.6 and 2.3.2.1), marine plans should contribute to considering cumulative impacts, for example 'Marine plans should ... identify how the potential impacts of activities will be managed, including cumulative

effects' and 'when considering the potential benefits and adverse effects, decision-makers should also take into account any multiple and cumulative impacts of proposals, in the light of other projects and activities'.

Who is this of interest to?

13. The following government departments have decision-making and regulatory functions that will apply this policy:

- Department for Environment Food and Rural Affairs
- Department for Digital, Culture, Media and Sport
- Ministry of Housing, Communities and Local Government
- Department for Business, Energy and Industrial Strategy

14. The following authorities are responsible for decision-making in relation to this policy:

- Port and Harbour Authorities
- Marine Management Organisation
- Natural England
- Environment Agency
- Planning Inspectorate
- Local Planning Authorities
- Offshore Petroleum Regulator for Environment and Decommissioning
- Oil and Gas Authority

How should this policy be applied?

15. Proposals should identify and provide information on how the potential impacts of activities upon the environment will be managed, including cumulative effects. Close working across plan boundaries will enable the marine plan authority to take account of the cumulative effects of activities at plan boundaries. The consideration of cumulative effects alongside other evidence may enable limits or targets for the area to be determined in the plan area, if it is appropriate to do so.

16. Currently projects that meet a certain criteria or threshold for potential impact are assessed under the [Marine Works \(Environmental Impact Assessment\) Regulations 2017](#) and proposals that are likely to have a significant effect on a designated site are assessed under the [Conservation of Habitats and Species Regulations 2017](#) and the [Conservation of Offshore Marine Habitats and Species Regulations 2017](#). These statutory assessments are therefore only required for certain proposals and only assess certain habitats and species.

17. Proposals should identify and provide information on how cumulative effects, as a result of the proposed project, have impacts on neighbouring plan areas such as the [East Marine Plans](#) and the [South Marine Plans](#).

18. As proposals provide information on cumulative effects, issues may be mapped on the [Marine Information System](#) providing baseline data on cumulative effects that can be considered in future proposals.

19. Proposals that provide information on cumulative effects or attempt to address them will be supported.

20. In examining and determining applications for nationally significant infrastructure projects, examining authorities and the secretary of state for The Ministry of Housing, Communities and Local Government must have regard to this policy for nationally significant infrastructure projects that may cause cumulative effects upon the environment within and adjacent to the marine plan area.

Policy

SE-DIST-1

Proposals within the south east marine plan area and adjacent plan areas must demonstrate that they will, in order of preference: a) avoid, b) minimise, c) mitigate significant disturbance to, or displacement of, highly mobile species.

What are highly mobile species?

1. Highly mobile species are those that range over large distances and include fish, birds, marine mammals and turtles. Individuals are often part of widespread international populations and may only be present in the south east marine plan area on a seasonal basis or for part of their life cycle.
2. Highly mobile species occurring in the south east marine plan area include seabirds, fish, marine mammals and turtles. The [Natural Environment and Rural Communities Act \(S41\)](#), requires the Secretary of State to publish a list of habitats and species of principal importance for the conservation of biodiversity in England. The S41 list and features of conservation importance should be used to prioritise species when applying this policy.

What is disturbance and displacement?

3. Disturbance is when species spends extra time or energy to avoid a human activity or output. The expenditure of extra energy affects the ability of a species to survive, breed, rear or nurture young or it affects the local distribution or abundance of the species. Displacement is when the number of highly mobile species in an area is suppressed due to a human activity. Highly mobile species are displaced such that they cannot access habitats essential to their success, such as foraging areas or breeding grounds.
4. Sources of displacement and disturbance include but are not limited to the physical presence of vessels or offshore structures, lighting on offshore structures and underwater noise for example during construction activities.

Where are highly mobile species in the south east marine plan area?

5. This policy applies to the whole south east marine plan area. The south east marine plan area is seasonally home to breeding, migrating and over wintering seabirds, waders and waterfowl. [Grey and harbour seals](#) are known to occur in the south east marine plan area with harbour seals occurring throughout the marine plan area in greater numbers of the two species. [Harbour porpoises](#) are known to occur at high density in the south eastern area of the south east marine plan area during winter. Other cetacean species which may occur in the south east marine plan area include but are not limited to minke whale and white-beaked dolphin.
6. Maps of the distribution of some highly mobile species are available on the [Marine Information System](#).

When is disturbance a consideration in the south east marine plan area?

7. Seasonal and temporal variations exist which are species and project dependent. Individual projects will need to consider these temporal aspects of highly mobile species. Decision-makers will need to apply the best available evidence and the precautionary principle on a case-by-case basis.

Why are highly mobile species important to the south east marine plan area?

8. Highly mobile species are resident or regular visitors to waters of the south east marine plan area. Many highly mobile species are charismatic and bring value for tourism and recreation through wildlife watching and employment at reserves, while appropriate recreation and tourism may bring opportunities for protection of species through increased public awareness and additional funding. There are internationally important populations of breeding, migrating and overwintering seabirds, waders and waterfowl which will occur in the south east marine plan area in different densities depending on the time of year. [Grey and harbour seals](#) are known to occur in the south east marine plan area with harbour seals occurring throughout the marine plan area in greater numbers of the two species. [Harbour porpoise](#) is the most frequently occurring cetacean in the south east marine plan area with densities peaking in winter in the south eastern corner of the marine plan area.
9. Tourism and recreation is important to the economy in the south east marine plan area and are highlighted in this policy because they can exert significant disturbance, as noted in the [Marine Policy Statement](#). Tourism and recreational activities are often not subject to the same statutory regulation compared to other types of proposals as many activities can take place without having to apply for an authorisation or consent. Tourism that could interact with highly mobile species occurs throughout the south east marine plan area, including but not limited to [sailing](#), for example in Kent, and wildlife watching such as in [Essex](#). Disturbance from tourism and recreation can be particularly problematic for water birds and marine mammals. In localised areas there are also issues of collision with recreational sea users.
10. Marine development, including shipping and offshore industry is important to the south east economy and promotes investment in the region. Offshore renewable energy is an important activity in the south east marine plan area. Such

developments have the potential to disturb mobile species if not managed appropriately, for example from disturbance caused by construction, underwater noise and [lighting](#).

11. The [Conservation of Habitats and Species Regulations 2017](#) and the [Conservation of Offshore Marine Habitats and Species Regulations 2017](#) prohibit the deliberate disturbance of birds and cetaceans, particularly during periods of breeding, rearing, hibernation and migration. However, disturbance induced from tourism and recreation activities is rarely deliberate in the UK and other mechanisms are required to manage these impacts.
12. Disturbance can affect the viability of a population or habitat and continued disturbance can result in a loss of habitat or population resilience. The Joint Nature Conservation Committee has developed [advice](#) for offshore industries most likely to disturb to highly mobile species. The Oslo Paris Convention has developed a [pressure matrix](#) which details the risk to cetaceans associated with different types of pressure including but not limited to barriers to movement and underwater noise.
13. Highly mobile species in the south east marine plan area play an important role in achieving the government's vision clean, healthy, safe, productive and biologically diverse oceans and seas. Highly mobile species comprise part of the [UK programme of measures](#) to achieve 'Good Environmental Status' in UK waters under the [Marine Strategy Regulations 2010](#). The main descriptor of 'Good Environmental Status' for highly mobile species is Descriptor one: 'Biological diversity is maintained. The quality and occurrence of habitats and the distribution and abundance of species are in line with prevailing physiographic, geographic and climatic conditions'. These commitments are reinforced through the in the [UK Marine Policy Statement](#) through a commitment to 'support viable populations of representative, rare, vulnerable and valued species'.
14. The [25 year Environment Plan](#) from the Department for Environment, Food and Rural Affairs commits to achieving good environmental status in our seas while allowing marine industries to thrive.
15. The following policies in the south east marine plan area seek to reduce disturbance: SE-DIST-3, SE-DIST-4. Cumulative and in-combination effects are considered in policies SE-CE-1 and SE-CE-2. Disturbance associated with underwater noise is discussed further in SE-UWN-1 and SE-UWN-2.

Who is this of interest to?

16. This policy applies to any organisation or individual putting forward a proposal including, but not restricted to, those applying for an authorisation. A proposal can be for a new activity or a change to an existing activity that is subject to management by public authorities.
17. Public authorities must take any authorisation or enforcement decisions in accordance with this policy. Authorisation and enforcement decisions are defined under Section 58(4) of the [Marine and Coastal Access Act 2009](#).
18. Public authorities must also have regard to this policy when exercising any function capable of affecting the south east marine plan area, but which are separate from

authorisation and enforcement decisions (Section 58(3) of the [Marine and Coastal Access Act 2009](#)). Such functions include but are not limited to:

- strategic planning, including strategies which may increase disturbance of highly mobile species
- access management, including access to habitats for important life stages
- flood and erosion risk management
- fisheries management including bycatch management and reporting

How should this policy be applied?

19. Proposals must demonstrate that they will, in order of preference, avoid, minimise or mitigate adverse impacts of physical disturbance and include supporting information that is proportionate to the proposal. Proposals cannot proceed to (b) unless they have first demonstrated why they cannot meet (a) and so on.
20. Inclusion of this information does not indicate that approval of the proposal will follow by default. That will also depend on other material considerations to be taken into account by the decision-maker which may include, for example, other plans.
21. If these criteria cannot be met by a proposal, where it requires an authorisation decision, it will only be authorised if there are relevant considerations in line with the Marine and Coastal Access Act (Section 58(2)).
22. Public authorities should manage activities that require authorisation, such as energy development or aggregates dredging, through existing assessments that are required under national legislation, including but not limited to Habitats Regulations Assessments, Marine Conservation Zone Assessments and Environmental Impact Assessments. These will identify conditions that need to be placed on a licence or permit.
23. The safeguarding of human health is of primary importance for decision makers when considering consent conditions for offshore structures. The [standards](#) for marking and lighting must be adhered to for all exposed offshore structures. If extra lighting is required for safe operations on the platform, beyond the [minimum requirements](#) set out in the guidance issued by the Maritime Coastguard Agency, the decision maker must consider the effects of this on known bird populations.

Policy

SE-DIST-3

Proposals, including those that increase access to the south east marine plan area, must demonstrate that they will, in order of preference:

- a) avoid
- b) minimise
- c) mitigate adverse impacts on priority habitats.

What are priority habitats?

1. Priority habitats are those recognised as being of 'principal importance' for the conservation of biological diversity in England. To deliver commitments under the [Convention on Biological Diversity](#) and Section 41 of the [Natural Environment and Rural Communities Act](#) the UK has developed a [list of habitats and species of principle importance](#) for the conservation of biodiversity in England. The list includes [marine habitats](#) such as intertidal seagrass beds, rocky reefs, sandflats, mudflats and saltmarsh.
2. Priority habitats have been identified through additional organisations and legislation. Features of Conservation Importance, including marine habitats, are identified by the Joint Nature Conservation Committee and listed in the [Ecological Network Guidance](#). The Conservation of Habitats and Species Regulations and the Conservation of Offshore Marine Habitats and Species Regulations require protection for [Annex 1 habitats](#). The [Convention for the Protection of the North-East Atlantic](#) has developed a [list of threatened and / or declining species and habitats](#).
3. The best examples of these habitats are often protected by statutory designations and are addressed by policies SE-MPA-1, SE-MPA-2, SE-MPA-3, SE-MPA-4 and SE-MPA-5. Many of these habitats, however, are not protected. This policy applies to priority habitats that are not a designated feature of a marine protected area.

Where are priority habitats in the south east marine plan area?

4. This policy concentrates on priority habitats that are not a designated feature of a marine protected area. The Joint Nature Conservation Committee [Marine Protected Area mapper](#) is an interactive resource containing information on the marine protected areas designated in UK waters. The network of marine protected areas is

likely to change over the period of this plan and the most up to date information should be used when applying this policy.

5. The potential features to consider when applying policy SE-DIST-3 are restricted to Features of Conservation Importance identified by the Joint Nature Conservation Committee listed in the [Ecological Network Guidance, Annex 1 habitats](#), habitats and species included in the Natural Environment and Rural Communities Act [Section 41 list](#), and the Oslo/Paris Convention [List of Threatened and/or Declining Species and Habitats](#). The best available evidence with advice from the statutory nature conservation bodies for the location of these features within the south east marine plan area should be used when applying this policy.

When should this policy be applied?

6. There are limited temporal considerations when considering the location of priority habitats in the south east marine plan area. Habitats in the south east marine plan area are present year round with limited to no seasonality. Human activity in the south east marine plan area occur all year round although tourism and recreation, and associated access, peak in the summer months.
7. The seasonal and temporal variations which exist are habitat, project and activity dependent and individual projects will need to consider these. Decision-makers will need to apply the best available evidence and the precautionary principle on a case-by-case basis.

Why are priority habitats important to the south east marine plan area?

8. Priority habitats play a significant role in achieving the UK government's vision clean, healthy, safe, productive and biologically diverse oceans and seas. They are vital to functioning of ecosystems in the south east marine plan area. The change or loss of priority habitats can impact the local ecosystem and the services it provides. Sandflats and mudflats offer natural coastal protection throughout the south east inshore marine plan area whilst saltmarsh habitat absorbs carbon from the atmosphere. The rich diversity of wildlife and natural beauty of priority habitats in the south east inshore marine plan area offer inspiring places to live, work and visit. Coastal habitats are particularly vulnerable to increased human access as coastal areas can be busier than offshore areas. Habitat damage or loss can have a direct impact on protected species that rely on these areas.
9. Subtidal sands and gravels are a priority habitat which occurs throughout much of the south east marine plan area, particularly in the Thames estuary and approaches. Intertidal mudflats occur, primarily in estuaries for example in the Medway estuary. Seagrass beds also occur in the Medway and on the Essex coast, for example at Southend on Sea. There are also reef habitats, such as *Sabellaria spinulosa* reef off the coast of West Mersea.
10. Habitat protection comprises part of the [UK programme of measures](#) to achieve 'Good Environmental Status' in UK waters under the [Marine Strategy Regulations 2010](#). The main descriptor of 'Good Environmental Status' for priority habitats is Descriptor one: 'Biological diversity is maintained. The quality and occurrence of habitats and the distribution and abundance of species are in line with prevailing physiographic, geographic and climatic conditions'. These commitments are

reinforced through the in the [UK Marine Policy Statement](#) through the objective, 'healthy marine and coastal habitats occur across their natural range and are able to support strong, biodiverse biological communities and the functioning of healthy, resilient and adaptable marine ecosystems'. The [National Planning Policy Framework](#) includes commitments to 'conserving and enhancing the natural environment', including 'maintaining the character of the undeveloped coast, while improving public access to it where appropriate' (para. 170 (c)).

11. Coastal and marine habitats are vulnerable to human pressures including increased access, particularly from tourism and recreation. The Joint Nature Conservation Committee has developed a [database](#) which aims to understand the relationship between human activities and their associated pressures on the marine and coastal environment. [Pressures](#) associated with coastal and marine ecosystems include but are not limited to permanent or temporary physical loss or change in habitat.

Who is this of interest to?

12. This policy applies to any organisation or individual putting forward a proposal including, but not restricted to, those applying for an authorisation. A proposal can be for a new activity or a change to an existing activity that is subject to management by public authorities.
13. Public authorities must take any authorisation or enforcement decisions in accordance with this policy. Authorisation and enforcement decisions are defined under Section 58(4) of the [Marine and Coastal Access Act 2009](#).
14. Public authorities must also have regard to this policy when exercising any function capable of affecting the south east marine plan area, but which are separate from authorisation and enforcement decisions (Section 58(3) of the [Marine and Coastal Access Act 2009](#)). Such functions include but are not limited to:
 - strategic planning
 - land and water management
 - waste management
 - access management
 - flood and erosion risk management
 - fisheries management

How should this policy be applied?

15. Proposals that have adverse impacts on priority habitats must demonstrate that they have, in order of preference, avoided, minimised or mitigated adverse impacts. Proposals cannot proceed to (b) unless they have first demonstrated why they cannot meet (a), and so on.
16. Inclusion of this information does not indicate that approval of the proposal will follow by default. Approval will also depend on other material considerations taken into account by the decision-maker which may include, for example, other plans.
17. When assessing proposals, decision makers should consider Features of Conservation Importance listed in the [Ecological Network Guidance, Annex 1](#)

[habitats](#), habitats and species included in the Natural Environment and Rural Communities Act [Section 41 list](#), and the Oslo/Paris Convention [List of Threatened and/or Declining Species and Habitats](#).

18. Public authorities should have regard to this policy when carrying out functions capable of affecting the south east marine plan area. The Section 41 list should be used to guide public authorities in implementing their duty under the [Natural Environment and Rural Communities Act](#) (Section 41), to have regard to the conservation of biodiversity in England when carrying out their functions.

Policy

SE-ML-1

Public authorities with functions capable of releasing litter into the marine area must provide adequate provision and waste management for the prevention, re-use, recycling, recovery and disposal of waste.

What is waste?

1. [Waste](#) is defined as "...any substance or object which the holder discards or intends or is required to discard...". To dispose of waste correctly to avoid it becoming litter the [waste hierarchy](#) should be applied. Solid waste in the marine environment is commonly referred to as marine litter.
2. An increase in waste created by human use, the growing dependence upon plastics and poor waste management has led to a rise in litter in the marine environment. Supported by recent research and evidence the issue of marine litter has risen on the global platform and is being debated at many levels. Marine plans can contribute towards addressing the sources of marine litter and encouraging the removal of marine litter through collaborative efforts.

What is marine litter?

3. Marine litter is any persistent, manufactured or processed solid material discarded, disposed of or abandoned in the marine and coastal environment. Marine litter consists of items that have been made or used by people and deliberately discarded into the sea or rivers or on beaches; brought indirectly to the sea with rivers, sewage, storm water or winds; accidentally lost, including material lost at sea in bad weather (fishing gear, cargo); or deliberately left by people on beaches and shores ([United Nations Environment Programme 'Marine Litter an Analytical overview'](#)).
4. Marine litter includes processed food items and excludes seaweed, twigs or other biological debris which contribute to maintaining the local ecosystem.
5. Evidence shows that the majority of marine litter found on beaches comes from land, specifically public littering^{1,6}. Plastic is the main material of marine litter^{1,6}.

Where does marine litter occur in the south east marine plan area?

6. In general, marine litter can be found on the seabed, drifting within the water column and on coastline and beaches. Marine litter originates from both land and sea based sources, including fisheries, sewerage outflows, fly-tipping, industry, and litter^{1,2}.
7. Specific data about the distribution and sources of marine litter is improving, however is not currently sufficient to give detailed spatial information about where marine litter occurs in the south east inshore marine plan area³.
8. Limited data for the south east inshore marine plan area indicates a higher than average concentration of wet wipes and sewage related debris⁵ found along the shores of the river Thames and south east coastline, indicating sewerage outflow issues or overuse of combined sewage overflows. Approximately 47% of litter items around the Thames is from food and drink packaging indicating that littering is the main source of marine litter in the Thames^{4 5}.
9. A closer look at the data by an MSc student⁶ revealed that the beaches in the south east inshore marine plan area also capture a higher than average amount of marine litter from a fishing source, this is likely due to the high intensity of commercial fishing in the south east plan area from both the inshore fleet and vessels over 15 metres further offshore.
10. The proximity to large urban settlements and rivers undoubtedly play a role in the amount of marine litter entering the marine environment⁶.

When is the south east marine plan area impacted by marine litter?

11. Marine litter is fairly consistent in the south east marine plan area. Though as with other plan areas there seems to be a higher amount of marine litter on beaches during the autumn. This may be due to worsening weather and rough seas bringing more marine litter ashore. The high percentage of sewage related debris may be released into the Thames and south east coast after periods of heavy rain and or heavy use. Both conditions may cause for combined sewage overflows to be activated releasing untreated and often unfiltered waste into the marine environment.

⁵ Litter monitoring results Thames21 (2017) [<https://www.thames21.org.uk/thames-river-watch/litter-monitoring-results/>]

⁶ Jordi Blanch Molina (2016) Analysis of spatial and temporal trends of marine litter in England beaches and the potential influencing factors [http://teamsites/sites/MMOTeams2/ev/RefLib/planning-team-references/2016_IMEC_Blanch_J_Report.pdf]

Why is reducing marine litter important to the south east marine plan area?

12. Marine litter is unsightly and can cause harm to marine wildlife through entanglement and ingestion, and through smothering of the seabed. Litter also causes economic effects through clean-up costs to local communities, lost tourism and costs to fishermen through lost catch and damaged gear. It can also pose a hazard to seafarers through fouling of ship propellers and it can provide a pathway for non-native species to spread to new areas. Reducing litter in rivers, estuaries and at the coast will aid in the overall reduction of marine litter.
13. Plastics are the main type of litter found both on beaches and offshore, including increasing quantities of microscopic pieces of plastics resulting from degradation of larger plastic products in the sea. These may act as a vector for transferring toxic chemicals to the food chain. There is, therefore, widespread recognition that current and future measures to reduce marine and coastal litter will bring ecological, economic and social benefits ([Marine strategy part one: UK initial assessment and good environmental status](#)).
14. The [25 Year Environment Plan](#) states that 'The UK is committed to leading efforts to protect the marine environment. To tackle marine pollution, we will pursue a sustainable, international and transboundary approach that prioritises reducing global reliance on plastics, increases economically viable recycling processes, and promotes maritime practices that prevent harmful matter entering the seas'.
15. This policy supports the intent of the [Litter Strategy](#) for England. The Litter Strategy makes particular reference to marine litter and the need to work together to 'reduce the amount of litter entering the marine environment and remove litter that is already there.' [Guidance on applying the Waste Hierarchy](#) should be used to avoid waste becoming marine litter in the first place.
16. [The Marine Strategy Regulations 2010](#) are part of a set of policies to help the UK meet our aim to achieve clean, healthy, safe, productive and biologically diverse oceans and seas. The directive describes good environmental status in 11 main points which cover all the important aspects of the marine ecosystem and all the main human pressures on them. From this a programme of measures for achieving good environmental status was developed in three parts. Marine planning was recognised in the [Marine strategy part three: UK programme of measures](#) as a measure of addressing marine litter.
17. To achieve Good Environmental Status for marine litter under [Marine strategy part three: UK programme of measures](#), descriptor 10 states that 'The amount of litter, and its degradation products, on coastlines and in the marine environment are reducing over time and levels do not pose a significant risk to the coastal and marine environment, either as a result of direct mortality such as through entanglement, or by way of indirect impacts such as reduced fecundity or bioaccumulation of contaminants within food chains'. Three targets have been identified to achieve this; the most relevant is an overall reduction in the number of visible litter items within specific categories/types on coastlines ([Marine strategy part three: UK programme of measures](#)).
18. [The Marine Strategy Regulations 2010](#) do not include transitional waters (estuaries, rias and rivers) and [the Water Environment \(Water Framework Directive\) \(England](#)

[and Wales\) 2017](#) does not address the issue of marine litter. Therefore marine plans are a tool to apply a consistent approach towards addressing marine litter issues across the whole of the plan area.

