Volume 5: Appendix SV-002-0MA02
Sound, noise and vibration
MA02: Wimboldsley to Lostock Gralam
Baseline and construction sound, noise and vibration report

## 1 Introduction

- 1.1.1 This report is an appendix to the sound, noise and vibration assessment relating to the Wimboldsley to Lostock Gralam area (MA02). This appendix presents baseline and predicted construction sound, noise and vibration levels.
- 1.1.2 This appendix should be read in conjunction with:
  - Volume 2, Community Area reports;
  - Volume 3, Route-wide effects;
  - Volume 4, Off-route effects; and
  - Volume 5, Appendices.
- 1.1.3 There are three sound, noise and vibration appendices relevant to each community area, of which this should be considered the second. The first appendix contains an introduction to policy relevant to sound, noise and vibration and the assessment methodology, and can be found as Volume 5, Appendix SV-001-00000. This relates to all community areas. As the second appendix of the series, this report for MA02 provides the baseline and predicted levels as described above.
- 1.1.4 The third appendix is also specific to MA02, and provides detailed operational sound, noise and vibration levels, see Volume 5, Appendix SV-003-0MA02. This report should be read in conjunction with Map Series SV-03 in the Volume 5, Sound, noise and vibration Map Book.

# 2 Scope, assumptions and limitations

# 2.1 Regional and local policy guidance

- 2.1.1 The policy framework for sound, noise and vibration is set out in Volume 1, Section 8, and in Volume 5, Appendix SV-001-00000. As part of the engagement with local authorities where the Proposed Scheme would operate, information regarding any specific local planning guidance in respect of noise and vibration was requested. For MA02, the guidance within the following documents has been considered when applying the impact and significance criteria set out in the Environmental Impact Assessment Scope and Methodology Report (SMR), (see Volume 5: Appendix CT-001-00001):
  - the adopted Cheshire East Local Plan, which consists of a number of key documents which form part of the statutory development plan including: the Local Plan Strategy 2010 2030 (2017)<sup>1</sup>;
  - the saved policies from the previous local plans including the Congleton Borough Local Plan 1986 2001<sup>2</sup> and the Borough of Crewe and Nantwich Replacement Local Plan 2011<sup>3</sup>:
  - the adopted Cheshire West and Chester Local Plan (Part One) Strategic Policies<sup>4</sup>;
  - the adopted Cheshire West and Chester Local Plan Local Development Scheme<sup>5</sup>; and
  - the saved policies from the previous Local Plans including Chester District Local Plan<sup>6</sup> and Vale Royal<sup>7</sup>.

Volume 5: Appendix SV-002-0MA02
Sound, noise and vibration
MA02: Wimboldsley to Lostock Gralam
Baseline and construction sound, noise and vibration report

# 2.2 Engagement

- 2.2.1 Details of engagement on a route-wide basis with the local and county authorities' Environmental Health Practitioners are set out in Volume 1.
- 2.2.2 Meetings have been held with representatives of Cheshire East Council (CEC) and Cheshire West Council and Chester Council (CWCC)<sup>8</sup> regarding the approach taken to baseline monitoring within this area, the identification of noise and vibration sensitive receptors, the selection of assessment locations and the development of the mitigation to be included in the Proposed Scheme.
- 2.2.3 Changes suggested during these meetings have influenced the assessment locations used and the monitoring undertaken and are reported in this appendix. CEC and CWCC officers were also invited to attend baseline sound measurements in this area and witness the measurement procedures used.
- 2.2.4 Local engagement, prior to and through the working draft Environmental Statement report consultation provided opportunities for local stakeholders to suggest appropriate baseline sound monitoring locations, to confirm building uses and to review the draft list of non-residential properties to be considered in the assessment.

# 2.3 Methodology

2.3.1 The methodology used for the assessment of airborne sound, ground-borne sound and vibration impacts and the determination of significant effects is defined in the SMR. Further information is contained in Volume 5, Appendix SV-001-00000.

# 2.4 Assumptions

2.4.1 Route-wide assumptions are outlined in Volume 1, Section 8, and are further detailed in Volume 5, Appendix SV-001-00000. Local assumptions that apply to the assessment of construction sound noise and vibration within this area are set out in Volume 2, Community Area report: Wimboldsley to Lostock Gralam (MA02), Section 13.

