Cough

Week: 30

Key messages

Datato: 01 August 2021

During week 30, NHS 111 calls and online assessments for 'potential COVID-19' continued to decrease (figures 8 & 19).

Calls for diarrhoea and vomiting also decreased during week 30 (figures 9 & 10).

Baselines have been remodelled to account for changes due to COVID-19 and additional, new modelled lines have been added to the charts to represent expected levels if COVID-19 had not occurred.

Please note: due to technical issues, syndromic call numbers for the North West are currently incomplete and should be treated with caution. Please see <u>notes and caveats</u> section for more information about the 'potential COVID-19' and standard NHS 111 syndromic indicators.

A Heat-Health Watch system operates in England from 1 June to 15 September each year. As part of the Heatwave Plan for England, the PHE Real-time Syndromic Surveillance team will be routinely monitoring the public health impact of hot weather using syndromic surveillance data. <u>http://www.metoffice.gov.uk/weather/uk/heathealth/</u> Heat-health watch level (current reporting week): **Level 1: Summer preparedness**

Syndromic indicators at a glance:

	Indicator	Trend*	Level
	Cold/flu calls	no trend	above baseline levels
	Fever calls	decreasing	above baseline levels
	Cough calls	decreasing	above baseline levels
•	Loss of taste or smell calls	decreasing	*
	Difficulty breathing calls	no trend	above baseline levels
	Sore throat calls	decreasing	above baseline levels
	Potential COVID-19' calls	decreasing	*
	Diarrhoea calls	decreasing	above baseline levels
	Vomiting calls	decreasing	above baseline levels
nell	Eye problems calls	decreasing	similar to baseline levels
	Heat exposure or sunburn calls	decreasing	below baseline levels
9	Cold/flu online assessments	decreasing	above baseline levels
9	Fever online assessments	decreasing	below baseline levels
rts	Cough online assessments	decreasing	similar to baseline levels
	Loss of taste or smell online assessments	decreasing	*
	Difficulty breathing online asssessments	decreasing	similar to baseline levels
	'Potential COVID-19' online assessments	decreasing	*
S.	Heat exposure or sunburn online assessments	decreasing	*

03 August 2021	Year: 2021 Week: 30
Introduction to charts and caveats:	COVID-19 syndromic surveillance data: During the current COVID-19 pandemic, NHS 111 are triaging 'potential COVID-19' patients using new and evolving telephone and online systems. PHE are working with NHS 111 and NHS England to ensure that syndromic surveillance indicators monitor trends in these calls and online assessments. Any changes within the NHS 111 triaging systems will be reflected in our routine syndromic indicators and 'potential COVID-19' indicators.
	An individual may use both the NHS 111 Online and NHS 111 telephony services. Therefore, counts of individuals from the two services cannot be considered as distinct counts of individuals with potential COVID-19 symptoms.
	All NHS 111 syndromic trends should be interpreted with caution due to current national advice and guidance regarding access to health care services during the COVID-19 pandemic.
	NHS 111 'potential COVID-19' call data
	 The NHS 111 'potential COVID-19' syndromic indicator may not include all NHS 111 integrated urgent care service calls and therefore should be used to monitor trends in calls rather than numbers. The 'Potential COVID-19' syndromic indicator includes NHS 111 calls triaged using NHS
	Pathways and given a COVID-19 disposition (call outcome). These data are based on potential COVID-19 symptoms reported by callers and are not based on outcomes of tests for coronavirus. Prior to 11 May 2020 callers with COVID-19-like symptoms were assessed via COVID-19 Pathways. From 11 May 2020 callers who are assessed as having probable COVID-19 symptoms are triaged in symptom specific pathways which are included in our routine syndromic indicators.
	 NHS 111 'potential COVID-19' completed online assessment data The NHS 111 online data presented in this report are based on 'potential COVID-19' symptoms reported by the public via the NHS 111 Online service or the COVID-19 Response Centre and are not based on outcomes of tests for coronavirus. Any user that launches a COVID-19 online assessment may access the service multiple times and can change their answers and follow multiple journeys through the online system. The data presented are therefore completed online assessments rather than counts of individuals and should be used to monitor trends rather than numbers. From 11 June 2020 online users who are assessed as having probable COVID-19 symptoms will be triaged using symptom specific pathways.
	 Notes on charts Weekends and bank holidays are marked by vertical grey lines (bank holidays darker grey). Counts of calls and completed online assessments are shown with 7-day moving averages (adjusted for bank holidays) is overlaid on the daily data reported in each chart, unless specified. Where shown, baselines have been remodelled in June 2021 to represent seasonally expected levels of activity and are constructed from historical data since January 2018. They take account of any known substantial changes in data collection, population coverage or reporting practices. Baselines are reviewed on a regular basis. Where shown, orange dotted lines represent counter-factual models showing seasonally expected levels if COVID-19 had not occurred. NHS 111 call and Online data are analysed on a daily basis to identify national and
	regional trends. A statistical algorithm underpins each system, routinely identifying activity that has increased significantly or is statistically significantly high for the time of year. Results from these daily analyses are assessed by the ReSST, along with analysis by age group, and anything deemed of public health importance is alerted by the team.