19. A number of policies in the South East Marine Plan support activities that could indirectly increase the amount of litter generated (SE-INF-1, SE-TR-1, SE-EMP-1, SE-EMP-2, SE-ACC-2).
20. [Tideway](#) is a national infrastructure project in the Thames. The primary purpose of the project is to reduce sewage storm overflows into the River Thames, delivering the core benefit of improved water quality. When complete Tideway will dramatically reduce storm overflows into the Thames and reduce sewage related debris entering the marine environment.

Who is this of interest to?

- Public authorities with waste or land management functions
- Public authorities with strategic planning functions which enable activities that generate waste that could become coastal or marine litter
- Port and harbour waste management functions including waste reception facilities
- Planning Inspectorate when approving local authority waste management plans and other strategic plans that could lead to increased waste generation
- Maritime Coastguard Agency Pollution Prevention from Ships and Port Receptions Facilities Regulations functions
- Public authorities that develop River Basin Management Plans and other land management plans capable of affecting the marine area
- Water companies with waste water management functions
- Inshore Fisheries and Conservation Authorities – management of commercial fisheries for the purposes of environmental protection

How should this policy be applied?

21. SE-ML-1 applies to the whole of the south east marine plan area and extends to functions that are carried out in adjacent marine plan area which are capable of affecting the south east marine plan area.
22. Policy SE-ML-1 aligns with the [Marine Policy Statement](#) (2.5.10 - 2.5.14) and the [Marine and Coastal Access Act](#). Public authorities must have regard for this policy when exercising any function capable of affecting the south east marine plan area, but which are separate from authorisation and enforcement decisions (Section 58(3) of the [Marine and Coastal Access Act 2009](#)).
23. Reducing waste at source in accordance with [the Waste \(England and Wales\) Regulations 2011](#) would contribute towards reducing marine litter. Measures to facilitate the re-use and recycling of waste before it becomes marine litter must be implemented. [Guidance on applying the Waste Hierarchy](#) must be applied to ensure public authority functions capable of affecting the marine area include measures to avoid the introduction of litter to the marine environment. [Guidance on applying the Waste Hierarchy](#) ranks waste management options according to what is best for the

environment. It gives top priority to preventing waste in the first place. When waste is created it gives priority to preparing it for re-use, then recycling, then recovery, and last of all disposal (eg landfill). This guidance is produced under regulation 15(1) of [the Waste \(England and Wales\) Regulations 2011](#) and any person subject to the regulation 12 duty must have regard to it.

24. Avoiding littering and inappropriate disposal of waste is the best way to reduce the amount of debris getting into the environment³. Public authorities ([as defined in Section 89 \(1\) of the Environmental Protection Act 1990](#)) have a role in keeping their land free from litter which includes beaches, waterside land and public open spaces as described in the [Code of Practice on Litter and Refuse](#) under the [Environmental Protection Act 1990](#). This includes the provision of waste bins and other infrastructure (for example signage and information boards) and provides local authorities with powers to take enforcement action against littering. Public authorities must focus their efforts to support the aims of the [Litter Strategy](#) for England, by improving education, enforcement and infrastructure to reduce littering.
25. Public authorities, including local authorities and port and harbour authorities, should have regard to SE-ML-1 and SE-ML-2 when developing waste management plans or any plan which enables activities that generate waste or litter in the south east marine plan area. Such activities include development, regeneration and tourism.
26. Public authorities responsible for approving waste management plans and strategic plans that could result in an increase of marine litter or litter at the coast should also have regard to SE-ML-1 and SE-ML-2. This includes the Planning Inspectorate when approving local authority plans, and the Maritime Coastguard Agency when approving waste management plans for ports, harbours and vessels.
27. The discharge of litter into the sea is prohibited by the International Convention for the Prevention of Pollution from Ships ([MARPOL Annex V](#)) and the [Environmental Protection Act 1990](#). Ports and Harbour authorities must provide waste reception facilities adequate to meet the needs of ships normally using the harbour or terminal in question in accordance with the most up to date [Port Waste Reception Facilities Regulations](#). Ports and harbours working with local authorities and the voluntary sector could improve their waste management processes and cut costs by applying SE-ML-1 and SE-ML-2 through collaborative working.
28. Public authorities developing River Basin Management Plans, and land or waste water management plans (including water companies) that are capable of affecting the south east marine plan area must also have regard to SE-ML-1 and build in measures to avoid the introduction of litter to the marine area. Also see SE-WQ-3.
29. Inshore Fisheries and Conservation Authorities have duties under the [Marine and Coastal Access Act \(S153\)](#) to protect the marine environment from the effects of sea fisheries and seek to ensure the conservation objectives of any Marine Conservation Zones are furthered in their district and should therefore have regard to SE-ML-1 when carrying out these functions.
SE-ML-1 applies to the whole of the south east marine plan area and extends to functions that are carried out in adjacent marine plan areas which are capable of affecting the south east marine plan area.

30. Policy SE-ML-1 aligns with the [Marine Policy Statement](#) (2.5.10 - 2.5.14) and the [Marine and Coastal Access Act](#). Public authorities must have regard for this policy when exercising any function capable of affecting the south east marine plan area, but which are separate from authorisation and enforcement decisions (Section 58(3) of the [Marine and Coastal Access Act 2009](#)).
31. Reducing waste at source in accordance with [the Waste \(England and Wales\) Regulations 2011](#) would contribute towards reducing marine litter. Measures to facilitate the re-use and recycling of waste before it becomes marine litter must be implemented. [Guidance on applying the Waste Hierarchy](#) must be applied to ensure public authority functions capable of affecting the marine area include measures to avoid the introduction of litter to the marine environment. [Guidance on applying the Waste Hierarchy](#) ranks waste management options according to what is best for the environment. It gives top priority to preventing waste in the first place. When waste is created it gives priority to preparing it for re-use, then recycling, then recovery, and last of all disposal (eg landfill). This guidance is produced under regulation 15(1) of [the Waste \(England and Wales\) Regulations 2011](#) and any person subject to the regulation 12 duty must have regard to it.
32. Avoiding littering and inappropriate disposal of waste is the best way to reduce the amount of debris getting into the environment³. Public authorities ([as defined in Section 89 \(1\) of the Environmental Protection Act 1990](#)) have a role in keeping their land free from litter which includes beaches, waterside land and public open spaces as described in the [Code of Practice on Litter and Refuse](#) under the [Environmental Protection Act 1990](#). This includes the provision of waste bins and other infrastructure (for example signage and information boards) and provides local authorities with powers to take enforcement action against littering. Public authorities must focus their efforts to support the aims of the [Litter Strategy](#) for England, by improving education, enforcement and infrastructure to reduce littering.
33. Public authorities, including local authorities and port and harbour authorities, should have regard to SE-ML-1 and SE-ML-2 when developing waste management plans or any plan which enables activities that generate waste or litter in the south east marine plan area. Such activities include development, regeneration and tourism.
34. Public authorities responsible for approving waste management plans and strategic plans that could result in an increase of marine litter or litter at the coast should also have regard to SE-ML-1 and SE-ML-2. This includes the Planning Inspectorate when approving local authority plans, and the Maritime Coastguard Agency when approving waste management plans for ports, harbours and vessels.
35. The discharge of litter into the sea is prohibited by the International Convention for the Prevention of Pollution from Ships ([MARPOL Annex V](#)) and the [Environmental Protection Act 1990](#). Ports and Harbour authorities must provide waste reception facilities adequate to meet the needs of ships normally using the harbour or terminal in question in accordance with the most up to date [Port Waste Reception Facilities Regulations](#). Ports and harbours working with local authorities and the voluntary sector could improve their waste management processes and cut costs by applying SE-ML-1 and SE-ML-2 through collaborative working.
36. Public authorities developing River Basin Management Plans, and land or waste water management plans (including water companies) that are capable of affecting

the south east marine plan area must also have regard to SE-ML-1 and build in measures to avoid the introduction of litter to the marine area. Also see SE-WQ-3.

37. Inshore Fisheries and Conservation Authorities have duties under the [Marine and Coastal Access Act \(S153\)](#) to protect the marine environment from the effects of sea fisheries and seek to ensure the conservation objectives of any Marine Conservation Zones are furthered in their district and should therefore have regard to SE-ML-1 when carrying out these functions.

Public authorities with waste management functions capable of affecting the marine area must provide adequate provision for the prevention and removal of marine litter.

What is waste?

1. [Waste](#) is defined as "...any substance or object which the holder discards or intends or is required to discard...". To dispose of waste correctly to avoid it becoming litter the [waste hierarchy](#) should be applied. Solid waste in the marine environment is commonly referred to as marine litter.
2. An increase in waste created by human use, the growing dependence upon plastics and poor waste management has led to a rise in litter in the marine environment. Supported by recent research and evidence the issue of marine litter has risen on the global platform and is being debated at many levels. Marine plans can contribute towards addressing the sources of marine litter and encouraging the removal of marine litter through collaborative efforts.

What is marine litter?

3. Marine litter is any persistent, manufactured or processed solid material discarded, disposed of or abandoned in the marine and coastal environment. Marine litter consists of items that have been made or used by people and deliberately discarded into the sea or rivers or on beaches; brought indirectly to the sea with rivers, sewage, storm water or winds; accidentally lost, including material lost at sea in bad weather (fishing gear, cargo); or deliberately left by people on beaches and shores ([United Nations Environment Programme 'Marine Litter an Analytical overview'](#)).
4. Marine litter includes processed food items and excludes seaweed, twigs or other biological debris which contribute to maintaining the local ecosystem.
5. Evidence shows that the majority of marine litter found on beaches comes from land, specifically public littering^{1,6}. Plastic is the main material of beach litter items^{1,6}.

Where does marine litter occur in the south east marine plan area?

6. In general, marine litter can be found on the seabed, drifting within the water column and on coastline and beaches. Marine litter originates from both land and sea based sources, including fisheries, sewerage outflows, fly-tipping, industry, and litter^{1,2}.
7. Specific data about the distribution and sources of marine litter is improving, however is not currently sufficient to give detailed spatial information about where marine litter occurs in the south east inshore marine plan area³.
8. Limited data for the south east inshore marine plan area indicates a higher than average concentration of wet wipes and sewage related debris⁵ found along the shores of the river Thames and south east coastline, indicating sewerage outflow issues or overuse of storm overflows. Approximately 47% of litter items around the Thames is from food and drink packaging indicating that littering is the main source of marine litter in the Thames^{4 5}.
9. A closer look at the data⁶ revealed that the beaches in the south east inshore marine plan area also capture a higher than average amount of marine litter from a fishing source, this is likely due to the high intensity of commercial fishing in the south east plan area from both the inshore fleet and vessels over 15 metres further offshore.
10. The proximity to large urban settlements and rivers undoubtedly play a role in the amount of marine litter entering the marine environment⁶.

When is the south east marine plan area impacted by marine litter?

11. Marine litter is fairly consistent in the south east marine plan area. Though as with other plan areas there seems to be a higher amount of marine litter on beaches during the autumn. This may be due to worsening weather and rough seas bringing more marine litter ashore. The high percentage of sewage related debris may be released into the Thames and south east coast after periods of heavy rain and or heavy use. Both conditions may cause for storm overflows to be activated releasing untreated and often unfiltered waste into the marine environment.

Why is reducing marine litter important to the south east marine plan area?

12. Marine litter is unsightly and can cause harm to marine wildlife through entanglement and ingestion, and through smothering of the seabed. Litter also causes economic effects through clean-up costs to local communities, lost tourism and costs to fishermen through lost catch and damaged gear. It can also pose a hazard to seafarers through fouling of ship propellers and it can provide a pathway for non-native species to spread to new areas. Reducing litter in rivers, estuaries and at the coast will aid in the overall reduction of marine litter.
13. Plastics are the main type of litter found both on beaches and offshore, including increasing quantities of microscopic pieces of plastics resulting from degradation of larger plastic products in the sea. These may act as a vector for transferring toxic chemicals to the food chain. There is, therefore, widespread recognition that current and future measures to reduce marine and coastal litter will bring ecological, economic and social benefits ([Marine strategy part one: UK initial assessment and good environmental status](#)).
14. The [25 Year Environment Plan](#) states that 'The UK is committed to leading efforts to protect the marine environment. To tackle marine pollution, we will pursue a sustainable, international and transboundary approach that prioritises reducing global reliance on plastics, increases economically viable recycling processes, and promotes maritime practices that prevent harmful matter entering the seas'.
15. This policy supports the intent of the [Litter Strategy](#) for England. The Litter Strategy makes particular reference to marine litter and the need to work together to 'reduce the amount of litter entering the marine environment and remove litter that is already there.' [Guidance on applying the Waste Hierarchy](#) should be used to avoid waste becoming marine litter in the first place.
16. [The Marine Strategy Regulations 2010](#) are part of a set of policies to help the UK meet our aim to achieve clean, healthy, safe, productive and biologically diverse oceans and seas. The directive describes good environmental status in 11 main points which cover all the important aspects of the marine ecosystem and all the main human pressures on them. From this a programme of measures for achieving good environmental status was developed in three parts. Marine planning was recognised in the [Marine strategy part three: UK programme of measures](#) as a measure of addressing marine litter.
17. To achieve Good Environmental Status for marine litter under [Marine strategy part three: UK programme of measures](#), descriptor 10 states that 'The amount of litter, and its degradation products, on coastlines and in the marine environment are reducing over time and levels do not pose a significant risk to the coastal and marine environment, either as a result of direct mortality such as through entanglement, or by way of indirect impacts such as reduced fecundity or bioaccumulation of contaminants within food chains'. Three targets have been identified to achieve this; the most relevant is an overall reduction in the number of visible litter items within specific categories/types on coastlines ([Marine strategy part three: UK programme of measures](#)).
18. [The Marine Strategy Regulations 2010](#) do not include transitional waters (estuaries, rias and rivers) and [the Water Environment \(Water Framework Directive\) \(England](#)

[and Wales\) 2017](#) does not address the issue of marine litter. Therefore marine plans are a tool to apply a consistent approach towards addressing marine litter issues across the whole of the plan area.

19. A number of policies in the South East Marine Plan support activities that could indirectly increase the amount of litter generated (SE-INF-1, SE-TR-1, SE-EMP-1, SE-EMP-2, SE-ACC-2).

Who is this of interest to?

- Public authorities with land management functions ([as defined in Section 89 \(1\) of the Environmental Protection Act 1990](#))
- Public authorities with waste management functions
- Port and harbour waste management functions including waste reception facilities
- Planning Inspectorate when approving local authority waste management plans and other strategic plans that could lead to increased waste generation
- Maritime Coastguard Agency Pollution Prevention from Ships and Port Receptions Facilities Regulations functions
- Public authorities that develop River Basin Management Plans and other land management plans capable of affecting the marine area
- Water companies with waste water management functions
- Marine Management Organisation – Issues licences for the removal of abandoned, lost and discarded fishing gear
- Inshore Fisheries and Conservation Authorities – management of commercial fisheries for the purposes of environmental protection

How should this policy be applied?

20. SE-ML-1 applies to the whole of the south east marine plan area.
21. Policy SE-ML-1 aligns with the Marine Policy Statement (2.5.10 - 2.5.14) and the [Marine and Coastal Access Act](#). Public authorities must have regard for this policy when exercising any function capable of affecting the south east marine plan area, but which are separate from authorisation and enforcement decisions (Section 58(3) of the [Marine and Coastal Access Act 2009](#)).
22. Avoiding littering and inappropriate disposal of waste is the best way to reduce the amount of debris getting into the environment³ - see SE-ML-1. Removal of marine litter requires a collaborative approach between responsible public authorities and the voluntary sector.
23. Public authorities ([as defined in Section 89 \(1\) of the Environmental Protection Act 1990](#)) have a role in keeping their land free from litter which includes beaches, waterside land and public open spaces as described in the [Code of Practice on Litter and Refuse](#). This includes the provision of waste bins and other infrastructure (for example signage and information boards) and provides local authorities with powers to take enforcement action against littering. Public authorities must focus their efforts to support the aims of the [Litter Strategy](#) for England, by improving education, enforcement and infrastructure to reduce littering.

24. A minimum requirement of the [Environmental Protection Act 1990](#) states that amenity beaches identified by local authorities should be kept clear of all types of litter and refuse between 1 May and 30 September inclusive. Due to the warming climate beaches are increasingly being used outside of the traditional bathing season between May and September. It is recommended as good practice that authorities are aware of the different nature of beaches within their area that they carry out a regular monitoring programme of those beaches and develop an appropriate cleansing regime. Through collaborative working with the voluntary sector, public authorities should aim to increase the litter removal provision for non-amenity beaches as required.
25. Collaborative working covers a variety of ways that two or more organisations can work together. Collaborative working between charities, local organisations and public authorities can play an important role in helping to encourage reduction, re-use and recycling initiatives and to remove marine litter. Groups such as [Fishing for Litter](#) and [Dive Against Debris](#) remove litter underwater and schemes such as [Odyssey Innovation](#) in the south west re-use and recycle marine litter once collected. Public authorities play a key role in facilitating collaboration at a local level and advising other groups on best practice.
26. Ports and Harbour authorities must provide waste reception facilities adequate to meet the needs of ships normally using the harbour or terminal in question in accordance with the most recent [Port Waste Reception Facilities Regulations](#). Ports and harbour authorities should also support efforts where appropriate to remove marine litter from within their defined harbour limit. By working with local authorities and the voluntary sector Port and Harbour Authorities could improve their waste management processes and cut costs through applying SE-ML-1 by working collaboratively.
27. Other Public Authorities capable of affecting the marine area must demonstrate collaborative working to address the issue of marine litter either but not exclusively through:
- providing infrastructure to reduce marine litter
 - supporting efforts to remove marine litter
 - improving education on marine litter
 - support enforcement action against littering
 - supporting the re-use or recycling of marine litter
28. SE-ML-2 applies to the whole of the south east marine plan area and extends to functions that are carried out in adjacent marine plan area which are capable of affecting the south east marine plan area.
29. Policy SE-ML-2 aligns with the [Marine Policy Statement](#) (2.5.10 - 2.5.14) and the [Marine and Coastal Access Act](#). Public authorities must have regard for this policy when exercising any function capable of affecting the south east marine plan area, but which are separate from authorisation and enforcement decisions (Section 58(3) of the [Marine and Coastal Access Act 2009](#)).
30. Avoiding littering and inappropriate disposal of waste is the best way to reduce the amount of debris getting into the environment³ - see SE-ML-1. Removal of marine

litter requires a collaborative approach between responsible public authorities and the voluntary sector.

31. Public authorities ([as defined in Section 89 \(1\) of the Environmental Protection Act 1990](#)) have a role in keeping their land free from litter which includes beaches, waterside land and public open spaces as described in the [Code of Practice on Litter and Refuse](#). This includes the provision of waste bins and other infrastructure (for example signage and information boards) and provides local authorities with powers to take enforcement action against littering. Public authorities must focus their efforts to support the aims of the [Litter Strategy](#) for England, by improving education, enforcement and infrastructure to reduce littering.
32. A minimum requirement of the [Environmental Protection Act 1990](#) states that amenity beaches identified by local authorities should be kept clear of all types of litter and refuse between 1 May and 30 September inclusive. Due to the warming climate beaches are increasingly being used outside of the traditional bathing season between May and September. It is recommended as good practice that authorities are aware of the different nature of beaches within their area that they carry out a regular monitoring programme of those beaches and develop an appropriate cleansing regime. Through collaborative working with the voluntary sector, public authorities should aim to increase the litter removal provision for non-amenity beaches as required.
33. Collaborative working covers a variety of ways that two or more organisations can work together. Collaborative working between charities, local organisations and public authorities can play an important role in helping to encourage re-use and recycling initiatives and to remove marine litter. Groups such as the [Thames Litter Forum](#) and [Thames21](#) are examples of collaborative groups working to address marine litter. Regional collaborative campaigns such as [#OneLess](#) and For Fish's Sake ([#FFSLDN](#)) have had some success in influencing a behaviour change reducing litter through education. Public authorities play a key role in facilitating collaboration at a local level and advising other groups on best practice.
34. In accordance with the most recent [Port Waste Reception Facilities Regulations](#), Ports and Harbour authorities must provide waste reception facilities adequate to meet the needs of ships normally using the harbour or terminal in question. Ports and harbour authorities should also support efforts where appropriate to remove marine litter from within their defined harbour limit. Through applying SE-ML-2 by working collaboratively with local authorities and the voluntary sector Port and Harbour Authorities could improve their waste management processes and cut costs.
35. Other Public Authorities capable of affecting the marine area must demonstrate collaborative working to address the issue of marine litter either but not exclusively through:
 - providing infrastructure to reduce marine litter
 - supporting efforts to remove marine litter
 - improving education on marine litter
 - support enforcement action against littering
 - supporting the re-use or recycling of marine litter

Policy drafting template SE-ML-3

HLMO	Living within environmental limits	Sub bullet(s)	Biodiversity is protected, conserved and where appropriate recovered and loss has been halted.
Grouping	Litter	Code	SE-ML-3

Policy

SE-ML-3

Proposals demonstrating a reduction in waste, re-use or recycling of marine litter will be supported.

