West of Copeland MCZ

Feature Map

May 2019

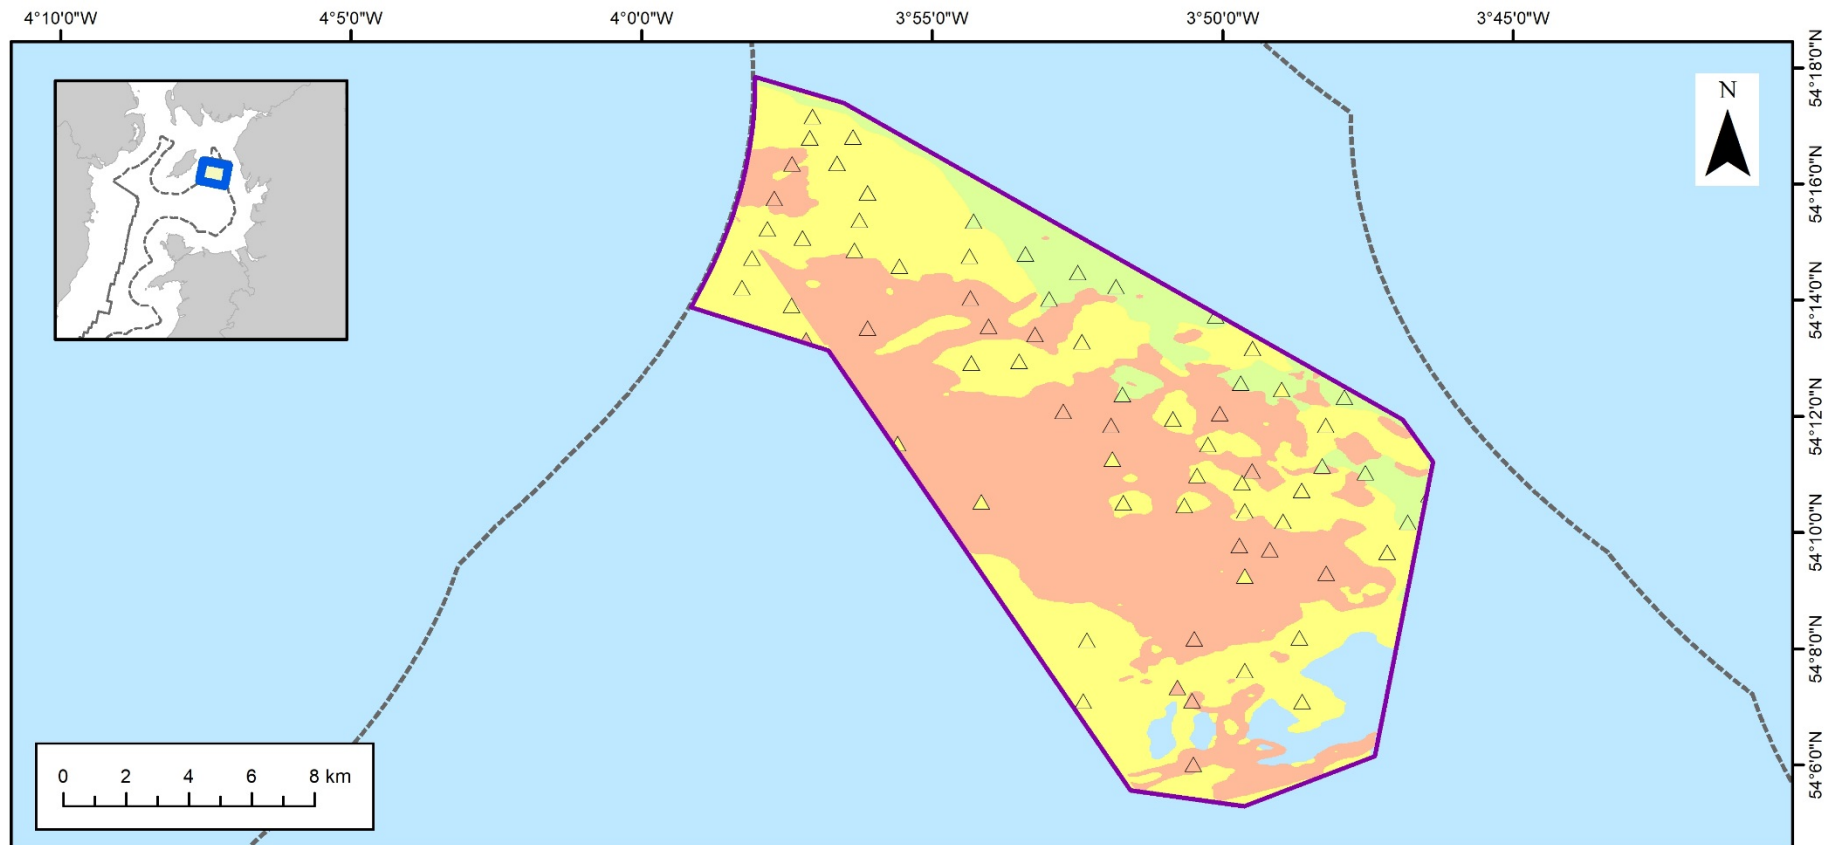

The following map shows where the features protected by this Marine Conservation Zone (MCZ) are located.

There is one map showing the broad-scale habitats and any features of conservation importance. Broad scale habitats represent habitats, and associated species that live on and in the habitat. Features of conservation importance are specific habitats and species that are known to be rare, threatened or declining in our seas.

A range of different types of surveys have been used to create these maps. The symbols on the map show where a sample has been taken, or where a feature has been recorded in a specific location. For many features, there is also shading to show the extent of the area in which the feature is found. For broad scale habitats, this is created from survey data and using mathematical models. For FOCI the extent is only shown where a survey has confirmed that the feature exists in this whole area. More detailed information on the techniques used and the features themselves can be found here:

<http://jncc.defra.gov.uk/page-7119>

Mapped data on features correct at the time of publishing, for the most up to date feature data please consult the JNCC website (<http://jncc.defra.gov.uk/page-4524>).

West of Copeland MCZ Feature Map

- MCZ Boundary
- Exclusive Economic Zone
- Territorial Sea Limit
- Land
- Sea

Features designated in 2019

- Subtidal coarse sediment
- Subtidal sand
- Subtidal mixed sediments

Groundtruthing sampling points, such as grab sampling, drop down video or core sampling

Shaded areas represent habitats mapped accordingly to data originating from surveys and mathematical models