<sup>&</sup>lt;sup>8</sup> Meetings held on 26 June 2018 with CWCC, 6 July 2018 with CEC, 28 June 2018 with TMBC and on 7 February 2018, 16 May 2018, 20 February 2019, 5 June 2019, 22 October 2020 and 7 July 2021 with the local and county authorities' Environmental Health Practitioners on a route wide basis.

Volume 5: Appendix SV-002-0MA02

MA02: Wimboldsley to Lostock Gralam
Baseline and construction sound, noise and vibration report

# 2.5 Limitations

2.5.1 The route-wide limitations and the approach adopted to ensure that they will not compromise the robust assessment of sound, noise and vibration are presented in Volume 5, Appendix SV-001-00000 and Volume 2.

Volume 5: Appendix SV-002-0MA02
Sound, noise and vibration
MA02: Wimboldsley to Lostock Gralam
Baseline and construction sound, noise and vibration report

# 3 Baseline

# 3.1 Existing acoustic environment

- 3.1.1 The Wimboldsley to Lostock Gralam area is characterised by a mix of small towns, villages, hamlets and isolated residential properties in a predominantly semi-rural setting. There are also some urban environments in the larger settlements of Northwich, Winsford and Middlewich.
- 3.1.2 The sound environment is generally dominated by local and distant road traffic, with trains, aircraft, local neighbourhood sources, natural and agricultural sounds also contributing.
- 3.1.3 There are several main roads within the Wimboldsley to Lostock Gralam area, including the A530 Nantwich Road that runs through Wimboldsley, Middlewich and Rudheath; the A54 Middlewich Road that runs through Winsford and Middlewich; the A533 Northwich Road/Bostock Road that runs through Middlewich, Bostock, Moulton, Davenham and Northwich; the A556 Chester Road/Shurlach Road that runs through Davenham, Northwich, Rudheath and Lostock Gralam; and the A559 Manchester Road that runs through Northwich, Lostock Gralam, Wincham and Marston and the M6 that runs east of Byley.
- 3.1.4 There are also a number of railways contributing to the sound environment in the Wimboldsley to Lostock Gralam area, including the West Coast Main Line (WCML) running in a south to north direction, the Sandbach to Northwich Line running in a south-east to northwest direction and the Mid-Cheshire Line running in a south-west to north-east direction.
- 3.1.5 Sound levels close to these main transport routes are high during the daytime and are generally lower during the night-time. Sound levels decrease with increasing distance from the main transportation routes. Manchester Airport restricts the operations permitted at night so that the aircraft noise levels are lower than during the daytime.
- 3.1.6 The communities of Wimboldsley and Occlestone Green are characterised by sound from the A530 Nantwich Road, local minor roads and to a lesser degree by the WCML to the west. Properties close to the A530 Nantwich Road typically experience daytime sound levels of 60dB 70dB and 55dB 65dB during the night-time. The properties set further back from the A530 Nantwich Road typically experience daytime sound levels of 45dB 55dB and 35dB 45dB during the night-time.
- 3.1.7 The community of Minshull Vernon is characterised by sound from the A530 Middlewich Road and the WCML. Properties close to the A530 Middlewich Road typically experience daytime sound levels of 60dB 70dB and 55dB 65dB at night-time. The properties set further back from the A530 Middlewich Road typically experience daytime sound levels of 50dB 55dB and 45dB 50dB during the night-time. Properties close to the WCML typically experience daytime and night-time sound levels of 60db 65dB. The properties set further back from the WCML typically experience daytime and night-time sound levels of 40dB 50dB.

Volume 5: Appendix SV-002-0MA02
Sound, noise and vibration
MA02: Wimboldsley to Lostock Gralam
Baseline and construction sound, noise and vibration report