Proposals that could potentially increase the amount of marine litter that is discharged into the marine area, either intentionally or accidentally, must include measures to:

- a) avoid
- b) minimise or
- c) mitigate the discharges

What is waste?

1. [Waste](#) is defined as "...any substance or object which the holder discards or intends or is required to discard...". To dispose of waste correctly to avoid it becoming litter the [waste hierarchy](#) should be applied.
2. An increase in waste created by human use, the growing dependence upon plastics and poor waste management has led to a rise in litter in the marine environment. Supported by recent research and evidence the issue of marine litter has risen on the global platform and is being debated at many levels. Marine plans can contribute towards addressing the sources of marine litter and encouraging the removal of marine litter through collaborative efforts.

What is marine litter?

3. Marine litter is any persistent, manufactured or processed solid material discarded, disposed of or abandoned in the marine and coastal environment. Marine litter consists of items that have been made or used by people and deliberately discarded into the sea or rivers or on beaches; brought indirectly to the sea with rivers, sewage, storm water or winds; accidentally lost, including material lost at sea in bad weather (fishing gear, cargo); or deliberately left by people on beaches and shores ([United Nations Environment Programme 'Marine Litter an Analytical overview'](#)).
4. Marine litter includes processed food items and excludes seaweed, twigs or other biological debris which contribute to maintaining the local ecosystem.
5. Evidence shows that the majority of marine litter found on beaches comes from land, specifically public littering^{1,6}. Plastic is the main material of beach litter items^{1,6}.

Where does marine litter occur in the south east marine plan area?

6. In general, marine litter can be found on the seabed, drifting within the water column and on coastline and beaches. Marine litter originates from both land and sea based sources, including fisheries, sewerage outflows, fly-tipping, industry, and litter^{1,2}.
7. Specific data about the distribution and sources of marine litter is improving, however is not currently sufficient to give detailed spatial information about where marine litter occurs in the south east inshore marine plan area³.
8. Limited data for the south east inshore marine plan area indicates a higher than average concentration of wet wipes and sewage related debris⁵ found along the shores of the river Thames and south east coastline, indicating sewerage outflow issues or overuse of storm overflows. Approximately 47% of litter items around the Thames is from food and drink packaging indicating that littering is the main source of marine litter in the Thames^{4 5}.
9. A closer look at the data by an MSc student⁶ revealed that the beaches in the south east inshore marine plan area also capture a higher than average amount of marine litter from a fishing source, this is likely due to the high intensity of commercial fishing in the south east plan area from both the inshore fleet and vessels over 15 metres further offshore.
10. The proximity to large urban settlements and rivers undoubtedly play a role in the amount of marine litter entering the marine environment⁶.

When is the south east marine plan area impacted by marine litter?

11. Marine litter is fairly consistent in the south east marine plan area. Though as with other plan areas there seems to be a higher amount of marine litter on beaches during the autumn. This may be due to worsening weather and rough seas bringing more marine litter ashore at this time of year. The high percentage of sewage related debris may be released into the Thames and south east coast after periods of heavy rain and or heavy use. Both conditions may cause for combined sewage overflows to be activated releasing untreated and often unfiltered waste into the marine environment.

⁶ Jordi Blanch Molina (2016) Analysis of spatial and temporal trends of marine litter in England beaches and the potential influencing factors [http://teamsites/sites/MMOTeams2/ev/RefLib/planning-team-references/2016_IMEC_Blanch_J_Report.pdf]

Why is reducing marine litter important to the south east marine plan area?

12. Marine litter is unsightly and can cause harm to marine wildlife through entanglement and ingestion, and through smothering of the seabed. Litter also causes economic effects through clean-up costs to local communities, lost tourism and costs to fishermen through lost catch and damaged gear. It can also pose a hazard to seafarers through fouling of ship propellers and it can provide a pathway for non-native species to spread to new areas. Reducing litter in rivers, estuaries and at the coast will aid in the overall reduction of marine litter.
13. Plastics are the main type of litter found both on beaches and offshore, including increasing quantities of microscopic pieces of plastics resulting from degradation of larger plastic products in the sea. These may act as a vector for transferring toxic chemicals to the food chain. There is, therefore, widespread recognition that current and future measures to reduce marine and coastal litter will bring ecological, economic and social benefits ([Marine strategy part one: UK initial assessment and good environmental status](#)).
14. The [25 Year Environment Plan](#) states that 'The UK is committed to leading efforts to protect the marine environment. To tackle marine pollution, we will pursue a sustainable, international and transboundary approach that prioritises reducing global reliance on plastics, increases economically viable recycling processes, and promotes maritime practices that prevent harmful matter entering the seas'.
15. This policy supports the intent of the [Litter Strategy](#) for England. The Litter Strategy makes particular reference to marine litter and the need to work together to 'reduce the amount of litter entering the marine environment and remove litter that is already there.' [Guidance on applying the Waste Hierarchy](#) should be used to avoid waste becoming marine litter in the first place.
16. [The Marine Strategy Regulations 2010](#) are part of a set of policies to help the UK meet our aim to achieve clean, healthy, safe, productive and biologically diverse oceans and seas. The directive describes good environmental status in 11 main points which cover all the important aspects of the marine ecosystem and all the main human pressures on them. From this a programme of measures for achieving good environmental status was developed in three parts. Marine planning was recognised in the [Marine strategy part three: UK programme of measures](#) as a measure of addressing marine litter.
17. To achieve Good Environmental Status for marine litter under [Marine strategy part three: UK programme of measures](#), descriptor 10 states that 'The amount of litter, and its degradation products, on coastlines and in the marine environment are reducing over time and levels do not pose a significant risk to the coastal and marine environment, either as a result of direct mortality such as through entanglement, or by way of indirect impacts such as reduced fecundity or bioaccumulation of contaminants within food chains'. Three targets have been identified to achieve this; the most relevant is an overall reduction in the number of visible litter items within specific categories/types on coastlines ([Marine strategy part three: UK programme of measures](#)).
18. [The Marine Strategy Regulations 2010](#) do not include transitional waters (estuaries, rias and rivers) and [the Water Environment \(Water Framework Directive\) \(England](#)

[and Wales\) 2017](#) does not address the issue of marine litter. Therefore marine plans are a tool to apply a consistent approach towards addressing marine litter issues across the whole of the plan area.

Who is this of interest to?

19. Anyone making a proposal that could potentially increase the amount of marine litter that enters the south east marine plan area.
20. Public authorities making any authorisation for proposals that are capable of introducing, managing or preventing the introduction of litter into the south east marine plan area must make their decision in accordance with SE-ML-3.
21. Including decision-making public authorities such as:
 - Local planning authorities
 - Marine licensing authorities
 - Ports and Harbour authorities
 - The Planning Inspectorate
 - The Crown Estate
 - Inshore Fisheries and Conservation Authorities
 - Maritime and Coastguard Agency

How should this policy be applied?

22. SE-ML-3 applies to the whole of the south east marine plan area.
23. Decision-makers should support proposals that seek to reduce marine litter through preventative or litter removal measures, where they comply with other policies in the South East Marine Plan.
24. Proposals should demonstrate they have considered the potential for the introduction of litter. Proposals should demonstrate that they will, in order of preference, avoid, minimise or mitigate marine litter - proposals cannot proceed to (b) unless they have first demonstrated why they cannot meet (a) etc. Proposals should demonstrate how they will avoid, minimise, or where this is not possible, mitigate direct and indirect introductions of litter to the marine area during both the construction period and throughout the lifetime of the proposal.
25. The current regulatory regime includes provisions for reducing and removing litter including:
 - [Environmental Protection Act 1990](#)
 - [Code of Practice on Litter and Refuse](#)
 - [The Waste \(England and Wales\) Regulations 2011](#)
 - [National Planning Policy for Waste](#)
 - [National Planning Policy Framework](#)
 - [National Waste Management Plan for England](#)
26. In addition, licensing requirements for marine related activities are required, where relevant, to put in place a waste management plan, which includes measures to minimise the risk of litter escape.

27. Measures could include:

- avoid – avoiding the direct or indirect discharge of any items of marine litter during development and once operational via methods outlined in a thorough waste management plan
- minimise – developers will monitor and remove any items of marine litter from the development and other sources in the area surrounding the development, during development and once operational outlined in a thorough waste management plan
- mitigate - developers will monitor and remove any items of marine litter from the development or other sources in the area surrounding the development as well as; once operational support a re-use or recycling scheme for marine litter or extend their clean-up operation further into the surrounding area to leave the marine area cleaner than before their development eg adopt sea bins or financially support coastal clean-up operations – all of which can be outlined in a thorough waste management plan

28. Proposals should include an explanation or evidence of a plan to manage waste during construction and once operational. Licensed marine activities will need to demonstrate consideration of the [The Waste \(England and Wales\) Regulations 2011](#) and its [Waste Hierarchy](#).

29. [Guidance on applying the Waste Hierarchy](#) must be applied to ensure developments capable of affecting the marine area include measures to avoid the introduction of marine litter. [Guidance on applying the Waste Hierarchy](#) ranks waste management options according to what is best for the environment. It gives top priority to preventing waste in the first place. When waste is created it gives priority to preparing it for re-use, then recycling, then recovery, and last of all disposal (eg landfill). Measures to facilitate the re-use and recycling of waste before it becomes marine and coastal litter and also once removed from the marine and coastal area should be implemented where appropriate.

Policy

SE-MPA-1

Proposals that support the objectives of marine protected areas and the ecological coherence of the marine protected area network will be supported.

Proposals that may have adverse impacts on the objectives of marine protected areas must demonstrate that they will, in order of preference:

- a) avoid,
- b) minimise,
- c) mitigate adverse impacts, with due regard given to statutory advice on an ecologically coherent network.

What are marine protected areas?

1. Marine protected areas are areas of the sea protected by law for nature conservation purposes. They protect geological features and habitats and species on the sea bed, in the water column, on the sea surface or in the air above.
2. Marine protected areas in the south east marine plan area include:
 - Ramsar Sites – wetlands of international importance
 - Special Protection Areas (including proposed sites) – rare, vulnerable or threatened birds
 - Special Areas of Conservation (including candidate sites and Sites of Community Importance) – habitats and species in need of conservation
 - Marine Conservation Zones (including recommended sites) – geological features, habitats and species typical of UK waters
 - Sites of Special Scientific Interest – geological features, flora and fauna of special interest
3. Ramsar Sites, Special Protection Areas and Special Areas of Conservation are designated and protected under the [Conservation of Habitats and Species Regulations 2017](#) and the [Conservation of Offshore Marine Habitats and Species Regulations 2017](#). Marine Conservation Zones are designated and protected under the [Marine and Coastal Access Act 2009](#). Sites of Special Scientific Interest are designated and protected under the [Wildlife and Countryside Act 1981](#) and the [Countryside and Rights of Way Act 2000](#).
4. For Special Protection Areas and Special Areas of Conservation, areas outside the designated area that are important to features for which a site has been designated are also protected.

What is an ecologically coherent network?

5. The designations listed above form the English contribution towards a wider ecologically coherent network of marine protected areas in the North East Atlantic. They form the government's contribution to commitments under the [Convention for the Protection of the Marine Environment of the North East Atlantic](#). The UK principles of ecological coherence are laid out in the [Joint Administration Statement](#) and are based on [guidance](#) produced by the Commission for the [Convention for the Protection of the Marine Environment of the North East Atlantic](#). An ecologically coherent network includes well managed, resilient, and adequately sized marine protected areas that are ecologically connected and which represent a range of replicated marine habitats and species.

Where are the marine protected areas in the south east marine plan area?

6. The Joint Nature Conservation Committee [Marine Protected Area mapper](#) is an interactive resource containing information on the marine protected areas designated in UK waters. The network of marine protected areas is likely to change over the period of this plan and the most up to date information should be used when applying this policy.
7. The coastline of the south east inshore marine plan area is protected by numerous Marine Conservation Zones for a wide variety of marine habitats and species. The Thanet Coast Marine Conservation Zone is designated for the longest area of continuous subtidal chalk seabed in the UK and is the only site to protect the Stalked Jellyfish (*Lucernariopsis cruxmelitensis*). Other sites protect important species such as the tentacle lagoon worm (*Alkmaria romijni*) and the native oyster (*Ostrea edulis*).
8. *HOLDING PLACE - Tranche 3 MCZs will also need to be acknowledged when we have more certainty about which sites to include. Awaiting designation outcome in June 2019.*
9. Large areas of the south east marine plan area are designated as Special Protection Areas because they contain habitats that support internationally significant populations of seabirds and waterfowl. The Outer Thames Estuary Special Protection Area covers approximately one third of the plan areas and is designated for red-throated diver, little tern and common tern. The Thames Estuary and Marshes and The Swale Special Protection Areas are designated for large waterfowl assemblages, and breeding bird and waterfowl assemblage respectively. Special Areas of Conservation in the plan areas protect habitats such as sand banks, sandflats, mudflats and estuaries. The Southern North Sea Candidate Special Area of Conservation is the largest site in the UK solely for the protection of harbour porpoise.
10. Many of the marine protected areas extend into the south and east marine plan area and are also adjacent to French waters.
11. Mobile species designated as a feature of special protection areas and special areas of conservation are also protected when they are outside the boundary of their site. Seabird and seal density maps are available on the [Marine Information System](#). The evidence base for mobile marine species is continuously developing. The most up to date information and conservation advice should be used when applying this policy.

12. The boundaries of marine protected areas in the south east marine plan area may change in the future in response to natural range shifts caused by climate change, and additional marine protected areas may be designated. Policy SE-MPA-1 will apply to new and amended areas as they develop.

When should this policy be applied?

13. SE-MPA-1 applies year round and throughout the lifetime of the South East Marine Plan. Marine protected areas are a static designation but the features of an individual site may be more sensitive to pressures at specific times. Geological features and habitats are generally present year round with limited to no seasonality. Mobile species, such as birds, seals and cetaceans, follow predictable seasonal patterns.
14. The most up to date information and conservation advice should be used when applying this policy to determine temporal considerations. Natural England produces conservation advice packages for inshore marine protected areas within 12nm through the [Designated Sites View](#). The Joint Nature Conservation Committee produces conservation advice packages for marine protected areas between 12-200nm through the [Site Information Centres](#). The packages include statutory advice on the qualifying features of a site and their conservation objectives, including advice on the seasonality of mobile features. They advise how to further the conservation objectives, and they identify activities that are capable of affecting the qualifying features and the processes they depend upon.

Why are marine protected areas important to the south east marine plan area?

15. Marine protected areas in the south east marine plan area are an important tool for protecting biodiversity, ecosystem services and natural capital assets, and to prevent habitat loss. They benefit rare, vulnerable and threatened habitats and species, as well as those typical to UK waters. They support the local economy, provide opportunities for research, health and well-being, and provide inspirational places to live, work and visit.
16. As stated in the [Joint Administration Statement](#), linking the marine protected areas in the south east marine plan area 'together in an ecologically coherent network, supported by wider environmental management measures will achieve benefits more effectively than individual marine protected areas can alone.'
17. The marine protected areas in the south east marine plan area play a significant role in achieving the UK government's vision for clean, healthy, safe, productive and biologically diverse oceans and seas. They contribute to targets in the [United Nations Convention on Biological Diversity](#) to protect 10% of the world's coastal and marine areas by 2020, and are part of the [UK programme of measures](#) to achieve Good Environmental Status in UK waters under the [Marine Strategy Regulations 2010](#). These commitments are reinforced in the [UK Marine Policy Statement](#) through a commitment to 'complete an ecologically coherent network as part of a broad based approach to nature conservation' (3.1.2). The [National Planning Policy Framework](#) includes commitments to enhance the natural environment by 'minimising impacts on and providing net gains for biodiversity, including by establishing coherent ecological networks that are more resilient to current and

future pressures' (para.170(d)). The [25 Year Environment Plan](#) from the Department for Environment, Food and Rural Affairs commits to increasing the proportion of protected and well-managed seas, and better management of existing protected sites.

Who is this of interest to?

18. This policy applies to any organisation or individual putting forward a proposal including, but not restricted to, those applying for an authorisation. A proposal can be for a new activity or a change to an existing activity that is subject to management by public authorities.
19. Public authorities must take any authorisation or enforcement decisions in accordance with this policy. Authorisation and enforcement decisions are defined under Section 58(4) of the [Marine and Coastal Access Act 2009](#).
20. Public authorities must also have regard to this policy when exercising any function capable of affecting the south east marine plan area, but which are separate from authorisation and enforcement decisions (Section 58(3) of the [Marine and Coastal Access Act 2009](#)). Such functions include but are not limited to:
 - strategic planning
 - land and water management
 - waste management
 - access management
 - flood and erosion risk management
 - fisheries management

How should this policy be applied?

21. This policy applies to individual marine protected areas throughout the south east marine plan area, and areas outside marine protected areas that are important to features for which a marine protected area has been designated.
22. Public authorities will support proposals that support the conservation objectives of a marine protected areas and the ecological coherence of the network where it complies with other policies in this plan and other relevant legislation.
23. Public authorities will assess if the proposal affects the ecological coherence of the network on a case-by-case basis. Decision-makers should seek advice on how to consider the ecological coherence of the marine protected area network in decision-making from the statutory nature conservation bodies. Where advice states that it is not possible to assess the impact there will be no further requirements for decision-makers to consider the network. Current guidance provides advice on how marine protected areas are considered in the decision-making process. The requirements on how to consider impacts on the ecological coherence of the marine protected network under policy SE-MPA-1 may change if new guidance is issued. New and evolving advice will not be applied retrospectively to activities that have already been consented.

24. Proposals that support the objectives of marine protected areas should include information demonstrating how this will be achieved. The conservation objectives for individual sites are provided by the statutory nature conservation bodies through the [Designated Sites View](#) for sites within 12nm and through the [Site Information Centres](#) for sites between 12-200nm. The conservation objectives describe whether the condition of features for which the site is designated should be maintained or restored. Where positive impacts are identified, proposals must also assess adverse impacts in line with relevant legislation. Enhancement is not a substitute for avoidance, protection or mitigation measures.
25. Proposals must still comply with requirements under relevant legislation including the [Conservation of Habitats and Species Regulations 2017](#), the [Conservation of Offshore Marine Habitats and Species Regulations 2017](#), the [Marine and Coastal Access Act 2009](#), the [Wildlife and Countryside Act 1981](#), the [Countryside and Rights of Way Act 2000](#), the [Town and Country Planning \(Environmental Impact Assessment\) Regulations 2017](#), and other national legislation.
26. Proposals that have adverse impacts on the objectives of marine protected areas must demonstrate that they have, in order of preference, avoided, minimised or mitigated adverse impacts on individual sites in accordance with statutory monitoring requirements, such as [Habitats Regulations Assessment](#), [Marine Conservation Zone Assessment](#), [Sites of Special Scientific Interest Assessment](#), and the conservation objectives set out by the statutory nature conservation bodies. Proposals cannot proceed to (b) unless they have first demonstrated why they cannot meet (a), and so on.
27. Inclusion of this information does not indicate that approval of the proposal will follow by default. Approval will also depend on other material considerations taken into account by the decision-maker which may include, for example, other plans.
28. Where proposals cannot avoid, minimise or mitigate adverse impact but are in the public interest, they must state the case for proceeding with details of how measures of equal environmental benefit will be achieved. Guidance on mitigating impacts, what to consider in decisions on whether the public benefit of a proposal outweighs damage to the environment, and applying a risk-based approach to measures of equivalent environmental benefit is available in [Guidance on the duties on public authorities in relation to Marine Conservation Zones \(Note 2\)](#) and [Marine conservation zones and marine licensing](#).
29. Where proposals provide 'like for like' compensation to address residual impacts, compensation should be provided in the affected marine protected areas as the preferred option. The requirements of SE-MPA-1 may also be satisfied where 'like for like' compensation is provided outside of the affected marine protected areas.
30. Where 'like for like' compensation is not achievable, or if compensation can only be offered in an area not currently designated as part of the marine protected area network, the proposed compensation measures may result in an impact on the ecological coherence of the network. The statutory nature conservation bodies will advise on the effect of residual impacts, after compensation, on the ecological coherence of the network. Where the statutory nature conservation bodies advise that it is not possible to assess the impact, there will be no further requirements for proposals or decision-makers to consider the network.

31. Public authorities should apply this policy when carrying out any function capable of affecting the south east marine plan area, including strategic planning and enforcement decisions, and should refer to site conservation objectives and advice from the statutory nature conservation bodies. Public authorities must also consider cumulative, combined or synergistic effects which their functions, authorisations and enforcement may have, with regards to any advice issued by the statutory nature conservation bodies.
32. Consideration of impacts at the network level should also be undertaken at a strategic level, addressed through mechanisms such as:
- Environmental Impact Assessments
 - [Regional environmental assessments](#), eg marine aggregate regional environmental assessments
 - [Strategic Environmental Assessments](#)
 - Assessments and measures to achieve Good Environmental Status with regard to support of the [Marine Strategy Regulations 2010](#)

Signposting

33. Existing measures which relate to and may contribute to the achievement of this policy include:
- [Conservation of Habitats and Species Regulations 2017](#)
 - [Conservation of Offshore Marine Habitats and Species Regulations 2017](#)
 - [Marine and Coastal Access Act 2009](#)
 - [Wildlife and Countryside Act 1981](#)
 - [Countryside and Rights of Way Act 2000](#)
 - [South East Inshore Fisheries and Conservation Authority byelaws](#)
 - [North East Kent Marine Protected Area Management](#)
34. Further information and guidance that may help in implementing the policy include:
- Statutory [conservation advice packages](#) for marine protected areas 0-12nm (Natural England)
 - Statutory [conservation advice packages](#) for marine protected areas 12-200nm (Joint Nature Conservation Committee)
 - Joint Nature Conservation Committee [Marine Protected Area mapper](#)
35. MIS layers:
- European Marine Sites & Ramsars
 - Marine Conservation Zones
 - Sites of Special Scientific Interest
 - Habitats Directive Annex 1 features

SE-MPA-2

Proposals that enhance a marine protected area's ability to adapt to climate change, enhancing the resilience of the marine protected area network will be supported. Proposals that may have adverse impacts on an individual marine protected area's ability to adapt to the effects of climate change and so reduce the resilience of the marine protected area network, must demonstrate that they will, in order of preference: a) avoid, b) minimise, c) mitigate adverse impacts.

