

Expertise

Building a strong GSE community whose expertise is known and valued across government.

This theme is all about **identifying and promoting our expertise** across government, it's about building our profession, capturing our capabilities and promoting them to decision-makers.

We want to help more people in government **identify as a scientist or engineer** by helping them recognise there are a variety of ways you can use your analytical and problem-solving skills.

Go to the GSEP Strategy for a case study showcasing our military and civilian experts in the Ministry of Defence.

Increase the number of GSE Profession members by 40% for March 2022

Engage more members with a GSE Induction in December 2021

To do this, we are creating a **GSE lifecycle** which details the stages of S&E work within government. We will be developing case studies that highlight the invaluable science and engineering work that goes on in government - whether that's procuring or developing research, to building STEM capability.

We're working hard **to capture expertise** in a common way across departments - sign-up to the [GSE skills assessment tool](#) now to record your own technical capabilities!