- 3.1.8 The area between Wimboldsley and Stanthorne is generally of a rural nature to the south with an increasing build-up of both residential and commercial areas towards Winsford to the north-west and Middlewich to the north-east.
- 3.1.9 The communities of Clive, Stanthorne and the Newton Bank area to the west of Middlewich are characterised by sound from the A54 Middlewich Road, the A533 Northwich Road and the A530 Nantwich Road. The properties close to the A54 Middlewich Road, A533 Northwich Road and A530 Nantwich Road typically experience daytime sound levels of 55dB 70dB and 50dB 65dB during the night-time. Properties set further back from these road sources experience daytime sound levels of 45dB 55dB and 40dB 45dB during the night-time.
- 3.1.10 The communities of Bostock and Whatcroft are characterised by sound from the A533 Bostock Road, the A530 King Street and local roads. Properties close to the A533 Bostock Road and A530 King Street typically experience daytime sound levels of 55dB 65dB and 50dB 60dB during the night-time, depending on proximity. Properties set further back from these road sources experience daytime sound levels of 45dB 55dB and 40dB 45dB during the night-time.
- 3.1.11 The communities of Rudheath, Higher Shurlach and Broken Cross are characterised by sound from the A556 Chester Road, A530 King Street and local roads. Properties close to the A556 Chester Road and A530 King Street typically experience daytime sound levels of up to 65dB and up to 60dB during the night-time. The properties set further back from the A556 Chester Road typically experience daytime sound levels of 50dB 55dB and 45dB 50dB during the night-time.
- 3.1.12 The community of Lostock Green is characterised by sound from the A556 Chester Road to the west and Birches Lane. Properties close to the A556 Chester Road typically experience sound levels of up to 75dB during the daytime and 70dB during the night-time. The properties set further back from the A556 Chester Road typically experience daytime sound levels of 45dB 55dB and 40dB 55dB during the night-time.
- 3.1.13 The community of Lostock Gralam is characterised by sound from the A556 Chester Road to the east, the A559 Manchester Road running centrally through the area, the Mid-Cheshire Line and local roads. Properties close to the A556 Chester Road typically experience daytime sound levels of up to 65dB and 60dB during the night-time. The properties close to the Mid-Cheshire Line typically experience daytime sound levels of up to 55dB and up to 50dB during the night-time. Properties set further back from major transportation sources experience daytime sound levels of 45dB 60dB and 40dB 55dB during the night-time.
- 3.1.14 The community of properties on Ascol Drive is characterised by sound from the A556 Chester Road and A559 Manchester Road to the north-west. The properties facing the route of the Proposed Scheme typically experience sound levels of 55dB 70dB both during the daytime and during the night-time.

Volume 5: Appendix SV-002-0MA02
Sound, noise and vibration
MA02: Wimboldsley to Lostock Gralam
Baseline and construction sound, noise and vibration report

# 3.2 Existing baseline data collection methodology

3.2.1 The overall approach to baseline data collection for sound, noise and vibration is described in Volume 5, Appendix SV-001-00000. In summary, the approach to defining baseline levels includes a combination of sound monitoring and – where existing sound levels at assessment locations are dominated by transport sources which can be reliably modelled – sound modelling, verified using results from sound monitoring.

# 3.3 Existing baseline sound measurement locations

- 3.3.1 The assessment of impacts has been undertaken at assessment locations that are representative of a number of dwellings or other sensitive receptors. Baseline monitoring locations have been defined in order to provide representative sound levels at assessment locations within the study area as well as to verify the baseline sound model.
- 3.3.2 Baseline information has been gathered incrementally through successive rounds of field surveys focused on locations where likely significant effects are forecast.
- 3.3.3 Where measured baseline data are required to provide representative sound levels at assessment locations, areas have been defined within which the sound climate is influenced by the same sound sources. Within each of these areas, monitoring has been undertaken together with attended observations to assist in identifying the contributing sources to the sound climate at the measurement locations.
- 3.3.4 Where measurements, carried out at or close to assessment locations, have been used to assist in verifying the baseline sound model, they are identified in Table 1 along with the modelled baseline for the relevant assessment location.
- 3.3.5 Within MA02, 13 baseline measurement locations have been defined. The measurement locations are shown on the detailed maps in Volume 5, Sound, noise and vibration Map Book: Map Series SV-02 and SV-03. These measurement locations have been classified as follows:
  - twelve long-term measurements unattended measurements of several days' duration; and
  - one short-term measurements unattended measurements typically of 24 hours' duration and attended measurements typically of several hours.
- 3.3.6 An additional 33 verification measurements have been carried out, typically close to modelled sound sources and over durations of three hours (attended) or 24 hours (unattended), to assist in verifying the baseline sound model.