What are marine protected areas?

1. Marine protected areas are areas of the sea protected by law for nature conservation purposes. They protect geological features and habitats and species on the sea bed, in the water column, on the sea surface or in the air above.
2. Marine protected areas in the south east marine plan area include:
 - Ramsar Sites – wetlands of international importance
 - Special Protection Areas (including proposed sites) – rare, vulnerable or threatened birds
 - Special Areas of Conservation (including candidate sites and Sites of Community Importance) – habitats and species in need of conservation
 - Marine Conservation Zones (including recommended sites) – geological features, habitats and species typical of UK waters
 - Sites of Special Scientific Interest – geological features, flora and fauna of special interest
3. Ramsar Sites, Special Protection Areas and Special Areas of Conservation are designated and protected under the [Conservation of Habitats and Species Regulations 2017](#) and the [Conservation of Offshore Marine Habitats and Species Regulations 2017](#). Marine Conservation Zones are designated and protected under the [Marine and Coastal Access Act 2009](#). Sites of Special Scientific Interest are designated and protected under the [Wildlife and Countryside Act 1981](#) and the [Countryside and Rights of Way Act 2000](#).
4. For Special Protection Areas and Special Areas of Conservation, areas outside the designated area that are important to features for which a site has been designated are also protected, for example birds that are protected by a Special Protection Area are also protected when they are outside the boundary of the site.

What is resilience and the ability to adapt to climate change?

5. Resilience is defined in guidance by the [Oslo/Paris Convention for the Protection of the Marine Environment of the North-East Atlantic](#) as “the ability of an ecosystem to recover from disturbances within a reasonable timeframe”. A resilient ecosystem can absorb, resist or recover from damage and disturbance caused by human activities and natural change, including climate change, and continues to provide ecosystem services. They are more likely to recover from or withstand environmental fluctuations and unexpected events, and can potentially replenish other damaged populations.
6. Responding to the effects of climate change requires global action. This policy highlights the importance of adaptive management for the protection of habitats and species, and protects the integrity of the marine protected area network design principles. The design principles of the marine protected area network as laid out in the [Joint Administration Statement](#) promote the resilience of marine ecosystems through:
 - inclusion of replicates of representative habitats within the network
 - connectivity between sites
 - ensuring sites are of a viable size
 - effective protection of features
7. It is too early to determine if the network in its current state is sufficient to achieve full resilience, for example sites may be too far apart for some species depending on their dispersal strategies. Adaptive management is essential to help mitigate the effects of climate change and to maintain the coherence of the marine protected area network in the south east marine plan area.

Where in the south east marine plan area are marine protected areas affected by climate change?

8. Up to date information on the location of marine protected areas in the south east marine plan area can be found on the Joint Nature Conservation Committee [Marine Protected Area mapper](#) which is an interactive resource containing information on the marine protected areas designated in UK waters. The network of marine protected areas is likely to change over the period of this plan and the most up to date information should be used when applying this policy.
9. Conservation advice packages and Information on the condition of marine protected areas, including those affected by climate change, is provided by Natural England for inshore marine protected areas within 12nm through the [Designated Sites View](#). The Joint Nature Conservation Committee provides conservation advice and condition information for marine protected areas between 12-200nm through the [Site Information Centres](#). Conservation advice packages include statutory advice on the qualifying features of a site and their conservation objectives, including advice on seasonality of mobile features. They advise how to further the conservation objectives, and they identify activities that are capable of affecting the qualifying features and the processes they depend upon.

10. Coastal habitats in the south east marine plan area are particularly sensitive to the effects of climate change. They experience changes in rainfall, temperature, storminess and wave energy, but also habitat loss due to erosion and sea-level rise. Coastal habitats support a rich assemblage of marine species and rely on natural sediment supply and transport to maintain their natural, dynamic state.
11. The [Marine Climate Change Impacts Partnership](#) reports that natural sea defence provided by coastal habitats the inshore south east marine area may face increasing erosional pressure due to sea level rise and an increase in storm events.
12. Coastal habitats can, and do, adapt to change, but an increase in coastal flood and erosion events in the inshore south east marine plan area has led to a reliance on coastal protection assets. Where fixed landward assets prevent habitat migration or 'roll back', habitat loss is likely to occur due to coastal squeeze. Fixed structures within the marine area can also create barriers to species movement.
13. The south east marine plan area supports internationally significant populations of breeding and overwintering seabirds. The [Marine Climate Change Impacts Partnership 2017 Report Card](#) states that the breeding success of seabirds are strongly linked to temperature rises and changes in fish prey populations such as sandeels. Short term weather events such as severe summer storms are also having a severe negative effect on the breeding performance of some species. It is predicted that there will be a continuing shift northwards in habitat suitability and prey availability for many species over the coming century.
14. Evidence of long-term shifts in the distribution and abundance of marine species due to higher temperatures is now discernible ([UK Climate Change Risk Assessment 2017](#)). These shifts are expected to continue and become more widespread, with some species potentially benefiting, but others losing suitable space.

When should this policy be applied?

15. SE-MPA-2 applies year round and throughout the lifetime of the South East Marine Plan.
16. Marine protected areas in the south east marine plan area are already being affected by climate change ([Sustainability Appraisal Scoping Report for the South East Marine Plans](#)). Seabird breeding populations increased in the UK over the last century, but breeding success has declined over the same period. The [Marine Climate Change Impacts Partnership](#) considers climate change to be the main driver of this decline. Coastal erosion is already effecting much of the shoreline throughout the inshore south east marine plan area, while much of the shoreline remains protected with defence work or artificial beaches ([Marine Climate Change Impacts Partnership](#)). Climate change will continue to affect marine protected areas in the south east marine plan area over the long-term. Due to the time lag in the climate system, even with the most ambitious mitigation efforts, we are likely to experience further climate change over the coming decades.

Why are resilient marine protected areas important to the south east marine plan area?

17. The loss of coastal habitats can impact the integrity of an individual marine protected area and the local ecosystem, but it can also impact the ecological coherence of the wider network, especially if the design principles of the network are compromised. This is particularly relevant for sensitive habitats that are not formally protected but which may need to be designated in the future to maintain the coherence of the network. Habitat loss could also have a direct impact on the species that rely on the habitat.
18. In addition to protecting internationally significant marine biodiversity, marine protected areas in the south east marine plan area provide natural capital assets and ecosystem services that offer social and economic benefits. Seagrass and saltmarsh habitat absorbs carbon from the atmosphere, dunes, rocky reefs and sand and mudflats offer natural coastal protection, while the rich diversity of wildlife and natural beauty of marine protected areas in the south east marine plan area offer inspiring places to live, work and visit.
19. As stated in the [Joint Administration Statement](#), linking the marine protected areas in the south east marine plan area 'together in an ecologically coherent network, supported by wider environmental management measures will achieve benefits more effectively than individual marine protected areas can alone.'
20. Marine protected areas in the south east marine plan area play a significant role in achieving the UK government's vision for clean, healthy, safe, productive and biologically diverse oceans and seas. They contribute to targets in the [United Nations Convention on Biological Diversity](#) to protect 10% of the world's coastal and marine areas by 2020, and are part of the [UK programme of measures](#) to achieve 'Good Environmental Status' in UK waters under the [Marine Strategy Regulations 2010](#). These commitments are reinforced in the [UK Marine Policy Statement](#) through a commitment to 'complete an ecologically coherent network as part of a broad based approach to nature conservation' (3.1.2). Marine plans should build in sufficient flexibility to take account of climate change impacts, for example by 'changing or moving current uses/spatial allocations, or safeguarding areas for future uses' (2.6.7.8).
21. The [National Planning Policy Framework](#) includes commitments to enhance the natural environment by 'minimising impacts on and providing net gains for biodiversity, including by establishing coherent ecological networks that are more resilient to current and future pressures' (para.170(d)). The [25 Year Environment Plan](#) from the Department for Environment, Food and Rural Affairs commits to increasing the proportion of protected and well-managed seas, and better management of existing protected sites.
22. Adapting to the effects of climate change is promoted through the Department for Environment, Food and Rural Affairs [National flood and coastal erosion risk management strategy for England](#) and the [Climate Change Act 2008](#).

Who is this of interest to?

23. This policy applies to any organisation or individual putting forward a proposal including, but not restricted to, those applying for an authorisation. A proposal can be for a new activity or a change to an existing activity that is subject to management by public authorities.
24. Public authorities must take any authorisation or enforcement decisions in accordance with this policy. Authorisation and enforcement decisions are defined under Section 58(4) of the [Marine and Coastal Access Act 2009](#).
25. Public authorities must also have regard to this policy when exercising any function capable of affecting the south east marine plan area, but which are separate from authorisation and enforcement decisions (Section 58(3) of the [Marine and Coastal Access Act 2009](#)). Such functions include but are not limited to:
 - strategic planning
 - land and water management
 - waste management
 - access management
 - flood and erosion risk management
 - fisheries management

How should this policy be applied?

26. This policy applies to marine protected areas throughout the south east marine plan area and any areas required to support the adaptation of marine protected areas to the effects of climate change.
27. Public authorities will support proposals that enhance the ability of a marine protected area to adapt to the effects of climate change where it complies with other policies in this plan and relevant legislation.
28. Proposals that enhance the ability of a marine protected area to adapt to the effects of climate change should include information demonstrating how this will be achieved. Enhancement refers to measures taken which have a positive impact. An example of enhancement could include the removal of hard coastal defence structures in favour of soft engineering which enables habitat roll back.
29. Where positive impacts have been identified, proposals must also assess adverse impacts in line with relevant legislation. Enhancement is not a substitute for avoidance, minimisation or mitigation measures.
30. Proposals must still comply with requirements under relevant legislation including the [Conservation of Habitats and Species Regulations 2017](#), the [Conservation of Offshore Marine Habitats and Species Regulations 2017](#), the [Marine and Coastal Access Act 2009](#), [Wildlife and Countryside Act 1981](#), the [Countryside and Rights of Way Act 2000](#), the [Town and Country Planning \(Environmental Impact Assessment\) Regulations 2017](#), and other national legislation.

31. Proposals that may have adverse impacts on the ability of a marine protected area to adapt to the effects of climate change must demonstrate that they will, in order of preference, avoid, minimise or mitigate these impacts. Proposals cannot proceed to (b) unless they have first demonstrated why they cannot meet (a), and so on. If these criteria cannot be met it will only be authorised if there are relevant considerations in line with the Marine and Coastal Access Act Section 58(2)).
32. Adaptation could be recovery (where impact has occurred), opportunity for habitat migration if necessary (for example due to sea level rise) or amendment to site boundaries in response to climate driven range shifts which is enabled through policy SE-MPA-3.
33. Inclusion of this information does not indicate that approval of the proposal will follow by default. That will also depend on other material considerations to be taken into account by the decision-maker which may include, for example, other plans.
34. Where proposals cannot avoid, minimise or mitigate adverse impact but are in the public interest, they must state the case for proceeding with details of how compensation of equal environmental benefit will be achieved.
35. Public authorities must consider and account for adaptation in the face of potential impacts from climate change. Public authorities must also take into account other relevant projects, programmes and plans, and matters including those outlined in the Marine Policy Statement 2.6.8.
36. The Marine Policy Statement (2.6.7.5) sets out that decisions on and proposals for marine and coastal developments should take account of climate change projections. There are a number of sources of advice available, including the [Climate Change Risk Assessment](#), [UK Climate Projections](#) and [Marine Climate Change Impact Partnership](#) reports.
37. For Special Areas of Conservation and Special Protection Areas the impact can be considered in the determination of 'likely significant effect' and subsequent appropriate assessment if required.

Grouping	Marine Protected Areas 'B'	Code	SE-MPA-3

Policy

SE-MPA-3

Where statutory advice states that a marine protected area site condition is deteriorating or that features are moving or changing due to climate change, a suitable boundary change to ensure continued protection of the site and coherence of the overall network should be considered.

What are marine protected areas?

1. Marine protected areas are areas of the sea protected by law for nature conservation purposes. They protect geological features and habitats and species on the sea bed, in the water column, on the sea surface or in the air above.
2. Marine protected areas in the south east marine plan area include:
 - Ramsar Sites – wetlands of international importance
 - Special Protection Areas (including proposed sites) – rare, vulnerable or threatened birds
 - Special Areas of Conservation (including candidate sites and Sites of Community Importance) – habitats and species in need of conservation
 - Marine Conservation Zones (including recommended sites) – geological features, habitats and species typical of UK waters
 - Sites of Special Scientific Interest – geological features, flora and fauna of special interest
3. Ramsar Sites, Special Protection Areas and Special Areas of Conservation are designated and protected under the [Conservation of Habitats and Species Regulations 2017](#) and the [Conservation of Offshore Marine Habitats and Species Regulations 2017](#). Marine Conservation Zones are designated and protected under the [Marine and Coastal Access Act 2009](#). Sites of Special Scientific Interest are designated and protected under the [Wildlife and Countryside Act 1981](#) and the [Countryside and Rights of Way Act 2000](#).
4. For Special Protection Areas and Special Areas of Conservation, areas outside the designated area that are important to features for which a site has been designated are also protected.

What is site condition?

5. Site condition is the condition of the qualifying features of a marine protected area. Condition may be reported as favourable (maintained or recovered), unfavourable (recovering, no change or declining), or destroyed (partially or completely). Site

condition is monitored by statutory nature conservation bodies who provide advice to government and other public authorities in relation to marine protected areas. The most up-to-date information on site condition for marine protected areas in the south east inshore marine plan area can be found on the [Designated Sites View](#). Condition for sites in the south east offshore marine plan area can be found through the [Site Information Centres](#).

6. Climate change can affect and impact the condition of site features, particularly if the ability of habitats and species to shift their ranges in response to climate change is limited by human activities. The loss or movement of features from a site, or a decline in their condition due to climate change, may result in unfavourable condition. Boundary changes are an important consideration for adaptive management to maintain the integrity of the site.

Where in the south east marine plan area is site condition affected by climate change?

7. Up to date information on the location of marine protected areas in the south east marine plan area can be found on the Joint Nature Conservation Committee [Marine Protected Area mapper](#) which is an interactive resource containing information on the marine protected areas designated in UK waters. The network of marine protected areas is likely to change over the period of this plan and the most up to date information should be used when applying this policy.
8. Conservation advice packages and Information on the condition of marine protected areas, including those affected by climate change, is provided by Natural England for inshore marine protected areas within 12nm through the [Designated Sites View](#). The Joint Nature Conservation Committee provides conservation advice and condition information for marine protected areas between 12-200nm through the [Site Information Centres](#). Conservation advice packages include statutory advice on the qualifying features of a site and their conservation objectives, including advice on seasonality of mobile features. They advise how to further the conservation objectives, and they identify activities that are capable of affecting the qualifying features and the processes they depend upon.

When should this policy be applied?

9. SE-MPA-3 applies throughout the entire south east marine plan area. The policy applies when the Department for Environment, Food and Rural Affairs accepts statutory advice (based on condition assessments) from the statutory nature conservation bodies that a boundary change is required to ensure the continued protection of site features if they have altered as a result of climate change. Advice may include deselection of an existing site and selection of a replacement site.
10. Climate change will continue to affect marine protected areas in the south east marine plan area over the long-term. Due to the time lag in the climate system, even with the most ambitious mitigation efforts, we are likely to experience further climate change over the coming decades. Evidence of long-term shifts in the distribution and abundance of marine species due to higher temperatures is now discernible ([UK Climate Change Risk Assessment 2017](#)). These shifts are expected to continue and become more widespread, with some species potentially benefiting, but others losing suitable space.

Why is a flexible management approach for marine protected area boundaries in response to climate change important to the south east marine plan area?

11. There is a high number of overlapping marine protected areas in the south east marine plan area. A change in the natural range of habitats and species will likely result in the displacement of another habitat or species which may also be a protected feature. The number of overlapping sites, many of which are large with extensive boundaries, means marine protected areas in the south east marine plan area are particularly susceptible to feature migration or loss caused by climate change.
12. Coastal habitats are particularly vulnerable. Coastal squeeze resulting in loss of intertidal habitats and species, including birds, may affect the extent or quality of protected sites and/or the features for which they have been designated. This may require new compensatory habitat to be created and/or designated in coastal areas.
13. Site condition monitoring is important to understand how the condition of a marine protected area and its qualifying features are changing over time and to inform adaptive management.
14. The [UK Marine Policy Statement](#) states that marine plans should build in “sufficient flexibility to take account of climate change impacts, for example by introducing appropriate criteria for selection or de-selection of protected marine areas, seeking the advice of statutory advisors, changing or moving current uses/spatial allocations, or safeguarding areas for future uses” (2.6.7.8). Marine plans will endeavour to achieve this but will not seek to duplicate existing regimes, for example, the role of the Department for Environment Food and Rural Affairs in designating marine protected areas.

Who is this of interest to?

15. The statutory nature conservation bodies monitor and assess the condition of marine protected areas and they should clearly state when the condition of a feature is changing or deteriorating due to climate change. This policy should also be considered when recommending and designating new marine protected areas to ensure that boundaries allow for adaptive management if necessary.
16. The Department for Environment, Food and Rural Affairs should consider this policy when designating, amending or de-selecting marine protected areas.
17. Public authorities who manage and regulate the placement of hard constraints (for example coastal defences) in the marine area may also need to consider the future need for adaptive management in line with policy SE-MPA-2.

How should this policy be applied?

18. This policy applies to marine protected areas throughout the south east marine plan area and any areas required to support the adaptation of marine protected areas to the effects of climate change.

19. One aspect of managing a marine protected area is enabling the features for which a site is designated to adapt to climate change, for example through a boundary change or even a new site location. It is important to raise the potential for such changes as the process of identifying, designating and providing conservation advice for sites is still underway.
20. The statutory nature conservation bodies will flag condition assessments which show that a protected feature has changed its location due to a shift in range, or an increase or decrease in its extent, abundance or assemblage. If climate change is found to be the causing factor, a suitable boundary change should be considered. A boundary change will not be supported where the condition of a site has deteriorated due to pressures from human activities, as this should be addressed through revised site management measures.
21. Where it is not possible to alter a site boundary due to hard constraints (for example a sea wall), public authorities should consider actions to remove barriers where possible to enable the features of the site to adapt. It will be necessary to consult relevant Shoreline Management Plans.
22. In certain cases the removal of barriers will not be possible due to their usage as flood and coastal erosion protection. This policy supports use of soft defences in preference to hard defences where coastal defence is necessary. Soft defences enable boundary changes should the need occur through condition assessments. Further consideration regarding the removal of barriers to enable range shifts and boundary changes to occur should be applied in light of policy SE-CC-3.
23. This policy focuses on deterioration of site condition and the potential future requirement for suitable boundary changes. This should be considered alongside policy NW-MPA-2 which details the consideration required to ensure individual marine protected areas have the ability to adapt to climate change.

Iteration 3 draft

Policy drafting template SE-MPA-4

HLMO	Living Within Environmental Limits	Sub bullet(s)	Biodiversity is protected, conserved and where appropriate recovered and loss has been halted.
Grouping	Marine Protected Areas 'B'	Code	SE-MPA-4

Policy

SE- MPA-4

Until the ecological coherence of the marine protected area network is confirmed, proposals should demonstrate that they will, in order of preference: a) avoid, b) minimise, c) mitigate adverse impacts on features that may be required to complete the network, d) if it is not possible to mitigate adverse impacts, proposals should state the case for proceeding.

What is a marine protected area network features?

1. Marine protected area network features are those habitats, species, ecological processes, geological or geomorphological features listed as requiring protection and enhancement through the designation of a marine protected area.
2. The government is committed to completing an ecologically coherent network of marine protected areas to contribute towards commitments under the [Oslo/Paris Convention for the Protection of the Marine Environment of the North-East Atlantic](#) and requirements of the [Marine Policy Statement](#) (3.1.2). This aim is supported by targets in the Department for Environment, Food and Rural Affairs [25 Year Environment Plan](#) to increase the proportion of protected and well-managed seas, and better manage existing protected sites.
3. To support the development of the marine protected area network as described in the [Marine and Coastal Access Act \(Section 123\(2\)\)](#) it is important to protect potential locations for further marine protected areas which may be needed to complete the network in the future. Potential features should remain in sufficient condition to merit designation.
4. Ecological coherence of the UK marine protected area network is currently assessed at a bio-geographical, regional sea scale. Coherence within UK Secretary of State covered waters has been assessed by the statutory nature conservation bodies and potential gaps in the network have been identified in advice to the Department for Environment, Food and Rural Affairs.

Where are potential marine protected area network features in the south east marine plan area?

5. This policy concentrates on areas beyond protected sites that may need to be designated in the future. The Joint Nature Conservation Committee [Marine Protected Area mapper](#) is an interactive resource containing information on the marine protected areas designated in UK waters. The network of marine protected areas is likely to change over the period of this plan and the most up to date information should be used when applying this policy.

6. The potential features to consider when applying policy SE-MPA-4 are restricted to Features of Conservation Importance identified by the Joint Nature Conservation Committee listed in the [Ecological Network Guidance, Annex 1 habitats](#), habitats and species included in the Natural Environment and Rural Communities Act [Section 41 list](#), and the Oslo/Paris Convention [List of Threatened and/or Declining Species and Habitats](#). The best available evidence with advice from the statutory nature conservation bodies for the location of these features within the south east marine plan area should be used when applying this policy.
7. The south east marine plan area are recognised for supporting internationally significant habitats and populations of marine life. While much of the plan area is protected with marine protected areas, large areas remain undesignated. Coastal habitats are particularly vulnerable to habitat loss due to coastal squeeze and other effects of climate change which could have a direct impact on protected species that rely on these areas. This is particularly relevant for sensitive habitats that are not formally protected but important to the coherence of the network, and/or may be needed to fill gaps in the network in the future.

