

Hi

With reference to your SACN's draft report: "Lower carbohydrate diets for adults with type 2 diabetes". I have had a look at the search strategy provided in Annex 2, Table A2.1. When you update the searches please consider using the correct Emtree term for diabetes type 2 which is **non insulin dependent diabetes mellitus/** You have only included the MeSH subject heading which does not appear to work effectively in Embase.

Please see a screenshot below showing the difference in numbers between using the term you have provided and the correct Emtree term

The screenshot shows a table with two rows. Each row has a checkbox, a number, and a text description. The first row has an unchecked checkbox, the number '1', and the text 'Diabetes Mellitus, Type 2/'. The second row has an unchecked checkbox, the number '2', and the text 'non insulin dependent diabetes mellitus/'.

<input type="checkbox"/>	1	Diabetes Mellitus, Type 2/
<input type="checkbox"/>	2	non insulin dependent diabetes mellitus/

In addition, please also consider searching CENTRAL as part of The Cochrane Library as this may give additional references which are not on Medline or Embase.

Regards
Shelley