Volume 5: Appendix SV-002-0MA02
Sound, noise and vibration
MA02: Wimboldsley to Lostock Gralam
Baseline and construction sound, noise and vibration report

# 3.4 Existing baseline sound modelling

- 3.4.1 Baseline sound levels have been modelled where existing sound levels at assessment locations are dominated by transport sources which can be reliably modelled.

  Methodologies from the Calculation of Road Traffic Noise<sup>9</sup> and the Calculation of Railway Noise<sup>10</sup> have been used to predict baseline levels of airborne sound from road traffic and railways respectively. The methods use input data such as traffic flows and speed to predict sound levels. As described previously, verification measurements have been carried out to assist in verifying the baseline sound model.
- 3.4.2 Within the Wimboldsley to Lostock Gralam area, noise from all major roads including the A530 Nantwich Road, the A54 Middlewich Road, the A533 Bostock Road, the A556 Chester Road and the A559 Manchester Road, approximately 20 other roads, the WCML, the Sandbach to Northwich Line and the Mid-Cheshire Line have been modelled.

# 3.5 Future baseline methodology

## Construction

3.5.1 The assessment of noise from construction activities assumes a future construction baseline year of 2025, which represents the period immediately prior to the start of the construction period. As a reasonable worst case, it has been assumed that no change in baseline sound levels will occur between the existing baseline year of 2018 and the future construction baseline year of 2025.

# **Operation**

- 3.5.2 Changes in road and rail traffic between 2018 and 2038 may result in changes in baseline sound levels at receptors. For modelled transportation sources, future baseline sound levels for operation (2038) have been predicted, based on, for example, expected changes in road traffic flow, composition, speed, and in some cases road surface using the methodology from the Calculation of Road Traffic Noise.
- 3.5.3 Changes in noise level as a result of changes in road traffic flow, composition and speed are normally small. Roads in Important Areas identified in Department for Environment, Food &

<sup>&</sup>lt;sup>9</sup> Department of Transport Welsh Office (1988), Calculation of Road Traffic Noise.

<sup>&</sup>lt;sup>10</sup> Department of Transport (1995), Calculation of Railway Noise.

Volume 5: Appendix SV-002-0MA02
Sound, noise and vibration
MA02: Wimboldsley to Lostock Gralam
Baseline and construction sound, noise and vibration report

Rural Affairs' (Defra) Noise Action Plans<sup>11</sup> and trunk roads, which are likely to be resurfaced under future routine maintenance programmes, have been assumed to have a low noise surface in 2038. Assuming a low noise surface will result in a lower baseline sound level compared with other road surface types. This is conservative as a lower baseline will have the effect of increasing predicted adverse airborne noise effects during operation.

3.5.4 For 2038, airborne noise levels from railways in Important Areas identified in Defra's Noise Action Plans are assumed, on a precautionary basis, to be controlled to a level of 65dB L<sub>Aeq,18hour</sub>, where they are predicted to exceed this level. This is the lowest level of airborne railway noise where further mitigation would be considered within an Important Area.

## 3.6 Baseline sound levels

- 3.6.1 Baseline sound levels have been ascertained for each assessment location within this area. In some cases, they include adjustments to account for changes in baseline sound sources between the date of the existing baseline sound levels and the year of opening of the Proposed Scheme (2038). Further detail regarding the future baseline methodology is provided in Section 3.5. Baseline sound levels are presented in terms of the following key sound indicators:
  - baseline levels used for the operational sound assessment:
    - L<sub>pAeq,16hour</sub> daytime (07:00 23:00) sound pressure level;
    - L<sub>pAeq,8hour</sub> night-time (23:00 07:00) sound pressure level;
    - arithmetic average of L<sub>pAFmax,5min</sub> night-time sound pressure level; and
    - highest L<sub>pAFmax,5min</sub> night-time sound pressure level.
  - baseline levels used for the construction sound assessment:
    - daytime  $L_{pAeq}$  sound pressure level (Monday to Friday 07:00 19:00; Saturday 07:00 13:00);
    - evening/weekend  $L_{pAeq}$  sound pressure level (Monday to Friday 19:00 23:00, Saturday 13:00 23:00 and Sunday 07:00 23:00); and
    - night-time L<sub>pAeq</sub> sound pressure level (Monday to Sunday 23:00 07:00).
- 3.6.2 These values are presented in Table 1. All values are free-field. The data source coding included within this table details how the baseline sound levels allocated to each assessment