When should this policy be applied?

8. SE-MPA-4 applies year round and throughout the lifetime of the South East Marine Plan, or until the network as described in the [Marine and Coastal Access Act \(Section 123\(2\)\)](#) is complete, thereby completing the government's contribution towards an ecologically coherent network.
9. There are limited temporal considerations when considering the location of potential marine protected area network features in the south east marine plan area. Geological features and habitats are generally present year round with limited to no seasonality. Mobile species, such as birds, seals and cetaceans, follow predictable seasonal patterns.

Why are potential marine protected area network features important to the south east marine plan area?

10. Marine protected areas in the south east marine plan area are an important tool for protecting biodiversity, ecosystem services and natural capital assets, and to prevent habitat loss. They benefit rare, vulnerable and threatened habitats and species, as well as those typical to UK waters. They support the local economy, provide opportunities for research, health and well-being, and provide inspirational places to live, work and visit.
11. As stated in the [Joint Administration Statement](#), linking the marine protected areas in the south east marine plan area 'together in an ecologically coherent network, supported by wider environmental management measures will achieve benefits more effectively than individual marine protected areas can alone.'
12. Protecting a representative range of features that are connected and replicated in more than one site are principles of an ecologically coherent network. The marine protected areas in the south east marine plan area play a significant role in achieving the UK government's vision for clean, healthy, safe, productive and biologically diverse oceans and seas. They contribute to targets in the [United Nations](#)

[Convention on Biological Diversity](#) to protect 10% of the world's coastal and marine areas by 2020, and are part of the [Marine Strategy Part Three: UK programme of measures](#) to achieve Good Environmental Status in UK waters under the [Marine Strategy Regulations 2010](#), particularly for Descriptor 1 – biodiversity and Descriptor 6 – seafloor integrity. These commitments are reinforced in the [Marine Policy Statement](#) through a commitment to 'complete an ecologically coherent network as part of a broad based approach to nature conservation' (3.1.2). The [Marine Policy Statement](#) (3.1.7) also highlights the aim to halt biodiversity loss and the potential to identify additional areas for future designation to complete the network as described in the [Marine and Coastal Access Act \(Section 123\(2\)\)](#). The [National Planning Policy Framework](#) includes commitments to promote the conservation, restoration and enhancement of priority habitats, ecological networks and the protection and recovery of priority species (174(b)). The [25 Year Environment Plan](#) from the Department for Environment, Food and Rural Affairs commits to increasing the proportion of protected and well-managed seas, and better management of existing protected sites.

Who is this of interest to?

13. This policy applies to any organisation or individual putting forward a proposal including, but not restricted to, those applying for an authorisation. A proposal can be for a new activity or a change to an existing activity that is subject to management by public authorities.
14. Public authorities must take any authorisation or enforcement decisions in accordance with this policy. Authorisation and enforcement decisions are defined under Section 58(4) of the [Marine and Coastal Access Act 2009](#).
15. Public authorities must also have regard to this policy when exercising any function capable of affecting the south east marine plan area, but which are separate from authorisation and enforcement decisions (Section 58(3) of the [Marine and Coastal Access Act 2009](#)). Such functions include but are not limited to:
 - strategic planning
 - land and water management
 - waste management
 - access management
 - flood and erosion risk management
 - fisheries management

How should this policy be applied?

16. This policy applies throughout the south east marine plan area.
17. As highlighted in policy SE-MPA-1, considering an ecologically coherent network in decision-making is yet to be agreed. Until such time, characteristics of a marine protected area network have been set out in the marine conservation zone consultation document. It highlights the need to consider wider network coherence in addition to considering the objectives of individual sites. This is based on principles agreed by the UK.

18. Until the network as described in the [Marine and Coastal Access Act \(Section 123\(2\)\)](#) is complete, thereby completing the government's contribution towards an ecologically coherent network, proposals should demonstrate, in order of preference, that they will avoid, minimise or mitigate adverse impacts on features that may need to be included in the future - proposals cannot proceed to (b) unless they have first demonstrated why they cannot meet (a) etc. This aligns with requirements set out in the [Marine Policy Statement](#) (2.3.1.2). When the network is complete, proposals will no longer be required to demonstrate compliance with S-MPA-4, but should be aware of broader biodiversity requirements under SE-BIO-1. Proposals should take note of the following paragraphs to understand what public authorities will consider when assessing proposals.
19. Until the network is complete, when assessing proposals public authorities should apply precaution within an overall risk-based approach, taking account of the best available evidence and with regard to advice from the statutory nature conservation bodies. Decision-making should be reasonable and proportionate, with a focus on features that are more sensitive to pressures (for example affects from climate change). Concentrating on these will allow easier assessment of where more immediate action is needed to complete the network.
20. When assessing proposals, public authorities should consider Features of Conservation Importance listed in the [Ecological Network Guidance, Annex 1 habitats](#), habitats and species included in the Natural Environment and Rural Communities Act [Section 41 list](#), and the Oslo/Paris Convention [List of Threatened and/or Declining Species and Habitats](#) The [Natural Environment and Rural Communities Act](#) (Section 41), requires the Secretary of State to publish a list of habitats and species of principal importance for the conservation of biodiversity in England.
21. Public authorities should also use the [Section 41 list](#) to identify which habitats and species should be given priority when applying SE-BIO-1, and the requirements of section 15 of the [National Planning Policy Framework](#) to create, protect, enhance and manage networks of biodiversity.
22. Public authorities should consider cumulative impacts arising from multiple proposals on the potential future inclusion of features within the marine protected area network. Where it is not possible to mitigate significant adverse impacts, proposals should state the case for proceeding, including how the proposal supports the South East Marine Plan vision and plan policies. Inclusion of this information does not indicate that approval of the proposal will follow by default. That will also depend on other material considerations to be taken into account by the decisionmaker which may include, for example, other plans.
23. Public authorities should have regard to this policy when carrying out functions capable of effecting the south east marine plan area. The Section 41 list should be used to guide public authorities in implementing their duty under the [Natural Environment and Rural Communities Act](#) (Section 40), to have regard to the conservation of biodiversity in England when carrying out their functions.

Policy

SE-MPA-6

Proposals must demonstrate that they will, in order of preference:

- a) avoid
- b) minimise
- c) mitigate significant adverse impacts on designated geodiversity

What is designated geodiversity?

1. Geodiversity is the term used to describe the variety of landforms, rocks, minerals, fossils, soils and natural processes that underlie and determine the character of our landscape and seascape. The UK's rich geodiversity tells the story of Earth's complicated past, providing evidence of past life and environmental conditions stretching back over 2,800 million years. The UK's changing coastline provides an unparalleled slice through our geodiversity as the action of the sea and waves continuously exposes new rocks and sediments.
2. There is an intimate relationship between geodiversity and biodiversity. Geodiversity and the way it influences landscapes, sediments and climate is fundamental to the distribution of habitats and species, for example, intertidal rocky shores and subtidal sands and gravels each support their own unique assemblages of marine plants and animals.
3. Geodiversity receives statutory protection in the English marine area through the designation and protection of:
 - Sites of Special Scientific Interest under the [Wildlife and Countryside Act 1981](#) and the [Countryside and Rights of Way Act 2000](#)
 - Marine Conservation Zones under the [Marine and Coastal Access Act 2009](#)
 - National Parks under the [National Parks and Access to the Countryside Act 1949](#) and Areas of Outstanding Natural Beauty under the [Countryside and Rights of Way Act 2000](#).
4. Non-statutory conservation of geodiversity is provided through the designation and protection of [Regionally Important Geological/Geomorphological Sites](#). These sites are designated through local site selection procedures and are considered the most important places in the UK for Earth science outside of the statutory sites. [Heritage Coast](#) designations are another non-statutory landscape designation that may include important geodiversity.

Where are designated geodiversity sites in the south east marine plan area?

5. [GeoConservation Kent](#) provides information about important geological features in the Kent area. The [London Geodiversity Action Plan](#) discusses some of the geological history in the area. The [Essex Geodiversity action](#) plan describes important sites in the north of the south east marine plan area.
6. The [Geological Conservation Review Series](#) is a public record of over 3,000 Sites of Special Scientific Interest that represent the range of geomorphological features in Britain. The [Geological Conservation Database](#) is an inventory of each site and contains basic information and some full site reports. The information is administered by the Joint Nature Conservation Committee who also provide a [UK map of Geological Conservation Review Sites](#).
7. The [Designated Sites View](#) provides information, including conservation objectives, on Sites of Special Scientific Interest and Marine Conservation Zones and the activities that are likely to cause damage. The [Site of Special Scientific Interest Impact Risk Zone and Marine Conservation Zone data](#) provides information to carry out an initial assessment of potential risks posed by a proposal.

When should this policy be applied?

8. SE-MPA-6 applies year round and throughout the lifetime of the South East Marine Plan. Geodiversity in the south east marine plan area has formed over millions of years and natural change happens slowly over long timescales. There are no specific seasonality or temporal considerations that need to be considered for geological features throughout the south east marine plan area.

Why is geodiversity important to the south east marine plan area?

9. For its size, the UK is regarded as one of the most geodiverse places in the world. The practice of Earth science was developed in the UK and many periods of geological time were first defined and named here. The south east marine plan area is relatively young in geological terms, with the oldest surface rock aged at only 80 million years. The most famous geological feature of the plan area is perhaps the London Clay Formation, famous for its high fossil content.
10. Geodiversity is finite and sensitive to change. Understanding and valuing geodiversity is critical to understanding the planet and how the decisions made influence the future of our environment. Geodiversity has an important role to play in ensuring that the natural environment continues to provide important ecosystem services.
11. Geodiversity supports our economy and influences where we live. Its sustainable use is critical to the future well-being of our environment and for the ecosystem services that it provides. Our geological past can be used to predict changes in our environment, offering insights into climate change and how it might affect our lives. Minerals and aggregates are a major economic resource. Protected landscapes are valued for tourism, while coastal processes influenced by geodiversity can provide natural protection from flood and coastal erosion, such as the estuarine systems in the south east inshore marine plan area. Geodiversity provides a wide range of habitats that in turn support a rich assemblage of marine life, including coastal cliffs

which support thousands of seabirds throughout the south east inshore marine plan area.

12. The [Marine Policy Statement](#) states “development should aim to avoid harm to marine ecology, biodiversity and geological conservation interests (including geological and morphological features), including through location, mitigation and consideration of reasonable alternatives” (2.6.1.3). Also, that “development proposals may provide, where appropriate, opportunities for building-in beneficial features for marine ecology, biodiversity and geodiversity as part of good design” (2.6.1.4).
13. The [National Planning Policy Framework](#) states that “Planning policies and decisions should contribute to and enhance the natural and local environment by protecting and enhancing valued landscapes, sites of biodiversity or geological value and soils” (170).
14. The [UK Geodiversity Action Plan](#) provides an agreed framework for geodiversity action across the UK. Objective 6 seeks “to conserve and manage our geodiversity through appropriate recognition at international, national and local levels.” Objective 7 seeks “to maintain and enhance our geodiversity through the management of sites, areas and wider landscapes.”

Who is this of interest to?

15. This policy applies to any organisation or individual putting forward a proposal including, but not restricted to, those applying for an authorisation. A proposal can be for a new activity or a change to an existing activity that is subject to management by public authorities.
16. Public authorities must take any authorisation or enforcement decisions in accordance with this policy. Authorisation and enforcement decisions are defined under Section 58(4) of the [Marine and Coastal Access Act 2009](#).
17. Public authorities must also have regard to this policy when exercising any function capable of affecting the south east marine plan area, but which are separate from authorisation and enforcement decisions (Section 58(3) of the [Marine and Coastal Access Act 2009](#)). Such functions include but are not limited to:
 - strategic planning, including aggregate and minerals planning
 - flood and erosion risk management
 - access management
 - fisheries management
 - byelaw development for Sites of Special Scientific Interest - National Parks and authorities that manage National Nature Reserves have powers to develop byelaws to protect Sites of Special Scientific Interest within their jurisdiction under [Section 28R of the Wildlife and Countryside Act 1981](#)

How should this policy be applied?

18. This policy applies to all statutory and non-statutory designated geodiversity sites throughout the south east marine plan area.

19. Proposals that have significant adverse impacts on geological features of Sites of Special Scientific Interest, Marine Conservation Zones or Regionally Important Geological Sites must demonstrate that they have, in order of preference, avoided, minimised or mitigated such impacts in accordance with statutory monitoring requirements, such as [Marine Conservation Zone Assessment](#), [Sites of Special Scientific Interest Assessment](#), and the conservation objectives set out by the statutory nature conservation bodies. Proposals cannot proceed to (b) unless they have first demonstrated why they cannot meet (a), and so on.
20. Inclusion of this information does not indicate that approval of the proposal will follow by default. Approval will also depend on other material considerations taken into account by the decision-maker which may include, for example, other plans.
21. Consideration of impacts to geodiversity sites should also be undertaken at a strategic level, addressed through mechanisms such as:
- [Environmental Impact Assessments](#)
 - [Regional environmental assessments](#), eg marine aggregate regional environmental assessments
 - [Strategic Environmental Assessments](#)

Signposting

Grouping	Invasive non-native species	Code	SE-NIS-1

Policy

SE-NIS-1

Proposals that reduce the risk of spread and/or introduction of non-native invasive species within the south east marine plan area and adjacent plan areas should be supported.

Proposals must put in place appropriate measures to avoid or minimise significant adverse impacts that would arise through the introduction and transport of non-native invasive species, particularly when: 1) moving equipment, boats or livestock (for example fish or shellfish) from one water body to another 2) introducing structures suitable for settlement of non-native invasive species, or the spread of non-native invasive species known to exist in the area.

What are non-native and non-native invasive species?

1. Non-native (sometimes referred to as non-indigenous) species are those introduced outside of their natural past or present distribution which might survive and subsequently reproduce. In many cases non-native species do not cause harm to the local environment or economy. The [Great Britain Non-Native Species Secretariat](#) describes non-native invasive species as any non-native species that has the ability to spread, causing damage to the environment, economy, human health or the way we live. Non-native species can become 'invasive' when they cause significant adverse impacts. For example, the carpet sea squirt (*Didemnum vexillum*) was confirmed in British waters in 2008. It spreads quickly and smothers equipment, boat hulls, fishing equipment and native habitats, such as mussel beds. Highly invasive species often reproduce quickly, can adapt quickly to a broad range of situations (water quality, food availability), have a diverse gene pool, and/or are associated with human activities.
2. The [South East Inshore Marine Plan Sustainability Appraisal Scoping Report Cards](#) identify the following non-native invasive species in this marine plan area:
 - Orange sheath tunicate (*Botrylloides violaceus*)
 - Chinese mitten crab *Eriocheir sinensis*
 - Leathery sea squirt *Styela clava*
 - Pacific oyster *Crassostrea gigas*
 - American oyster drill *Urosalpinx cinerea*
 - Slipper limpet *Crepidula fornicata*
 - Carpet sea squirt *Didemnum vexillum*

3. There may be a different assemblage of species present in other parts of the south east marine plan area, or species yet to be discovered and recorded. The assemblage and geographical range of species may change over the period covered by this plan. Looking at areas beyond the south east marine plan area can provide an idea of the species that may become a problem in the future. The most up to date evidence should be used when applying this policy. The [National Biodiversity Network Atlas](#) aggregates data from multiple sources and shows where species have been recorded in the UK.

Where in the south east marine plan area are non-native invasive species likely to establish?

4. The distribution of many non-native invasive species is currently limited by water temperature ([Marine Climate Change Impacts Partnership: Science Review](#)), but species are spreading and becoming established through a combination of climate change, migration and human introduction.
5. Non-native invasive species are most likely to establish in areas where activities known to spread and/or introduce invasive species occur. Such activities are referred to as pathways of spread and introduction. High risk pathways include:
 - Commercial and recreational boating (through hull fouling)
 - Trans-shipment through ship ballast water discharge
 - Aquaculture (unintentional escape of species, of conditions become favourable for species establishment)
 - Port, harbour and marina infrastructure (species can colonise structures and equipment)
 - Coastal protection infrastructure (species can colonise structures)
 - Commercial and recreational fishing (fouling of gear and equipment)
 - Recreational water activities (fouling of equipment)
 - Relocation of structures and equipment
 - Marine litter and debris (species attached to floating material)
 - Aquariums (escape of plants and animals)
 - 'Hitchhiking' of species with goods transported for trade
6. Registered aquaculture businesses are present throughout the south east marine plan area, producing mussels, Pacific oysters, Native oysters, Manila clam, Parlourde clam, hard clam and cockles.
7. High levels of recreational boating and water sports occur around Clacton-on-Sea, Southend-on-Sea, Margate, Herne Bay and the Stour and Orwell estuaries. There are particular concentrations of charter boats for sea fishing around Dover, Ramsgate, Southend-on-Sea and Burnham, while shore angling is popular all along the Kent and Essex coasts.
8. The majority of freight is transported through the ports of London, Dover and Felixstowe, with large numbers of international journeys between Dover and Calais. Approximately half of all cruise passengers visiting English ports arrive in the south east marine plan area due to the presence of significant ports at Dover and Tilbury.
9. Aquaculture sites, together with the locations of ports, harbours marinas and slipways in the south east marine plan area can be found on the [Marine Information](#)

[System](#). Maps showing recreational and commercial vessel activity are also available.

When should this policy be applied?

10. SE-NIS-1 applies year round and throughout the lifetime of the South East Marine Plan. Non-native invasive species are already present in the south east marine plan area. Due to increasing temperatures associated with climate change and an expected increase in marine activities that are potential pathways for introduction ([Futures Analysis for the South East Marine Plan Area](#)) there is a high risk of other invasive species moving into the south east during the twenty year lifetime of the South East Marine Plan. The way in which the policy is applied may therefore change over the lifetime of the plan dependant on the species present.

Why is management of non-native invasive species important in the south east marine plan area?

11. There is a high risk of non-native invasive species being introduced and spread within the south east marine plan area over the period covered by the plan due to climate change and an expected increase in high risk pathways. The [Invasive Non-Native Species Framework Strategy for Great Britain](#) encourages a stronger sense of shared responsibility across government, key stakeholder organisations, land managers and the general public for actions and behaviours that will reduce the threats posed by non-native invasive species and the impacts they cause.
12. The [Futures Analysis for the South East Marine Plan Area](#) suggests that the south east marine plan area has the largest share of recreational boating and cruising activities compared to other English marine plan areas. Marine berths in the south east marine plan area represent 17% of all coastal berths in England (British Marine Federation Tourism, 2014)¹. Charter boats for sea fishing represent 21% of the English total (Defra, 2012)². Guidance by the [Royal Yachting Association](#) recognises that 'recreational boating has the potential to spread these species across inland waters'.
13. The south east is home to the UK's largest concentration of ports and is often described as the 'Gateway to the World' due to the volume of both passenger and freight traffic. Freight traffic is expected to increase over the period covered by the South East Marine Plan, which could increase the future risk of non-native invasive species in the vicinity of ports and harbours. The Thames is regarded by the Great Britain Non-Native Species Secretariat as a major entry point for the introduction of non-native invasive species.
14. The south east marine plan area produces 36% of the English tonnage of oysters, with 16 Pacific oyster businesses in operation ([Futures Analysis for the South East Marine Plan Area](#)). There is a dynamic and well-established population of Pacific oyster on the north east Kent coast which has capacity to expand in number, density and range aided by increasing sea temperature, warmer summers and milder winters ([Pacific Oyster Survey of the North East Kent European Marine Sites](#)).

¹ British Marine Federation Tourism (2014). Economic Benefits of UK Boating Tourism.

² Defra (2012). Sea Angling 2012 – a survey of recreational sea angling activity and economic value in England.

Climatic conditions in the south east marine plan area can now support the natural spread and establishment of this species which highlights the need for management.

15. While the activities above provide high risk pathways for the spread and/or introduction of non-native invasive species, they are also important economic activities in the south east marine plan area. This makes them particularly vulnerable to the impacts caused by non-native invasive species. Introduced species can have an adverse impact on or outcompete commercially valuable species. They can affect fish and shellfish directly through competition, predation or by bringing disease and parasites, or indirectly by affecting food sources or the availability of habitat. They can also smother vessels and equipment associated with intakes and out falls, marinas, ports, harbours and aquaculture. Control methods, where applied to nuisance species, are fairly ineffective, can be costly, and no non-native marine species has yet been successfully eradicated from British waters.
16. Invasive species can also cause significant adverse impacts on local biodiversity, making ecosystems less resilient to change. Through lack of natural predators, competition for space, food or other factors, non-native species can impact local food webs, replace or prey on native species in the area, or introduce diseases to a local system, to which native species are not resistant. The south east marine plan area supports a diverse range of internationally significant habitats and species which are potentially vulnerable to the introduction of non-native invasive species. Intertidal mussel beds situated between Birchington and Westgate in the North East Kent European Marine Site are being replaced by Pacific oyster reefs. Mussel beds at Swalecliffe, Coldharbour and Ramsgate are also impacted by Pacific oysters with unpredictable consequences for the local ecosystem.
17. The [Convention on Biological Diversity](#) acknowledges non-native invasive species as one of the most significant threats to marine biodiversity, especially in light of climate change and increasing global trade, transport and tourism. This threat is recognised by a wide range of international and UK legislation.
18. Due to the difficulties in managing non-native invasive species once they establish in the marine area, the [Invasive Non-Native Species Framework Strategy for Great Britain](#) promotes the importance of early prevention. The [Convention on Biological Diversity](#) details prevention, detection/surveillance and control/eradication as the three main ways of dealing with invasive species, with prevention given the highest priority. These aims are supported by the Department for Environment, Food and Rural Affairs [25 Year Environment Plan](#) which highlights the importance of early pre-emptive action, and the development of action plans for all high-priority pathways of introduction. The [Wildlife and Countryside Act 1981](#) also includes measures to prevent the spread of non-native species. The Port of London Authority is also developing strategic biosecurity measures to support the [Tidal Thames Vision](#) and has established the Vision Invasive Non-Native Species Group with members from non-governmental organisations, businesses, regulators and the Great Britain Invasive Non-Native Species Secretariat.
19. The [Marine Strategy Part Three: UK programme of measures](#) recognises that marine planning will make a positive contribution towards the achievement of Good Environmental Status and has the potential to contribute to all descriptors, including Descriptor 2 – non-indigenous species. Due to the expected increased risk and impacts caused by non-native invasive species policies SE-NIS-1 and SE-NIS-2 will

contribute towards the prevention of further introduction and spread caused by human activities.

