Syndromic Surveillance System: England

### 08 March 2021 Year: 2021 Week: 9 In This Issue: Key messages Data to: 07 March 2021 Key messages Ambulance COVID-19-like and breathing problems calls both continued to Syndromic indicators decrease during week 9 (figures 2 & 3). at a glance Data summary Indicators by Note: during the COVID-19 pandemic, patients with COVID-19 symptoms are generally syndrome: advised to initially access a COVID-19 test through the national COVID-19 testing programme. This is likely to result in lower numbers of patients accessing health advice as Total syndromic calls monitored through syndromic surveillance systems. Syndromic data should therefore be COVID-19-like interpreted with some caution and in the context of other COVID-19 monitoring data Breathing problems sources. Please see the notes for information about the NASS COVID-19-like syndromic indicator including important caveats around the interpretation of this indicator. Heat/cold exposure Falls/ back injuries -A Cold Watch System operates in England from 1 November to 31 March each year. As part of the Public Health traumatic England Cold Weather Plan for England the PHE Real-time Syndromic Surveillance Team will be monitoring the impact of cold weather on syndromic surveillance data during this period. Cardiac/ respiratory Cold weather alert level (current reporting week): Level 1/2 - Winter preparedness / Alert and readiness arrest http://www.metoffice.gov.uk/weather/uk/coldweatheralert/ Chest pain

## Syndromic indicators at a glance:

Indicator		Calls*	<b>Trend</b> <sup>†</sup>	Level <sup>‡</sup>
COVID-19-like		8,160	decreasing	-
Breathing problems		8,428	decreasing	below baseline levels
Heat/ cold exposure		42	no trend	similar to baseline levels
Falls/ back injuries - traumatic		12,365	decreasing	similar to baseline levels
Cardiac	Cardiac/ respiratory arrest	1,888	decreasing	similar to baseline levels
	Chest pain	8,856	decreasing	below baseline levels
Overdose/ ingestion/ poisoning		3,189	decreasing	below baseline levels
Unconscious/ passing out		5,507	decreasing	below baseline levels

\* Number of syndromic calls received by PHE in the reporting week

<sup>†</sup> Trend is defined as the overall activity over the last few weeks

<sup>‡</sup> Current activity in comparison to historical baselines, which have been constructed using data from 1 January 2018

Day	Trusts*	Week 9
Monday	10	13,581
Tuesday	10	12,766
Wednesday	10	13,117
Thursday	10	13,356
Friday	10	13,263
Saturday	10	12,870
Sunday	10	12,654
Total	(max) 10	91,607

Data summary:

Daily total syndromic counts and number of English ambulance trusts for which data is included in this bulletin.

## Ambulance

## Ambulance

08 March 2021	Year: 2021 Week: 9				
COVID-19-like ambulance calls:	• During March 2020 ambulance trusts started using a 'Pandemic/Epidemic/Outbreak' triage card to assess potential COVID-19 patients. Calls using this 'Pandemic' triage are now presented in this bulletin as ' <b>COVID-19-like</b> ' calls.				
	• When the Pandemic triage was introduced the number of syndromic indicator calls e.g. breathing problems decreased, reflecting the increased use of the pandemic triage.				
	• Please note that these ambulance calls are not an absolute count of COVID-19 cases assessed by ambulance trusts: not all ambulance trusts use the Pandemic triage card; other chief complaint categories and local codes are also used to triage potential COVID-19 patients.				
	• The 'COVID-19-like' call data presented in this bulletin should therefore be used to monitor trends in calls and not numbers.				
Introduction to charts:	• A 7-day moving average (adjusted for bank holidays) is overlaid on the daily data reported in each chart, unless specified.				
	• Baselines have been constructed using historical data since 1 January 2018 however they currently exclude data from 2020 due to the COVID-19 pandemic affecting ambulance services patient health care seeking behaviour.				
Notes and further information:	• National ambulance syndromic surveillance (NASS) call data are analysed by the Real- time Syndromic Surveillance Team (ReSST) on a daily basis to identify national and regional trends. A statistical algorithm underpins each syndromic surveillance system, routinely identifying activity that has increased significantly or is statistically significantly high for the time of year. Results from these daily analyses are assessed by the ReSST, along with analysis by age group, and anything deemed of public health importance is alerted by the team.				
	Coverage:				
	<ul> <li>Total syndromic calls includes all calls where the chief presenting complaint can be mapped to one of the syndromic indicators monitored by Public Health England.</li> </ul>				
	<ul> <li>Some indicators are not routinely presented in this report.</li> </ul>				
	• Total syndromic calls is lower than the total number of calls received by ambulance trusts.				
	Description of included NASS indicators:				
	• Breathing Problems: persons finding it difficult to breathe.				
	Heat/Cold Exposure: heat or cold exposure.				
	<ul> <li>Falls/Back Injuries - traumatic: persons falling or having a back injury.</li> </ul>				
	<ul> <li>Cardiac/Respiratory Arrest: persons who have stopped or have ineffective breathing or/and no pulse.</li> </ul>				
	Chest Pain: persons experiencing chest pain or chest discomfort.				
	Overdose/Ingestion/Poisoning: overdoses, ingestion of a substance or poisoning.				
Acknowledgements:	• Unconscious/Passing out: persons who are unconscious, not alert or fainting.				
	We would like to thank:				
	<ul> <li>North East, North West, Yorkshire, East Midlands, West Midlands, East of England, London, South East Coast, South Central, and South Western NHS Ambulance Trusts for submitting anonymised, daily data to the National Ambulance Syndromic Surveillance system.</li> </ul>				
	• The Association of Ambulance Chief Executives for their support in establishing NASS.