## Table 2: Data source coding key

| Code | Data source type   |
|------|--|
| 1    | Long-term measurement location (typically seven days).   |
| 2    | Short-term (typically unattended 24 hours or attended measurements of several hours).  |
| 3    | Specific road traffic validated prediction.  |
| 4    | Specific rail traffic validated prediction.  |
| 5    | Specific combined road and rail traffic validated prediction.  |
| 6    | Levels adopted from nearby assessment location.  |
| 7    | Predictions from other sources (e.g. Defra noise maps).  |
| Code | Corrections applied  |
| А    | Data from above source applied directly.   |
| В    | Correction applied based upon location of assessment location.   |
| С    | Minimum level cut-off applied.   |
| Code | Distance from measurement  |
| i    | Data applied from a measurement / prediction at or very close to the assessment location.  |
| ii   | Data applied from a local measurement location at a greater distance but noted to have equivalent acoustic climate.  |
| iii  | Data applied from a distant measurement location where sound levels would be expected to be similar.   |
| Code | Uncertainty  |
| а    | Data are considered highly representative of the prevailing sound climate.   |
| b    | Data are considered representative of the prevailing sound climate, but uncertainties and/or variations in measured levels indicate that there may be a higher degree of uncertainty than for (a). |
| С    | Data are considered to be an estimate of the sound climate due to assumptions made.  |

Baseline and construction sound, noise and vibration report

## 4 Construction

# 4.1 Evaluation of impacts and effects

- 4.1.1 This appendix provides a quantitative assessment of construction noise and vibration impacts/effects and a qualitative assessment of likely significant effects, based on the impacts/effects identified and other local context information consistent with the scope and methodology defined for the Proposed Scheme.
- 4.1.2 Indirect effects arising from temporary changes in traffic patterns on the existing road network as a consequence of constructing the Proposed Scheme are reported where they are likely to occur within the study area as defined in Volume 5, Appendix SV-001-00000.
- 4.1.3 In undertaking the assessment of sound, noise and vibration, consistent with the Environmental Impact Assessment Directive<sup>14</sup> and planning practice on noise<sup>15</sup> a differentiation between impacts, effects, adverse effects and significant effects is made. Further information is provided in Volume 5, Appendix SV-001-00000.
- 4.1.4 The assessment of impacts and effects has been undertaken at assessment locations that are representative of a number of dwellings or other sensitive receptors. The construction assessment locations employed in this assessment are presented on Volume 5, Sound, noise and vibration Map Book: Map Series SV-03.
- 4.1.5 Baseline sound level data have been collected at locations representative of the airborne sound-sensitive receptors and presented in Table 1.

# 4.2 Effects during construction

## Introduction

4.2.1 The assessment is reported first for ground-borne sound and vibration and then for airborne sound. Under each of these headings, the results of the identification of impacts, effects and significant effects are presented. The significant effects and the evidence used to support these conclusions are presented in Volume 2, Community Area report: Wimboldsley to Lostock Gralam (MAO2), Section 13.

<sup>&</sup>lt;sup>14</sup> Directive 85/337/EEC, as amended by 97/11/EC, 2003/35/EC, 2011/92/EC and 2014/52/EU ('the EIA Directive') of the European Parliament and of the Council of 13 December 2011 on the assessment of the effects of certain public and private projects on the environment. Strasbourg, European Parliament and European Council.

<sup>&</sup>lt;sup>15</sup> Ministry of Housing, Communities & Local Government (2019), *National Planning Practice Guidance – Noise*. Available online at: <a href="https://www.gov.uk/guidance/noise--2">https://www.gov.uk/guidance/noise--2</a>.

Volume 5: Appendix SV-002-0MA02
Sound, noise and vibration
MA02: Wimboldsley to Lostock Gralam
Baseline and construction sound, noise and vibration report

# **Avoidance and mitigation measures**

4.2.2 These are set out in, Volume 2, Community Area report: Wimboldsley to Lostock Gralam (MA02), Section 13.

# **Identification of impacts and effects**

- 4.2.3 Assessment locations defined for the quantitative assessment of impacts are shown on Volume 5, Sound, noise and vibration Map Book: Map Series SV-03.
- 4.2.4 For each assessment location, the assessment results are presented in Table 4. Explanation of the information in Table 4 to Table 6 is provided in Volume 5: Appendix SV-001-00000, with the following additional notes in Table 3.