Who is this of interest to?

20. SE-NIS-1 is of interest to a wide range of public authorities and organisations to ensure shared responsibility and a co-ordinated approach to the management of non-native invasive species³.
21. SE-NIS-1 applies to any organisation or individual putting forward a proposal including, but not restricted to, those applying for an authorisation or consent. A proposal can be for a new activity or a change to an existing activity that is subject to management by public authorities.
22. Proposals that could potentially reduce the risk of spread and/or introduction of non-native species include, but are not limited to:
 - diversification of aquaculture businesses who decide to cultivate native species rather than non-native species
 - removal or management of non-native invasive species
 - monitoring and surveillance of non-native invasive species
 - installation of facilities to help manage the risk of spread and/or introduction of non-native invasive species, such as cleaning facilities to wash down vessels and water equipment
23. Proposals that could potentially provide high risk pathways for the introduction or spread of non-native invasive species in the south east marine plan area may be associated with, but are not limited to:
 - recreational boating and watersports
 - angling
 - aquaculture, particularly of species that are not native to the south east marine plan area and are known to be invasive
 - placement of hard structures that can create 'stepping stones'
24. This policy does not apply to ballast water management which is regulated through the International Maritime Organization [International Convention for the Control and Management of Ships' Ballast Water and Sediments](#). The convention provides a framework to address the issues of ballast water and the spread of non-native species.
25. Public authorities must take any authorisation or enforcement decisions in accordance with this policy. Authorisation and enforcement decisions are defined under Section 58(4) of the [Marine and Coastal Access Act 2009](#).
26. Public authorities must also have regard to this policy when exercising any function capable of affecting the south east marine plan area, but which are separate from authorisation and enforcement decisions (Section 58(3) of the [Marine and Coastal Access Act 2009](#)). Public authority functions and the prevention of non-native invasive species are addressed by policy SE-NIS-2.

³ Invasive Non-Native Species Framework Strategy for Great Britain (2008)

How should this policy be applied?

27. This policy applies throughout the south east marine plan area. In applying this policy the term adjacent is taken as to be close by, by the side of, or bordering on the marine plan area.
28. Public authorities should support proposals that reduce the risk of spread and/or introduction of non-native species within the south east marine plan area and adjacent plan areas where they comply with other policies in this plan and other relevant legislation.
29. Proposals that reduce the risk of spread and/or introduction of non-native species should include information demonstrating how this will be achieved.
30. Proposals related to high risk pathways must demonstrate how they will avoid or minimise significant adverse impacts on the marine area from the introduction and transport of non-native species, or the spread of non-native invasive species known to exist in the area. This should be achieved through improved management of high risk pathways and the development of action plans.
31. Examples of how to avoid or minimise the risk of introduction, transportation and/or spread of non-native invasive species include, but are not limited to:
 - biosecurity action planning, implementation and monitoring during the operational stages of a proposal
 - providing freshwater wash-down facilities in new marinas, clubs and training centres with appropriate training facilities
 - maintaining boat hulls clear of fouling organisms, particularly when moving to and from different areas
 - cleaning boats and equipment (for example. aquaculture cages, fouled buoys and lines) before transporting them from one water body to another
 - cleaning and drying recreational gear (for example dive and fishing gear) after use minimising the amount of vessel traffic to offshore platforms
 - using power wash or brush systems for in-water cleaning if boats are not regularly moved. In-water in water cleaning which results in a deposit will require a separate [Marine Licence](#)
32. The [UK Marine Pathways Project](#) has developed guidance and best practice to reduce the risk of introduction and spread of non-native invasive species, and a number of [training tools](#) on biosecurity planning. [Marine Biosecurity Planning Guidance for Wales and England](#) (Natural England and Natural Resources Wales 2015) also provides guidance on writing of biosecurity plans.
33. Proposals are required to be in compliance with relevant legislation and regulations including the [Aquatic Animal Health \(England and Wales\) Regulations](#), [Marine and Coastal Access Act](#), [Water Environment Regulations Assessment](#), [Habitats Regulations Assessment](#), [Environmental Impact Assessment](#), the [Ballast Water Management Convention](#) and National Policy Statements where they apply.
34. Public authorities must assess new proposals for measures to avoid or minimise significant adverse impacts on the marine area from the introduction and transport of

non-native species, or the spread of non-native invasive species known to exist in the area.

35. Monitoring and management of non-native invasive species in the south east marine plan area poses significant challenges due to the different ways in which species are introduced and spread. Public authorities should use the best available evidence and apply the precautionary principle as a way of approaching decision making in the absence of full scientific certainty in line with the Convention on Biological Diversity [Guiding Principles for the Prevention, Introduction and Mitigation of Impacts of Alien Species that threaten Ecosystems, Habitats or Species](#).
Proposals considered under SE-BIO-1 which incorporate features that enhance or facilitate natural habitat and species adaptation, migration and connectivity must comply with policy SE-NIS-1.

HLMO	Living within environmental limits	Sub bullet(s)	Healthy marine and coastal habitats occur across their natural range and are able to support strong, biodiverse biological communities and the functioning of healthy, resilient and adaptable marine ecosystems
Grouping	Invasive non-native species	Code	SE-NIS-2

Policy

SE-NIS-2

Public authorities with functions to manage activities that could potentially introduce, transport or spread non-native invasive species in the south east marine plan area should implement adequate biosecurity measures to avoid or minimise the risk of introducing, transporting or spreading non-native invasive species.

What are non-native and non-native invasive species?

1. Non-native (sometimes referred to as non-indigenous) species are those introduced outside of their natural past or present distribution which might survive and subsequently reproduce. In many cases non-native species do not cause harm to the local environment or economy. The [Great Britain Non-Native Species Secretariat](#) describes non-native invasive species as any non-native species that has the ability to spread, causing damage to the environment, economy, human health or the way we live. Non-native species can become 'invasive' when they cause significant adverse impacts. For example, the carpet sea squirt (*Didemnum vexillum*) was confirmed in British waters in 2008. It spreads quickly and smothers equipment, boat hulls, fishing equipment and native habitats, such as mussel beds. Highly invasive species often reproduce quickly, can adapt quickly to a broad range of situations (water quality, food availability), have a diverse gene pool, and/or are associated with human activities.
2. The [South East Inshore Marine Plan Sustainability Appraisal Scoping Report Cards](#) identify the following non-native invasive species in this marine plan area:
 - Orange sheath tunicate (*Botrylloides violaceus*)

 - Carpet sea squirt *Didemnum vexillum*
3. There may be a different assemblage of species present in other parts of the south east marine plan area, or species yet to be discovered and recorded. The

assemblage and geographical range of species may change over the period covered by this plan. Looking at areas beyond the south east marine plan area can provide an idea of the species that may become a problem in the future. The most up to date evidence should be used when applying this policy. The [National Biodiversity Network Atlas](#) aggregates data from multiple sources and shows where species have been recorded in the UK.

Where in the south east marine plan area are non-native invasive species likely to establish?

4. The distribution of many non-native invasive species is currently limited by water temperature ([Marine Climate Change Impacts Partnership: Science Review](#)), but species are spreading and becoming established through a combination of climate change, migration and human introduction.
5. Non-native invasive species are most likely to establish in areas where activities known to spread and/or introduce invasive species occur. Such activities are referred to as pathways of spread and introduction. High risk pathways include:
 - Commercial and recreational boating (through hull fouling)
 - Trans-shipment through ship ballast water discharge
 - Aquaculture (unintentional escape of species, of conditions become favourable for species establishment)
 - Port, harbour and marina infrastructure (species can colonise structures and equipment)
 - Coastal protection infrastructure (species can colonise structures)
 - Commercial and recreational fishing (fouling of gear and equipment)
 - Recreational water activities (fouling of equipment)
 - Relocation of structures and equipment
 - Marine litter and debris (species attached to floating material)
 - Aquariums (escape of plants and animals)
 - 'Hitchhiking' of species with goods transported for trade
6. Registered aquaculture businesses are present throughout the south east marine plan area, producing mussels, Pacific oysters, Native oysters, Manila clam, Parlourde clam, hard clam and cockles.
7. High levels of recreational boating and water sports occur around Clacton-on-Sea, Southend-on-Sea, Margate, Herne Bay and the Stour and Orwell estuaries. There are particular concentrations of charter boats for sea fishing around Dover, Ramsgate, Southend-on-Sea and Burnham, while shore angling is popular all along the Kent and Essex coasts.
8. The majority of freight is transported through the ports of London, Dover and Felixstowe, with large numbers of international journeys between Dover and Calais. Approximately half of all cruise passengers visiting English ports arrive in the south east marine plan area due to the presence of significant ports at Dover and Tilbury. Aquaculture sites, together with the locations of ports, harbours marinas and slipways in the south east marine plan area can be found on the [Marine Information System](#). Maps showing recreational and commercial vessel activity are also available.

When should this policy be applied?

9. SE-NIS-2 applies year round and throughout the lifetime of the South East Marine Plan. Non-native invasive species are already present in the south east marine plan area. Due to increasing temperatures associated with climate change and an expected increase in marine activities that are potential pathways for introduction ([Futures Analysis for the South East Marine Plan Area](#)) there is a high risk of other invasive species moving into the south east during the twenty year lifetime of the South East Marine Plan. The way in which the policy is applied may therefore change over the lifetime of the plan dependant on the species present.

Why is management of non-native invasive species important in the south east marine plan area?

10. There is a high risk of non-native invasive species being introduced and spread within the south east marine plan area over the period covered by the plan due to climate change and an expected increase in high risk pathways. The [Invasive Non-Native Species Framework Strategy for Great Britain](#) encourages a stronger sense of shared responsibility across government, key stakeholder organisations, land managers and the general public for actions and behaviours that will reduce the threats posed by non-native invasive species and the impacts they cause.
11. The Futures Analysis for the South East Marine Plan Area suggests that the south east marine plan area has the largest share of recreational boating and cruising activities compared to other English marine plan areas. Marine berths in the south east marine plan area represent 17% of all coastal berths in England (British Marine Federation Tourism, 2014)¹. Charter boats for sea fishing represent 21% of the English total (Defra, 2012)². Guidance by the [Royal Yachting Association](#) recognises that 'recreational boating has the potential to spread these species across inland waters'.
12. The south east is home to the UK's largest concentration of ports and is often described as the 'Gateway to the World' due to the volume of both passenger and freight traffic. Freight traffic is expected to increase over the period covered by the South East Marine Plan, which could increase the future risk of non-native invasive species in the vicinity of ports and harbours. The Thames is regarded by the Great Britain Non-Native Species Secretariat as a major entry point for the introduction of non-native invasive species.
13. The south east marine plan area produces 36% of the English tonnage of oysters, with 16 Pacific oyster businesses in operation ([Futures Analysis for the South East Marine Plan Area](#)). There is a dynamic and well-established population of Pacific oyster on the north east Kent coast which has capacity to expand in number, density and range aided by increasing sea temperature, warmer summers and milder winters ([Pacific Oyster Survey of the North East Kent European Marine Sites](#)). Climatic conditions in the south east marine plan area can now support the natural spread and establishment of this species which highlights the need for management. While the activities above provide high risk pathways for the spread and/or introduction of non-native invasive species, they are also important economic

¹ British Marine Federation Tourism (2014). Economic Benefits of UK Boating Tourism.

² Defra (2012). Sea Angling 2012 – a survey of recreational sea angling activity and economic value in England.

activities in the south east marine plan area. This makes them particularly vulnerable to the impacts caused by non-native invasive species. Introduced species can have an adverse impact on or outcompete commercially valuable species. They can affect fish and shellfish directly through competition, predation or by bringing disease and parasites, or indirectly by affecting food sources or the availability of habitat. They can also smother vessels and equipment associated with intakes and out falls, marinas, ports, harbours and aquaculture. Control methods, where applied to nuisance species, are fairly ineffective, can be costly, and no non-native marine species has yet been successfully eradicated from British waters.

14. Invasive species can also cause significant adverse impacts on local biodiversity, making ecosystems less resilient to change. Through lack of natural predators, competition for space, food or other factors, non-native species can impact local food webs, replace or prey on native species in the area, or introduce diseases to a local system, to which native species are not resistant. The south east marine plan area supports a diverse range of internationally significant habitats and species which are potentially vulnerable to the introduction of non-native invasive species. Intertidal mussel beds situated between Birchington and Westgate in the North East Kent European Marine Site are being replaced by Pacific oyster reefs. Mussel beds at Swalecliffe, Coldharbour and Ramsgate are also impacted by Pacific oysters with unpredictable consequences for the local ecosystem.
15. The [Convention on Biological Diversity](#) acknowledges non-native invasive species as one of the most significant threats to marine biodiversity, especially in light of climate change and increasing global trade, transport and tourism. This threat is recognised by a wide range of international and UK legislation.
16. Due to the difficulties in managing non-native invasive species once they establish in the marine area, the [Invasive Non-Native Species Framework Strategy for Great Britain](#) promotes the importance of early prevention. The [Convention on Biological Diversity](#) details prevention, detection/surveillance and control/eradication as the three main ways of dealing with invasive species, with prevention given the highest priority. These aims are supported by the Department for Environment, Food and Rural Affairs [25 Year Environment Plan](#) which highlights the importance of early pre-emptive action, and the development of action plans for all high-priority pathways of introduction. The [Wildlife and Countryside Act 1981](#) also includes measures to prevent the spread of non-native species. The Port of London Authority is also developing strategic biosecurity measures to support the [Tidal Thames Vision](#) and has established the Vision Invasive Non-Native Species Group with members from non-governmental organisations, businesses, regulators and the Great Britain Invasive Non-Native Species Secretariat.
17. The [Marine Strategy Part Three: UK programme of measures](#) recognises that marine planning will make a positive contribution towards the achievement of Good Environmental Status and has the potential to contribute to all descriptors, including Descriptor 2 – non-indigenous species. Due to the expected increased risk and impacts caused by non-native invasive species policies SE-NIS-1 and SE-NIS-2 will contribute towards the prevention of further introduction and spread of non-native invasive species through human pathways.

Who is this of interest to?

18. SE-NIS-2 is of interest to a wide range of public authorities and organisations to ensure shared responsibility and a co-ordinated approach to the management of non-native invasive species³.
19. Public authorities must have regard to this policy when exercising any function capable of affecting the south east marine plan area, but which are separate from authorisation and enforcement decisions (Section 58(3) of the [Marine and Coastal Access Act 2009](#)). Decisions related to authorisations and enforcement and non-native invasive species are addressed by policy SE-NIS-1.
20. Public authority functions related to the management of activities that could potentially introduce and/or spread non-native species include but are not limited to:
 - strategic planning
 - land management
 - aquaculture regulation and monitoring
 - coastal protection
 - access management
 - provision and management of commercial and recreational boating infrastructure and equipment, including for watersports and angling
 - ballast water transfer
21. This policy does not apply to ballast water management which is regulated through the International Maritime Organization [International Convention for the Control and Management of Ships' Ballast Water and Sediments](#). The convention provides a framework to address the issues of ballast water and the spread of non-native species.

How should this policy be applied?

22. This policy applies throughout the south east marine plan area to public authorities that manage activities known to spread and/or introduce non-native invasive species but which are not managed through formal authorisations or consents.
23. Public authorities with access management functions, particularly ports, harbours and those responsible for marinas, are encouraged to raise awareness of non-native invasive species prevention amongst users. This should include awareness of the potential for artificial structures to become platforms or 'stepping stones' that can facilitate the settlement or spread of non-native species, and the potential risks from moving equipment between water bodies. Measures can also include the promotion of codes of conduct such as the [Check, Clean Dry campaign](#) for recreational anglers and boat users, or the development of biosecurity management plans and monitoring.
24. Authorities responsible for shoreline management should also be aware of the risks posed by the placement of hard structures on the coastline and build in adequate biosecurity measures during strategic planning. Biosecurity measures associated with individual coastal protection schemes are addressed by policy SE-NIS-1.

³ Invasive Non-Native Species Framework Strategy for Great Britain (2008)

25. The [UK Marine Pathways Project](#) has developed guidance and best practice to reduce the risk of introduction and spread of non-native invasive species, and a number of [training tools](#) on biosecurity planning. [Marine Biosecurity Planning Guidance for Wales and England](#) (Natural England and Natural Resources Wales 2015) has been produced to guide the writing of biosecurity plans.
26. Monitoring and management of non-native invasive species can be challenging due to the different ways in which species are introduced and spread. The Convention on Biological Diversity [Guiding Principles for the Prevention, Introduction and Mitigation of Impacts of Alien Species that threaten Ecosystems, Habitats or Species](#) discuss the precautionary principle as a way of approaching decision-making in the absence of full scientific certainty.
27. Public authorities should apply this policy to functions that are capable of effecting adjacent marine plan areas due to the transboundary nature of non-native invasive species.

Policy

SE-UWN-1

Proposals generating impulsive sound must contribute data to the UK Marine Noise Registry as per any currently agreed requirements. Public authorities must take account of any currently agreed targets under the UK Marine Strategy part one descriptor 11.

What is impulsive sound?

1. All marine activities introduce sound into the marine environment to a greater or lesser extent during construction, operation or decommissioning. Underwater noise occurs either as non-impulsive noise (including shipping propulsion, operational vibrational noise, induced turbulence) or as impulsive noise (discrete impulsive sounds including explosives, seismic surveys or construction piling).
2. There are natural sources of impulsive and non-impulsive sound in the marine environment, such as communication by marine fauna, lightning and wave action, but growing human use has increased background, non-impulsive noise levels over the last 50 years. While impulsive sound has also increased, less is known about its temporal and spatial distribution and the magnitude of trends.
3. Noise is often used to describe unwanted anthropogenic sound, however, for the purposes of this plan, sound and noise are deemed to have the same meaning and therefore are used interchangeably.

Where does underwater noise occur in the south east marine plan area?

4. The inshore area features some military exercise and practice areas run by the Ministry of Defence which have the potential to cause underwater noise through, for example, detonation of explosives. Offshore wind resource areas are distributed throughout the inshore area indicating the potential for development in the future. Offshore energy projects often involve geophysical surveys, piling and detonation of unexploded ordnance which emit impulsive noise. There is also the potential for further port and harbour development along the south east coast particularly in the Thames estuary, within the inshore plan area. The south east marine plan area have some of significant shipping traffic activity alongside noise caused by other activities such as dredging and piling for offshore developments.

When does underwater noise take place in south east marine plan area?

5. Much of the development is along the coastline and there is little seasonality to impulsive noise from construction. Offshore construction is often restricted by sea state and sensitive periods for overwintering birds, therefore, construction occurs mainly in summer months. This policy applies for any impulsive noise occurring year-round within the south east marine plan area.

Why is contributing to the underwater noise registry important in the south east marine plan area?

6. Underwater noise resulting from activities and developments can have adverse impacts on marine life and is a growing concern. Chronic noise disturbance has the potential to result in long-term negative impacts particularly for highly mobile species including fish, birds, marine mammals and turtles.¹ Ambient noise impacts may include masking communication, disruption of navigational ability, impaired hunting ability and disorientation. At higher levels, noise may change behaviour resulting in avoidance of areas including important feeding and breeding areas or present chronic stress. Impulsive sounds may also cause temporary or permanent hearing damage to individuals and at high intensities can result in death.
7. The noise registry aims to monitor man-made impulsive noise to quantify the pressure on the environment by making available an overview of relevant impulsive sound sources, throughout the year. This in turn will aid in the definition of a baseline level for impulsive noise in UK waters and ensure pressures are managed effectively.
8. Marine noise has the potential to mask biologically relevant signals; it can lead to a variety of behavioural reactions, affect hearing organs and injure or even kill marine life ([Marine Policy Statement](#) 2.6.3).. Management of noise and its sources can bring additional benefits, for example making the human working environment less dangerous and improving the efficiency, integrity and life of vessels and structures.²
9. In UK law the Marine Strategy Regulations (2010) set out the requirements for Good Environmental Status in UK waters. The management of underwater noise is a key component of this. The Government has published a UK Marine Strategy that sets how this will achieve or maintain Good Environmental Status in UK waters. Part 3 of the Marine Strategy (Programme of Measures) recognises that marine planning will make a positive contribution towards the achievement of Good Environmental Status including underwater noise. Regulations to begin to address underwater noise in this way, represents a growing concern over the addition of noise in the marine environment from human activity. Considerable uncertainty exists around the spatial and temporal elements of noise as well as the magnitude of it and resulting impacts.
10. Implementation of this policy will help make sure these collective pressures are considered in line with the UK Marine Strategy and the Marine Strategy Regulations(2010).

¹ As set out in the [Marine strategy part three: UK programme of measures](#)

² ibid

Who is this of interest to?

11. Government with specific responsibilities include:
 - Department for Environment Food and Rural Affairs
 - Ministry of Housing, Communities and Local Government – local authorities
 - Department for Transport – harbour authorities
 - Department for Business, Energy and Industrial Strategy – oil and gas installations, offshore renewables over 100MW
12. This policy will be of interest to public authorities. This includes authorities that make decisions relating to the sectors and resources mentioned above and decisions on activities that interact with those sectors and resources. This policy also applies to those with a wider interest, for example in taking account of the marine plans in their own planning. Examples include but is not restricted to the Joint Nature Conservation Committee that leads the [Marine Noise Registry](#) which supports the UK's implementation of descriptor 11 of the Marine Strategy Regulations 2010.