Table 3: Explanatory notes for assessment results - direct construction effects

| Symbol  | Explanation   |
|---------|---|
|         | Where the significant effect column is highlighted in pink, then a significant effect is identified at the referenced residential community area.   |
|         | For residential receptors yellow denotes a minor ground-borne vibration impact.   |
|         | For residential receptors orange denotes a moderate ground-borne vibration impact.  |
|         | For residential receptors red denotes a major ground-borne vibration impact.  |
| *       | For residential receptors this indicates a potentially significant effect where the quantitative impact methodology has identified an impact at this receptor which, based upon further qualitative receptor information, (see assessment text) does not give rise to a significant effect.  For non-residential receptors this indicates the predicted noise levels are above screening criteria which, based upon further qualitative receptor information, (see assessment text) does not give rise to a significant effect. |
| ~       | When considered under the significance criteria set out in Volume 5: Appendix SV-001-00000, Annex A, Section 1.3, these adverse effects are not considered to be significant on a community basis.  |
| A       | For residential Assessment Locations (AL) - Construction sound or vibration levels from the Proposed Scheme exceed Lowest Observed Adverse Effect Level (LOAEL): the significance criteria set out in Volume 5: Appendix SV-001-00000, Annex A, Section 1.3 are considered when establishing significant effects.  For non-residential AL and external amenity spaces - Construction sound or vibration levels from the   |
|         | Proposed Scheme exceed the screening criteria in the SMR Section 18.  |
| S       | Sound levels from the Proposed Scheme exceed Significant Observed Adverse Effect Level (SOAEL): noise insulation (or temporary rehousing at higher noise levels) therefore provided.  |
| NA      | Sound or vibration levels from the Proposed Scheme do not exceed LOAEL, therefore generally no adverse effect.  |
| R       | Type of receptor – residential.   |
| A1 – A4 | Type of receptor (airborne sound) - (A1) large and small auditoria; concert halls, sound recording and broadcast studios and theatres, (A2) places of meeting for religious worship, courts, cinemas, lecture theatres, museums and small auditoria or halls, (A3) schools; colleges; hospitals, hotels and libraries, (A4) offices and amenity spaces.   |
| V1 - V4 | Type of receptor (ground-borne vibration) – (V1) vibration sensitive research and manufacturing; hospitals with vibration sensitive equipment/operations; universities with vibration sensitive   |

Volume 5: Appendix SV-002-0MA02
Sound, noise and vibration
MA02: Wimboldsley to Lostock Gralam
Baseline and construction sound, noise and vibration report

| Symbol   | Explanation   |
|----------|---|
|          | research equipment/operations, (V2) hotels, hospital wards and education dormitories, (V3) offices, schools and places of worship, (V4) workshops.  |
| Т        | Receptor design – typical.  |
| SP       | Receptor design – special.  |
| +        | The use and sensitivity of this non-residential receptor or land use is very sensitive to noise and has been included in the detailed assessment (presented in Volume 2) where there is a change less than 3dB. In each case specific information is presented in an associated footnote.   |
| \$       | The impact methodology for non-residential receptors includes a screening criterion for A2 building use of $50dBL_{pAeq,07:00-23:00}$ , A3 building use of $50dBL_{pAeq,07:00-23:00}$ , and $45dBL_{pAeq,23:00-07:00}$ and for A4 building. use $55dBL_{pAeq,07:00-23:00}$ (except for A4 buildings containing lower sensitivity offices, in which case the relevant A and B categories from the BS5228 ABC method will be used to assess the noise impact). At the receptor denoted, the screening criteria is met but a change of 3dB or greater has not been identified and therefore no impact is identified. Further information is provided in Volume 5: Appendix SV-001-00000. |
| Н        | Existing environment – high existing airborne ambient noise levels, day >75dB, evening >65dB or night >55dBL <sub>pAeq</sub> at the façade.   |
| L        | Existing environment – low existing airborne ambient noise levels, day and evening $\leq$ 45dB, or night $\leq$ 35dBL <sub>pAeq</sub> at the façade.  |
| D,E,N    | Impact duration (months) – duration of impact during the day (D), evening (E) or night (N).   |
| O, CT, V | Combined Impact: If noise or vibration impacts from other construction activities occur at this location: onsite activities (O), off-site construction traffic activities (CT), or construction vibration (V).  |
| NI       | Mitigation effect - identified as likely to qualify for noise insulation under the draft Code of Construction Practice (CoCP) Volume 5: Appendix CT-002-00000.  |
| TR       | Mitigation effect - identified as likely to qualify for temporary rehousing under the draft CoCP.   |