How should this policy be applied?

13. The UK Marine Strategy outlines the measures that contribute to the achievement and maintenance of good environmental status in UK seas by 2020. It sets a target 'to establish a noise registry' to 'record, assess, and manage the distribution and timing of anthropogenic sound sources'. The contribution of data to the [Marine Noise Registry](#) on impulsive noise will help determine current baseline levels of impulsive noise, including providing the spatial and temporal distribution of impulsive noise generating activities.
14. Proposals must provide information to the Marine Noise Registry on the projected noise generated from the proposed activity prior to it taking place. Following the completion of the activity, the actual noise generated, in line with the requirements of the consenting regime under which the proposals are approved, or on a voluntary basis where no consenting process is currently in place. The [Marine Noise Registry](#) sets out a simple process for how to do this. For example, it is a condition of the consent issued by the Department for Business, Energy and Industrial Strategy for any geological survey undertaken by the oil, gas and carbon capture and storage sectors that, following completion of the survey, survey logs and a close out report must be submitted and this data informs the Noise Registry.
15. Proposals must define expected noise types, levels and dates, considering all stages of the development.
16. Public authorities must take account of any currently agreed targets under the UK Marine Strategy part one descriptor 11 and ensure any proposals being consented are in line with these targets before providing any authorisation.

Iteration 3 draft

Policy drafting template SE-UWN-2

HLMO	Living within environmental limits	Sub bullet(s)	Healthy marine and coastal habitats occur across their natural range and are able to support strong, biodiverse biological communities and the functioning of healthy, resilient and adaptable marine ecosystems.
Grouping	Disturbance	Code	SE-UWN-2

Policy

SE-UWN-2

Proposals that generate impulsive or non-impulsive noise must demonstrate that they will, in order of preference: a) avoid, b) minimise, c) mitigate significant adverse impacts on highly mobile species, d) if it is not possible to mitigate significant adverse impacts, proposals must state the case for proceeding.

What is underwater noise?

1. All marine activities introduce sound into the marine environment to a greater or lesser extent during construction, operation or decommissioning. Noise generally refers to anthropogenic sound. Underwater noise occurs either as non-impulsive noise (including ambient noise, shipping propulsion, operational vibrational noise,) or as discrete impulsive sounds (including detonation of explosives, seismic surveys or construction piling).
2. There are natural sources of sound in the marine environment, such as communication between marine fauna, wave action and lightening, but growing human use has increased background non-impulsive noise levels over the last 50 years. While impulsive sound has also increased, less is known about its temporal and spatial distribution and the magnitude of trends.

Where does underwater noise occur in the south east marine plan area?

3. The south east inshore marine plan area is home to several ports in the UK which have the potential for maintenance and expansion and therefore increased noise inputs. Coastal construction is likely to involve production of impulsive underwater noise in the inshore area. The south east inshore marine plan area has some wind farms (Thames Array) and oil and gas exploration and licence areas. Such energy projects often involve geophysical surveys, piling and detonation of unexploded ordnance which emit impulsive noise.

When does underwater noise occur in the south east marine plan area?

4. When considering noise in relation to those affected by it, there are seasonal considerations due to migration, spawning and foraging behaviour.

5. Human activity in the south east marine plan area occurs year-round. Tourism and recreation at the coast reaches its peak in the summer months. Marine development both on and offshore occur year-round and will therefore need to consider their impact to mobile species.

Why are noise impacts on highly mobile species important to the south east marine plan area?

6. Underwater noise resulting from activities and developments can have adverse impacts on marine life and is a growing concern. Chronic noise disturbance has the potential to result in long-term negative impacts particularly for highly mobile species including fish, birds, marine mammals and turtles.¹ Ambient noise impacts may include masking communication, disruption of navigational ability, impaired hunting ability and disorientation. At higher levels, noise may change behaviour resulting in avoidance of areas including important feeding and breeding areas or present chronic stress. Impulsive sounds may also cause temporary or permanent hearing damage to individuals and at high intensities can result in death.
7. Marine noise has the potential to mask biologically relevant signals; it can lead to a variety of behavioural reactions, affect hearing organs and injure or even kill marine life ([Marine Policy Statement](#) 2.6.3). Management of noise and its sources can bring additional benefits, for example making the human working environment less dangerous and improving the efficiency, integrity and life of vessels and structures.
8. In UK law the [Marine Strategy Regulations \(2010\)](#) set out the requirements for Good Environmental Status in UK waters. The management of underwater noise is a key component of this. The Government has published a UK Marine Strategy that sets how this will achieve or maintain Good Environmental Status in UK waters. Part 3 of the [Marine Strategy \(Programme of Measures\)](#) recognises that marine planning will make a positive contribution towards the achievement of Good Environmental Status including underwater noise. The addressing of underwater noise in this way, represents a growing concern over the addition of noise in the marine environment from human activity. Considerable uncertainty exists around the spatial and temporal elements of noise as well as the magnitude of it and resulting impacts. The south east marine plan area is home to busy areas for shipping, coastal and marine development and dredging.

Who is this of interest to?

9. Government with specific responsibilities include:
 - Department for Environment Food and Rural Affairs
 - Ministry of Housing, Communities and Local Government – local authorities
 - Department for Transport – harbour authorities
 - Department for Business, Energy and Industrial Strategy – oil and gas installations, offshore renewables over 100MW
10. This policy will be of interest to public authorities. This includes authorities that make decisions relating to the sectors and resources mentioned above and decisions on activities that interact with those sectors and resources. This policy also applies to those with a wider interest, for example in taking account of the marine plans in their

¹ As set out in the [Marine strategy part three: UK programme of measures](#)

own planning. Examples include but are not restricted to the Environment Agency that leads on the Water quality management; and the Joint Nature Conservation Committee that leads the Marine Noise Registry which supports the UK's implementation of Good Environmental Status in relation to underwater noise.

How should this policy be applied?

11. Proposals must demonstrate that they will, in order of preference, avoid, minimise or mitigate significant adverse impacts of underwater noise on highly mobile species - proposals cannot proceed to (b) unless they have first demonstrated why they cannot meet (a) throughout the hierarchy.
12. Where it is not possible to mitigate, proposals must state the case for proceeding including how the proposal supports the south east marine plan vision, objectives and other plan policies. Inclusion of this information does not indicate that approval of the proposal will follow by default. That will also depend on other material considerations to be taken into account by the decision-maker which may include, for example, other plans.
13. For impulsive noise, measures could include:
 - avoid – marine mammal observers or passive acoustic monitoring that can stop noise generation while sensitive species are present. Not generating impulsive noise generating during sensitive periods (such as breeding, rearing, hibernation, migration)
 - minimise – eliminating or controlling noise at source, for example using alternative quieter approaches like drilling foundations instead of piling
 - mitigate – soft start piling allowing sensitive species to avoid the area or attenuation measures, for example bubble curtains or pile collars
14. For non-impulsive noise, these measures could include:
 - avoid – change vessel routing away from sensitive species or areas
 - minimise – design specifications to reduce operational vibration (for example, in vessels or infrastructure) or imposing speed restrictions in sites of sensitivity that reduce noise generated
 - mitigation – use attenuation measures, for example acoustic baffles
15. Proposals and public authorities should use best available evidence and, where knowledge gaps exist, expert judgement.
16. In determining the proposal, public authorities will take account of a range of relevant considerations including compliance with legislation and regulations and potential impacts highlighted in project level assessments. Public authorities should be aware that in some cases noise is used as a mitigation measure for other pressures, for example the use of pingers in in some fisheries to reduce bycatch.
17. Responsibility for regulation of noise resides with the licensing authority. For example the Department for Business, Energy and Industrial Strategy regulate noise associated with oil and gas activities and carbon capture and storage. The Marine Management Organisation regulates noise for marine licences and deemed marine licences including renewable energy.

Signposting

18. Existing measures which relate to, and may contribute to the achievement of this policy include:

- [Marine and Coastal Access Act 2009](#)
- [Planning Act 2008](#)
- [The Marine Strategy Regulations 2010](#)
- [Wildlife and Countryside Act 1981](#)
- [Environmental Protection Act 1990](#)
- [The Environmental Assessment of Plans and Programmes Regulations 2004](#)
- [National Planning Policy Framework](#)
- [UK Marine Policy Statement](#)

19. Further information and guidance that may help in implementing the policy include:

- [JNCC piling guidelines](#)
- [JNCC seismic guidelines](#)
- [Managing underwater noise in European waters \(JNCC\)](#)
- [Marine noise registry](#)

20. Further information and guidance that may help in implementing the policy includes datasets on the [Marine Information System](#), including, but not limited to:

- seal density
- habitats and species
- seabird density
- fish habitat

HLMO	Living within environmental limits	Sub bullet(s)	Healthy marine and coastal habitats occur across their natural range and are able to support strong, biodiverse biological communities and the functioning of healthy, resilient and adaptable marine ecosystems.
Grouping	Water quality	Code	SE-WQ-1

Policy

SE-WQ-1

Proposals that may have significant adverse impacts upon water quality, including upon habitats and species beneficial to water quality must demonstrate that they will, in order of preference:

- a) avoid
- b) minimise
- c) mitigate significant adverse impacts

What is water quality?

1. Water quality is a measure of the condition of water and its suitability to sustain a range of uses for both biotic and human benefits. Good water quality is important in meeting the UK government's vision for clean, healthy, safe, productive and biologically diverse seas and oceans ([Marine Policy Statement](#)). Water quality in respect of the [Water Environment \(Water Framework Directive\) \(England and Wales\) Regulations 2017](#) is defined by specific biological, physico-chemical and hydromorphological criteria. The objectives of the [Water Environment \(Water Framework Directive\) \(England and Wales\) Regulations 2017](#) to protect and improve water quality, set ambitious environmental goals and actions which are implemented by [River Basin Management Plans](#). This policy seeks to complement these objectives and River Basin Management Plan implementation.

What causes poor water quality in the south east marine plan area?

2. Poor water quality refers to the presence of pollutants in water. These pollutants may include oil, sedimentation, sewage, nutrients and heavy metals. Water pollution can come from either diffuse (unlicensed sources) or point sources (regulated sources). In the south east inshore marine plan area there are issues for water pollution from industry, storm overflows and agricultural run-off.
3. Water quality is also affected by:
 - physical modifications to water ways
 - changes to the natural flow and level of water
 - negative effects of invasive non-native species
 - resuspension of sediment
 - extreme weather such as drought followed by intense rainfall

- seasonal population variation
4. Developments within the marine area can cause poor water quality. A number of policies in the South East Marine Plan support activities that could have adverse impacts upon water quality including (SE-INF-1, SE-CAB-1, SE-AGG-4, SE-DD-2).
 5. The following aspects of any proposal needs to be considered:
 - water body (or bodies) potentially affected, including adjacent water bodies
 - duration of the activity
 - location
 - physical footprint with respect to the water body size
 - scale of impact
 - mitigation measures that could reduce any potentially adverse impact
 - presence of sensitive habitats
 - presence of contaminated sediments
 6. The expected increase in the number and diversity of developments and marine users within the south east marine plan area poses additional risk towards meeting Good status for ecological and chemical objectives in accordance with the [Water Environment \(Water Framework Directive\) \(England and Wales\) Regulations 2017](#) and Good Environmental Status in accordance with [The Marine Strategy Regulations 2010](#).

Where is water quality important in the south east marine plan area?

7. Water quality in the south east marine plan area is important in rivers, estuaries and coastal waters. These areas play a vital role in the areas economy through providing essential fish habitats and supporting commercial shell fisheries, whilst providing safe and attractive bathing waters for residents and tourists alike.
8. Water quality faces challenges in many areas of the south east marine plan, notably; diffuse pollution and management of waste water from the large catchment areas surrounding the Thames. All the above can also be exacerbated by periods of heavy rainfall.

Why is water quality important to the south east marine plan area?

9. The south east marine plan area relies on good water quality to support a number of sectors. There are several important shellfish beds in the marine plan area including:
 - native oyster, pacific oyster and manila clam - Swale, Thames and North Kent coast
 - blue mussel, native oyster, pacific oyster and manila clam - Clone to Blackwater
 - native oyster, pacific oyster and manila clam - Walton backwaters
10. As well as fishing and aquaculture the south east marine plan area has a high reliance on tourism and recreation activities many of which have a focus on the coast and the inshore area including bathing, kayaking and recreational boating. The south east generates the most revenue from leisure and small commercial marine activities than the other marine plan areas.

11. There are three River Basin Management Plan areas within the inshore south east marine plan area; The [Thames River Basin District](#), the [Anglian River Basin District](#) and the [South East River Basin District](#). Through these river basin management plans the Environment Agency maintain, review and keep an up to date register of the protected areas of water lying within each district. These include;
 - drinking water protected areas
 - shellfish waters (commercial shellfish harvesting)
 - bodies of water designated as recreational waters
 - nutrient sensitive areas
 - areas designated for the protection of habitats or species where water quality is an important factor in their protection
12. The [Thames River Basin District](#) covers over 16,200km². It encompasses all of Greater London and extends from north Oxfordshire southwards to Surrey and from Gloucester in the west to the Thames Estuary and parts of Kent in the east. In total over 15 million people live in the Thames district with many entering daily to work or visit. In addition to Greater London, other urban centres in the river basin district include Luton, Reading and Guildford.
13. The Thames river basin district has a rich diversity of wildlife and habitats, supporting many species of global and national importance from chalk streams such as the River Kennet to the Thames Estuary and salt marshes. The river basin district is mostly rural to the west and very urban to the east where it is dominated by Greater London. The economy is dominated by Greater London and the finance sector.
14. The [Anglian River Basin District](#) covers 27,900km² and extends from Lincolnshire in the north to Essex in the south and from Northamptonshire in the west to the east Anglian coast. In total over 7.1 million people live and work within the district and it includes the urban centres of Lincoln, Northampton, Milton Keynes and Chelmsford.
15. The Anglian river basin district has a rich diversity of wildlife and habitats, supporting many species of global and national importance. It is recognised as a rich region for wetland wildlife, with the Norfolk Broads being Britain's largest nationally protected wetland and is important for wintering wildfowl.
16. The [South East River Basin District](#) covers over 10,200km² and extends from Hampshire in the west to Kent in the east. In total over 3.5 million people live and work in the south east, which is densely populated and includes the major urban centres of Southampton, Portsmouth, Ashford, Brighton and Hove.
17. The South East river basin district has a rich diversity of wildlife and habitats, supporting many species of global and national importance. These include migratory salmon rivers, native white clawed crayfish, and estuaries and coastal waters important for shellfish, wintering wildfowl, breeding gulls and terns.
18. Water quality at areas recognised as bathing waters is important to human health. The [Environment Agency](#) classifies [designated bathing waters](#) help people to decide where is safe to swim. Using the Environment Agency classification [The Blue Flag and Seaside awards](#) by Keep Britain Tidy also inform the public about well managed beaches with good water quality. There are approximately 42 beaches in the south

east plan area that have 'designated bathing waters', 90% are classified as good or better. There are also 22 blue flag beaches ([Bathing water statistics](#)).

Who is this of interest to?

19. Any applicants preparing proposals that may have significant adverse impacts upon water quality, including upon habitats and species beneficial to water quality, in the south east marine plan area.
20. The environmental objectives summarised within River Basin Management Plans are legally binding under the [Water Environment \(Water Framework Directive\) \(England and Wales\) Regulations 2017](#). All public bodies must have regard to these objectives when making decisions that could affect the quality of the water environment. Including decision-making public authorities such as:
 - Marine Management Organisation
 - Environment Agency
 - Local planning authorities
 - Marine licensing authorities
 - Ports and Harbour authorities
 - The Planning Inspectorate
 - The Crown Estate
 - Inshore Fisheries and Conservation Authorities
 - Maritime and Coastguard Agency

How should this policy be applied?

21. All water bodies, including estuarine (transitional waters) up to 1 nautical mile from shore are protected under the [Water Environment \(Water Framework Directive\) \(England and Wales\) Regulations 2017](#) which requires that the licensed project or activity does not 'cause or contribute to deterioration in water body status' or 'jeopardise the water body achieving good status'.
22. Application of the [Water Environment \(Water Framework Directive\) \(England and Wales\) Regulations 2017](#) is enacted through [River Basin Management Plans](#) and the [catchment based approach](#) through catchment partnerships, as well as current water company controls and regulations. Other regulations should be taken into consideration, when appropriate, such as [Nitrate Vulnerable Zones](#).
23. Proposals should demonstrate they have considered any effects the proposal may have upon water quality or habitats and species beneficial to water quality in the catchment area. The [Catchment data explorer](#) can be used to identify which water body your activity is in and any linked water bodies it could affect. See also SE-WQ-2 for habitats and species beneficial to water quality.
24. Using guidance called [Clearing the Waters for All](#) applicants can assess the impact of the proposal on estuarine (transitional) and coastal waters for the [Water Environment \(Water Framework Directive\) \(England and Wales\) Regulations 2017](#). This assessment helps applicants and regulators to understand:
 - the impact your activity may have on the immediate water body and any linked water bodies
 - whether your activity complies with the [river basin management plan \(RBMP\)](#)

25. Proposals may be required to undertake any relevant assessments as required by [Water Environment \(Water Framework Directive\) \(England and Wales\) Regulations 2017](#) as part of obtaining regulatory consent for their activity. Being exempt from the need to undertake an assessment does not exempt proposals from policy SE-WQ-1.
26. Similarly, although a (Water Framework Directive) Assessment can contribute to demonstrating compliance with these policies, there may be impacts outside of the requirements of [Water Environment \(Water Framework Directive\) \(England and Wales\) Regulations 2017](#) that still need to be addressed to demonstrate compliance with policies SE-WQ-1.
27. Proposals should demonstrate how they will avoid, minimise, or mitigate significant adverse impacts upon water quality, or habitats and species beneficial to water quality during the construction period and throughout the lifetime of the proposal. Proposals cannot proceed to (b) unless they have first demonstrated why they cannot meet (a) etc.
28. The South East Marine Plan builds on existing measures, consistent with the [Marine Policy Statement](#) (2.5.13) and addresses water quality issues through ensuring proposals and public authorities consider impacts on water quality, including habitats and species that provide water filtration, nutrient assimilation and hazardous chemical sequestration services, and look for opportunities to improve water quality. The plan policies are not restricted to the inshore marine plan area as there is the potential for offshore sources to affect inshore water quality.
29. Examples of how to avoid, minimise or mitigate significant adverse impacts include but are not limited to:
- avoid – identify and avoid siting proposals at locations where adverse impacts might occur, ensuring outputs of proposal do not indirectly impact these locations
 - minimise - limiting the overall development footprint or the amount of time activities that disturb sediments occurs
 - mitigation - using bioremediation around infrastructure (such as mussel ropes or microalga mats) or creating compensatory habitat
30. Proposals and activities, such as recreation, not covered by the [Clearing the Waters for all](#) guidance have the potential to adversely impact water quality. Other guidance for such activities includes The Maritime and Coastguard Agency's [Pleasure Vessels – UK Regulations](#), and the Royal Yachting Association's '[The Green Blue](#)' [guidance on sewage and waste](#). Such impacts may be managed locally by byelaws.

Signposting

31. Existing measures which relate to, and may contribute to the achievement of this policy include:
- [Water Environment \(Water Framework Directive\) \(England and Wales\) Regulations 2017](#)
 - [River Basin Management Plans](#)
 - [Clearing the Waters for All](#) guidance on how to assess the impact of your activity in estuarine (transitional) and coastal waters for Water Environment (Water Framework Directive) (England and Wales) Regulations 2017

- [Catchment data explorer](#) to identify which water body your activity is in and any linked water bodies it could affect

32. Further information and guidance that may help in implementing the policy include:

- [Nitrate Vulnerable Zones](#)
- [Catchment based approach](#)
- Diffuse pollution - [The unseen threat to water quality](#)

Iteration 3 draft

Policy drafting template SE-WQ-2

HLMO	Living within environmental limits	Sub bullet(s)	Healthy marine and coastal habitats occur across their natural range and are able to support strong, biodiverse biological communities and the functioning of healthy, resilient and adaptable marine ecosystems.
Grouping	Water quality	Code	SE-WQ-2

Policy

SE-WQ-2

Proposals delivering improvements to water quality, or enhancing habitats and species which can be of benefit to water quality should be supported.

What is water quality?

1. Water quality is a measure of the condition of water and its suitability to sustain a range of uses for both biotic and human benefits. Good water quality is important in meeting the UK government's vision for clean, healthy, safe, productive and biologically diverse seas and oceans ([Marine Policy Statement](#)). Water quality in respect of the [Water Environment \(Water Framework Directive\) \(England and Wales\) Regulations 2017](#) is defined by specific biological, physico-chemical and hydromorphological criteria. The objectives of the [Water Environment \(Water Framework Directive\) \(England and Wales\) Regulations 2017](#) to protect and improve water quality, and set ambitious environmental goals and actions are implemented by [River Basin Management Plans](#). This policy seeks to complement these objectives and River Basin Management Plan implementation.

What causes poor water quality in the south east marine plan area?