## **Ground-borne sound and vibration**

- 4.2.5 Activities associated with the construction phases of the Proposed Scheme will generate ground-borne sound and vibration. The assessment of the likely impacts and significant effects as a result of the construction noise has considered the effects on:
  - residential receptors, both as individual dwellings and communities; and
  - non-residential receptors.
- 4.2.6 The results, impact criteria and significance criteria for the assessment of the Proposed Scheme at residential and non-residential receptors are presented in Table 4. Explanation of the information within Table 4 is provided in Volume 5, Appendix SV-001-00000, with the additional notes presented in Table 3.

Baseline and construction sound, noise and vibration report

# Airborne sound: direct impacts and effects

- 4.2.7 Activities associated with the construction phases of the Proposed Scheme will generate airborne noise. The assessment of the likely impacts and significant effects as a result of the construction noise has considered the effects on:
  - residential receptors, both as individual dwellings and communities; and
  - non-residential receptors, including quiet areas.
- 4.2.8 For each type of receptor, the typical and highest monthly L<sub>Aeq,T</sub> noise levels from construction activities have been calculated at the façade of all assessment locations. This is subject to the screening distances identified and based upon supplied plant information from engineers.
- 4.2.9 The results, impact criteria and significance criteria for the assessment of the Proposed Scheme at residential and non-residential receptors are presented in Table 5 and Table 6 respectively. Explanation of the information within Table 5 and Table 6 is provided in Volume 5, Appendix SV-001-00000, with the additional notes presented in Table 3.

Sound, noise and vibration
MA02: Wimboldsley to Lostock Gralam
Baseline and construction sound, noise and vibration report

## Airborne sound: indirect effects

- 4.2.10 Construction road traffic associated with the construction phases of the Proposed Scheme would generate airborne noise. Based upon traffic information for the Proposed Scheme, the change in traffic noise level at a reference distance of 10m from the edge of the nearside carriageway for a given road has been predicted. Data have been produced for a typical month during the construction period and for a worst-case month during the construction period. The results for potentially significant road links are presented in Table 8.
- 4.2.11 Explanation of the information within Table 8 is provided in Volume 5, Appendix SV- 001- 00000, with the following additional notes in Table 7.

Table 7: Explanatory notes for assessment results - indirect construction effects

| Colour   | Explanation   |
|----------|---|
|          | Where the significant effect column is highlighted, then a significant effect is identified on nearby communities.  |
|          | Yellow denotes a minor impact – a change is of $\ge$ 3dB – <5dB, or $\ge$ 1dB – <3dB where a high existing sound level is identified.   |
|          | Orange denotes a moderate impact – a change is of ≥5dB – <10dB, or ≥3dB – <5dB where a high existing sound level is identified.   |
|          | Red denotes a major impact – a change is of ≥10dB, or ≥5dB where a high existing sound level is identified.   |
| ~        | When considered under the significance criteria set out in Volume 5: Appendix SV-001-00000, Annex A, Section 1.3, these adverse effects are not considered to be significant on a community basis.                          |
| *        | For non-residential receptors this indicates the predicted noise levels are above screening criteria which, based upon further qualitative receptor information, (see footnote) does not give rise to a significant effect. |
| O, CT, V | Combined Impact: If noise or vibration impacts from other construction activities occur at this location: onsite activities (O), off-site construction traffic activities (CT), or construction Vibration (V).              |
| R, NR    | Number of properties affected (approx.) – identified by type of receptor: R: total number of residential (total number of residential in community). NR: total number of non-residential.                                   |

# Airborne sound levels used in other assessments

4.2.12 The construction sound results contained in this document have been used by other disciplines, namely agriculture, historic environment, landscape and visual, communities and socio economics, in their assessments. This includes the information in Table 5 and Table 6.

Locations of interest to these other disciplines which may not appear in Table 5 or Table 6 are presented in Table 9.