2. Poor water quality refers to the presence of pollutants in water. These pollutants may include oil, sedimentation, sewage, nutrients, heavy metals. Water pollution can come from either diffuse (unlicensed sources) or point sources (regulated sources). In the south east inshore marine plan area there are issues for water pollution from industry, storm overflows and agricultural run-off.
3. Water quality is also affected by:
 - physical modifications to water ways
 - changes to the natural flow and level of water
 - negative effects of invasive non-native species
 - resuspension of sediment
 - extreme weather such as drought followed by intense rainfall
 - seasonal population variation

4. Developments within the marine area can contribute towards poor water quality. A number of policies in the South East Marine Plan support activities that could have adverse impacts upon water quality including (SE-INF-1, SE-CAB-1, SE-AGG-4, SE-DD-1).
5. The following aspects of any proposal needs to be considered:
 - water body (or bodies) potentially affected, including adjacent water bodies
 - duration of the activity
 - location
 - physical footprint with respect to the water body size
 - scale of impact
 - mitigation measures that could reduce any potentially adverse impact
 - presence of sensitive habitats
 - presence of contaminated sediments
6. The expected increase in the number and diversity of developments and marine users within the south east inshore marine plan area poses additional risk towards meeting Good status for ecological and chemical objectives in accordance with the [Water Environment \(Water Framework Directive\) \(England and Wales\) Regulations 2017](#) and Good Environmental Status in accordance with [The Marine Strategy Regulations 2010](#)

Where is water quality important in the south east marine plan area?

7. Water quality in the south east marine plan area is important in rivers, estuaries and coastal waters. These play a vital role in the areas economy through providing essential fish habitats and supporting commercial shell fisheries, some also provide safe and attractive bathing waters for residents and tourists.
8. Water quality faces challenges in many areas of the south east marine plan, notably; diffuse pollution and management of waste water from the large catchment areas surrounding the Thames. The above can be exacerbated by periods of heavy rainfall. There are a large number of designated shellfish waters in the area many of which are failing to comply with the shellfish waters assessment.

Why is water quality important to the south east marine plan area?

9. The south east marine plan area relies on good water quality to support a number of sectors. There are several important shellfish beds in the marine plan area including:
 - native oyster, pacific oyster and manila clam - Swale, Thames and North Kent coast
 - blue mussel, native oyster, pacific oyster and manila clam - Clone to Blackwater
 - native oyster, pacific oyster and manila clam - Walton backwaters
10. As well as fishing and aquaculture the south east marine plan area has a high reliance on tourism and recreation activities many of which have a focus on the coast and the inshore area including bathing, kayaking and recreational boating. The south east generates the most revenue from leisure and small commercial marine activities than the other marine plan areas.

What improves water quality in the south east marine plan area?

11. Water filtration, nutrient assimilation and hazardous chemical sequestration are ecosystem services essential to achieving and maintaining a long term improvement in water quality. Ecosystem services can be defined as 'the benefits provided by ecosystems that contribute to making human life both possible and worth living' ([UK National Ecosystem Assessment](#)).
12. Coastal saltmarsh habitats, reed beds and intertidal mudflats aid in reducing turbidity and sedimentation and in the longer term can remove through isolation hazardous chemicals and nutrients. Seagrass beds play a role in the removal of nitrogen and can reduce turbidity. There is also evidence that seagrasses are effective in the removal of hazardous chemicals from the water column. Filter feeding shellfish, such as blue mussels, filter water and absorb nutrients (particularly nitrogen) from the water column thereby improving water quality.
13. Ecosystem services fall into one of four sub categories depending on their contributions: provisioning, regulatory, cultural or supporting services. [Marine ecosystem services paper \(NECR088\)](#) identifies the types of habitats and species that can be of benefit to water quality by providing regulatory ecosystem services such as:
 - water filtration is the physical process of removing contaminants from water flowing through a system
 - nutrient assimilation is the result of actions to enhance and accelerate the ability of the ambient environment to accept nutrients (phosphorus and nitrogen) and still meet water quality standards
 - hazardous chemical sequestration is the capture and long-term storage of chemicals that might degrade water quality standards in line with reporting for the Water Framework Directive objectives
14. See also policy SE-CC-4.
15. [Tideway](#) is a national infrastructure project in the Thames. The primary purpose of the project is to reduce sewage overflows into the River Thames, delivering the core benefit of improved water quality. When complete Tideway will dramatically reduce storm overflows into the Thames, reduce sewage related debris and reduce lorry movements.

Who is this of interest to?

16. Any applicants when preparing proposals which may benefit water quality, including enhancing habitats and species beneficial to water quality, in the south east marine plan areas.
17. A [catchment based approach](#) to water quality encourages a stronger sense of shared responsibility across government, key stakeholder organisations, land managers, developers and the general public for actions and behaviours that will improve water quality. This policy is therefore also of interest to a wide range of public authorities and organisations.
18. The environmental objectives summarised within River Basin Management Plans are legally binding under the [Water Environment \(Water Framework Directive\) \(England](#)

[and Wales\) Regulations 2017](#). All public bodies must have regard to these objectives when making decisions that could affect the quality of the water environment. Including decision-making public authorities such as:

- Marine Management Organisation
- Environment Agency
- Local planning authorities
- Marine licensing authorities
- Ports and Harbour authorities
- The Planning Inspectorate
- The Crown Estate
- Inshore Fisheries and Conservation Authorities
- Maritime and Coastguard Agency

How should this policy be applied?

19. SE-WQ-2 aligns with the [Marine Policy Statement](#) (2.6.4.1). It complements actions of the [The Marine Strategy Regulations 2010](#) and the [Water Environment \(Water Framework Directive\) \(England and Wales\) Regulations 2017](#).
20. The South East Marine Plan builds on existing measures, consistent with the [Marine Policy Statement](#) (2.5.13) and addresses water quality issues through ensuring proposals consider impacts on water quality, including habitats and species that provide water filtration, nutrient assimilation and hazardous chemical sequestration services, and look for opportunities to improve water quality.
21. Proposals should demonstrate they have considered any effects the proposal may have upon water quality or habitats and species beneficial to water quality in accordance with SE--WQ-1.
22. Proposals can use the [Marine Information System](#) in scoping locations and habitats with the potential to provide relevant ecosystem services which benefit water quality. Several examples of these habitats are found in protected areas within the south east marine plan area and may require additional consideration. Relevant issues and threats for each habitat and species assemblage can be accessed via the statutory nature conservation bodies ([Marine Protected Areas in the UK](#)).
23. Proposals delivering improvements to water quality, will benefit water quality, or enhance habitats and species which can be of benefit to water quality, should be supported, when in alignment with other plan policies.
24. SE--WQ-2 aims to support activities that will improve water quality, or enhance habitats and species which benefit water quality. Activities, that may be achieved through steps such as voluntary measures, may include but are not limited to:
 - activities undertaken by water authorities such as waste water treatment and water infrastructure provision
 - habitat restoration works
 - provision of natural sediment settling areas
 - building in beneficial features as part of good design, for example that enhance habitat and species assemblages that provide regulatory services

- development of bioremediation sites such as those suggested by the [Marine Management Organisation's Environmental Remediation to Improve Water Quality report](#)
25. Proposals should note that identifying positive impacts or enhancement of an ecosystem service is not a substitute for avoidance, minimisation or mitigation of significant adverse impacts.
26. Early discussion with public authorities and [catchment partnerships](#) is advised when implementing SE--WQ-2 as it may help identify where best to direct resource to achieve the greatest benefit. Public authorities should assess proposals compliance with other relevant policy and legislation.
27. The Catchment Partnerships in the south east marine plan area are:
- Combined Essex
 - East Suffolk
 - Upper Lee
 - London
 - Roding and Ingrebourne
 - Darent
 - Medway
 - North Kent
 - Stour

Signposting

28. Existing measures which relate to, and may contribute to the achievement of this policy include:
- [Water Environment \(Water Framework Directive\) \(England and Wales\) Regulations 2017](#)
 - [River Basin Management Plans](#)
 - [The Marine Strategy Regulations 2010](#)
29. Further information and guidance that may help in implementing the policy include:
- [Clearing the Waters for All](#) guidance on How to assess the impact of your activity in estuarine (transitional) and coastal waters for Water Environment (Water Framework Directive) (England and Wales) Regulations 2017.
 - [Marine Management Organisation's Environmental Remediation to Improve Water Quality report](#)
 - [Catchment based approach](#)
 - [Catchment data explorer](#) to identify which water body your activity is in and any linked water bodies it could affect
 - [Marine ecosystem services paper \(NECR088\)](#)
 - [Coastal Blue Carbon in Practise](#)
 - [Capturing and conserving natural coastal carbon](#)

Policy drafting template SE-WQ-3

HLMO	Living within environmental limits	Sub bullet(s)	Healthy marine and coastal habitats occur across their natural range and are able to support strong, biodiverse biological communities and the functioning of healthy, resilient and adaptable marine ecosystems.
Grouping	Water quality	Code	SE-WQ-3

Policy

SE-WQ-3

Public authorities with functions capable of affecting water quality in the marine area should seek to enhance water quality where possible.

Public authorities with functions capable of affecting water quality in the marine area (including river catchments) must build in measures to, in order of preference: a) avoid b) minimise or c) mitigate significant adverse impacts to water quality in the marine area.

What is water quality?

1. Water quality is a measure of the condition of water and its suitability to sustain a range of uses for both biotic and human benefits. Good water quality is important in meeting the UK government's vision for clean, healthy, safe, productive and biologically diverse seas and oceans ([Marine Policy Statement](#)). Water quality in respect of the [Water Environment \(Water Framework Directive\) \(England and Wales\) Regulations 2017](#) is defined by specific biological, physico-chemical and hydromorphological criteria. Poor water quality refers to the presence of pollutants in water. These pollutants may include oil, sedimentation, sewage, nutrients, heavy metals.
2. Pollution can come from either diffuse (unlicensed sources) or point sources (regulated sources).

Point source water pollution	Diffuse water pollution
developments within the marine area	contaminated run-off from roads
waste water	drainage from housing estates
sewage treatment	accidental chemical and oil spills
storm overflows	agricultural run-off
industrial waste	pollution from abandoned mines
discharge from vessels (licensed)	discharge from vessels (unlicensed)
aggregate extraction	Micro plastics

Where is water quality important in the south east marine plan area?

3. Water quality in the south east marine plan area is important in rivers, estuaries and coastal waters. These play a vital role in the areas economy through providing essential fish habitats and supporting commercial shell fisheries, some also provide safe and attractive bathing waters for residents and tourists.
4. Water quality faces challenges in many areas of the south east marine plan, notably; diffuse pollution and management of waste water from the large catchment areas surrounding the Thames. The above can be exacerbated by periods of heavy rainfall. There are a large number of designated shellfish waters in the area many of which are failing to comply with the shellfish waters assessment.
5. The estuaries within the south east marine plan area are each important marine ecosystems in their own right. They host a range of nature conservation and landscape designations as well as industry, fisheries, anchorage and settlements attracting increasing tourism and recreation. Good water quality underpins these ecosystem services.
6. Water quality needs to be monitored at coastal locations popular for swimming to ensure that beach users are protected from pollution at 'designated bathing waters'.

What causes poor water quality in the south east marine plan area?

7. In the south east marine plan area there are issues for water pollution from industry, storm overflows and agricultural run-off.

Waste water from industry

8. Industries require an environmental permit from the [Environment Agency](#) to discharge liquid effluent or waste water to surface water or onto the ground.

Storm overflows

9. Storm overflows or combined sewer overflows play an important role in preventing flooding. During periods of heavy rainfall particularly following long dry spells, the sewer system can become full and back up. Permitted by the [Environment Agency](#) water companies can use storm overflows to allow a mixture of dilute untreated sewage and rain water to be re-directed into the sea. The [Environment Agency](#) encourages an urban pollution management and partnership approach to managing surface water in wet weather to limit pollution from storm overflows.

Diffuse pollution

10. Diffuse sources of pollution are pollutants from many small scale sources carried into water bodies by rainwater run-off from urban and rural land. The Environment Agency consider that diffuse pollution is now a bigger threat to river water quality than point source pollution ([the unseen threat to water quality](#)).

Diffuse water pollution includes:

- agricultural run-off (covered in more detail below)
- contaminated run-off from roads
- drainage from urban areas
- accidental chemical and oil spills that find their way into drainage systems

11. Taking a [catchment based approach](#) and education are key to addressing diffuse pollution.

Agricultural run-off

12. Agriculture is still a major source of water pollution in the UK ([25 Year Environment Plan](#)). The leading pollutants from agriculture and wastewater are sediment, chemicals, nitrate and phosphorus. Agriculture is currently the largest sector responsible for significant pollution events to water ([The state of the environment: water quality](#)). The Department for Environment, Food and Rural Affairs along with the Environment Agency introduced [Rules for farmers and land managers to prevent water pollution](#) to prevent manure, fertiliser and soil getting into watercourses.

13. Water quality is also affected by:

- physical modifications to water ways
- changes to the natural flow and level of water
- negative effects of invasive non-native species
- resuspension of sediment
- extreme weather such as dry spells followed by intense rainfall

14. The expected increase in the number and diversity of developments and marine users within the south east marine plan area poses additional risk towards meeting Good status for ecological and chemical objectives in accordance with the [Water Environment \(Water Framework Directive\) \(England and Wales\) Regulations 2017](#) and Good Environmental Status in accordance with [The Marine Strategy Regulations 2010](#).

Why is good water quality important to the south east marine plan area?

15. The south east marine plan area relies on good water quality to support a number of sectors. There are several important shellfish beds in the marine plan area including:

- native oyster, pacific oyster and manila clam - Swale, Thames and North Kent coast
- blue mussel, native oyster, pacific oyster and manila clam - Clone to Blackwater
- native oyster, pacific oyster and manila clam - Walton backwaters

16. As well as fishing and aquaculture the south east marine plan area has a high reliance on tourism and recreation activities many of which have a focus on the coast and the inshore area including bathing, kayaking and recreational boating. The south east generates the most revenue from leisure and small commercial marine activities than the other marine plan areas.

17. There are three River Basin Management Plan areas within the inshore south east marine plan area; The [Thames River Basin District](#), the [Anglian River Basin District](#) and the [South East River Basin District](#). Through these river basin management plans the Environment Agency maintain, review and keep an up to date register of the protected areas of water lying within each district. These include;

- drinking water protected areas
- shellfish waters (commercial shellfish harvesting)
- bodies of water designated as recreational waters
- nutrient sensitive areas

- areas designated for the protection of habitats or species where water quality is an important factor in their protection

18. The [Thames River Basin District](#) covers over 16,200km². It encompasses all of Greater London and extends from north Oxfordshire southwards to Surrey and from Gloucester in the west to the Thames Estuary and parts of Kent in the east.
19. In total over 15 million people live in the Thames district with many entering daily to work or visit. In addition to Greater London, other urban centres in the river basin district include Luton, Reading and Guildford.
20. The Thames river basin district has a rich diversity of wildlife and habitats, supporting many species of global and national importance from chalk streams such as the River Kennet to the Thames Estuary and salt marshes.
21. The river basin district is mostly rural to the west and very urban to the east where it is dominated by Greater London. The economy is dominated by Greater London and the finance sector.
22. The [Anglian River Basin District](#) covers 27,900km² and extends from Lincolnshire in the north to Essex in the south and from Northamptonshire in the west to the east Anglian coast. In total over 7.1 million people live and work within the district and it includes the urban centres of Lincoln, Northampton, Milton Keynes and Chelmsford.
23. The Anglian river basin district has a rich diversity of wildlife and habitats, supporting many species of global and national importance. It is recognised as a rich region for wetland wildlife, with the Norfolk Broads being Britain's largest nationally protected wetland and is important for wintering wildfowl.
24. The [South East River Basin District](#) covers over 10,200km² and extends from Hampshire in the west to Kent in the east. In total over 3.5 million people live and work in the south east, which is densely populated and includes the major urban centres of Southampton, Portsmouth, Ashford, Brighton and Hove.
25. The South East river basin district has a rich diversity of wildlife and habitats, supporting many species of global and national importance. These include migratory salmon rivers, native white clawed crayfish, and estuaries and coastal waters important for shellfish, wintering wildfowl, breeding gulls and terns.

Coastal bathing waters

26. Water quality at areas recognised as bathing waters is important to human health. The [Environment Agency](#) classifies [designated bathing waters](#) help people to decide where is safe to swim. Using the Environment Agency classification [The Blue Flag and Seaside awards](#) by Keep Britain Tidy also inform the public about well managed beaches with good water quality. There are approximately 42 beaches in the south east plan area that have 'designated bathing waters', 90% are classified as good or better. There are also 22 blue flag beaches ([Bathing water statistics](#)).

What improves water quality in the south east marine plan area?

27. There are natural and man-made ways to improve water quality. For example natural coastal habitats such as saltmarshes, reed beds, seagrass and intertidal mudflats all aid in the reduction of turbidity by increasing sedimentation and can remove hazardous chemicals and nutrients. Filter feeding shellfish, such as blue mussels, filter water and absorb nutrients (particularly nitrogen) from the water column in turn improving water quality.
28. Water filtration, nutrient assimilation and hazardous chemical sequestration are ecosystem services essential to achieving and maintaining a long term improvement in water quality. Ecosystem services can be defined as 'the benefits provided by ecosystems that contribute to making human life both possible and worth living' ([UK National Ecosystem Assessment](#)).
29. Other activities, that support improvements to water quality, may include but are not limited to:
- activities undertaken by water authorities such as waste water treatment and water infrastructure provision
 - habitat restoration works
 - provision of natural sediment settling areas
 - building in beneficial features as part of good design, for example that enhance habitat and species assemblages that provide regulatory services
 - development of bioremediation sites

Tideway

30. [Tideway](#) is a nationally significant infrastructure project in London. The primary purpose of the project is to reduce sewage overflows into the River Thames, delivering the core benefit of improved water quality. When complete Tideway will dramatically reduce storm overflows into the Thames and reduce sewage related debris.
31. All strategies and developments are best considered through a [catchment based approach](#). The Catchment Partnerships in the south east marine plan area are:
- Combined Essex
 - East Suffolk
 - Upper Lee
 - London
 - Roding and Ingrebourne
 - Darent
 - Medway
 - North Kent
 - Stour

Who is this of interest to?

32. The following government departments have decision making and regulatory functions that will apply this policy:
- Environment Agency – Environmental permits and exemptions, River Basin Management Plans
 - Natural England – catchment sensitive farming

- Ministry of Housing, Communities and Local Government – town and country planning
- Department for Business, Energy and Industrial Strategy – energy developments and associated development
- Department for Digital, Culture, Media and Sport – tourism and recreation
- Ministry of Defence

33. The environmental objectives summarised within River Basin Management Plans are legally binding under the [Water Environment \(Water Framework Directive\) \(England and Wales\) Regulations 2017](#). All public bodies must have regard to these objectives when making decisions that could affect the quality of the water environment.

34. Public authorities including:

- public authorities with waste, waste water or land management functions including but not limited to local authorities
- public authorities with strategic planning functions which enable activities that generate pollution that could impact upon water quality
- water companies with waste water management functions
- lead local flood authorities
- flood and coastal erosion risk management groups (FCERM)
- Port and harbour waste management functions – pollution from vessels
- Public authorities that develop River Basin Management Plans and other land management plans capable of affecting the marine area

How should this policy be applied?

35. SE-WQ-3 applies to the whole of the south east marine plan area and extends to functions that are carried out in adjacent marine plan areas which are capable of affecting water quality in the south east marine plan area.

36. Policy SE-WQ-3 aligns with the [Marine Policy Statement](#) (2.6.4.1 - 2.6.4.4) and the [Marine and Coastal Access Act](#) (section 58 (3)). It complements the actions of [The Marine Strategy Regulations 2010](#) and the [Water Environment \(Water Framework Directive\) \(England and Wales\) Regulations 2017](#).

37. Application of the [Water Environment \(Water Framework Directive\) \(England and Wales\) Regulations 2017](#) is enacted through [River Basin Management Plans](#) and the [catchment based approach](#) through catchment partnerships, as well as current water company controls and regulations.

38. This policy should be considered when developing strategic plans and programmes which may have an impact on water quality in the marine environment. This policy will also apply when making consent decisions for proposals which may have an impact on water quality in the marine environment. Collaborative working through catchment partnerships is the most effective way to apply this policy. The [Catchment data explorer](#) can be used to identify which water body your activity is in and any linked water bodies it could affect. Other regulations should be taken into consideration, when appropriate, such as [Nitrate Vulnerable Zones](#).

39. Examples of land-based infrastructure that should be considered include land-based handling and disposal facilities for refuse, waste water and sewage treatment. Also infrastructure to support recreational, residential and commercial boating and shipping activities is included. See also SE-INF-1, SE-ML-1 and SE-ML-2.
40. Public authorities must build in measures to avoid, minimise or mitigate any adverse impacts to the marine area caused by but not limited to:
1. increased inputs of nutrients, especially to nitrate vulnerable zones
 2. pollution
 3. agricultural run off
 4. plastics, including micro plastics (See SE-ML-1 and SE-ML-2)
41. Public authority functions should seek to avoid, minimise or mitigate these inputs where possible. Proposals should demonstrate that they will, in order of preference, avoid, minimise or mitigate adverse impacts to water quality - proposals cannot proceed to (b) unless they have first demonstrated why they cannot meet (a) etc.
42. Examples of how to avoid, minimise or mitigate significant adverse impacts include but are not limited to:
- avoid – avoid supporting functions which may lead to adverse impacts on water quality
- minimise – consider and plan for the impacts of all future developments upon water quality and include mitigation such as; sustainable drainage systems, natural waste water treatments, best available technology or collaborative working such as catchment sensitive farming
- mitigation - creating or enhancing compensatory habitat that provides an ecosystem service to improve water quality
43. Developments or activities which could be of benefit to water quality may include:
- sustainable drainage systems (SUDs)
 - improvements to sewage treatment works
 - natural flood management
 - minimising diffuse water pollution through applying [Rules for farmers and land managers to prevent water pollution](#)
 - collaborative working such as catchment sensitive farming
 - creating or enhancing compensatory habitats that improve water quality
44. The South East Marine Plan builds on existing measures, consistent with the [Marine Policy Statement](#) (2.5.13) and addresses water quality issues through ensuring public authorities consider impacts on water quality, including habitats and species that provide water filtration, nutrient assimilation and hazardous chemical sequestration services, and look for opportunities to improve water quality. The plan policies are not restricted to the inshore marine plan area as there is the potential for offshore sources to affect inshore water quality.

Signposting

45. Existing measures which relate to, and may contribute to the achievement of this policy include:
