#### **INTRODUCTION**

A survey was requested by Defence Infrastructure Organisation (DIO) as part of the on-going management and monitoring of heritage assets within the Merrivale Training Area (MTA). The purpose of the work is to provide an updated condition assessment for all known archaeological sites within Merrivale TA. This includes scheduled monuments (SMs) and non-scheduled sites recorded in the Dartmoor HER and the National Monument Record (NMR), but excludes listed buildings. Previous condition surveys were completed in MTA in 2010 by Probert, and 2017-18 (Newman 2018). The original baseline survey was completed by the present author in 2005 (English Heritage 2005). The survey presented below was undertaken in November 2021 to January 2022.

#### The Survey Area (Fig. 1)

Merrivale Training Area is the second largest of the Dartmoor training areas (DTAs), and covers 3319ha within the central western sector of Dartmoor National Park. It is one of three Dartmoor Training Areas where live firing is practised. The boundary is mostly arbitrary, only adhering to a few natural landmarks, but the TA incorporates the source and upper valleys of the Rivers Walkham and Cowsic as well as the head regions of the West River Dart, South Tavy and Colly Brook. The terrain includes deep valleys and high tors with granite outcrops, but also several areas of bog, especially near the river sources. The majority of the land falls within the Forest of Dartmoor, though the western zone is within Peter Tavy parish, and a small portion to the south-west comes under Walkhampton parish.

The majority of the TA is common land on open moorland, also designated as Access Land, where the public is permitted to roam outside of designated firing days, though a small area on the western edge near Wapsworthy is enclosed pasture. Vehicular access to the area is restricted to a single trackway to Whittor, and a second track to Great Mis Tor. Neither is available for use by the public, other than on foot, at any time.

Although in terms of area, Merrivale is the second largest of the Dartmoor TAs, it contains a relatively low number of heritage assets, compared with the smaller ranges, whilst, together with Okehampton, it has a concentration of approximately one scheduled monument (SMs) per square kilometer, although of the total archaeological sites recorded within Merrivale, 30% are SMs.

Fig 1. Dartmoor National Park showing DIO Dartmoor Training Area, with Merrivale TA highlighted.

#### Methodology

The essential methodology of the condition survey has remained unaltered since the first in 2010 and requires a field inspection and an summary of condition for all the heritage assets listed in previous surveys. Any deterioration or improvement in condition is noted and if required, recommendations are made as to any remedial actions necessary. A photographic record for each heritage asset acts as a visual means of monitoring site condition over time and digital photographs from each survey are archived by DIO for back reference.

The current survey has made use of the 2005 EH baseline survey of Merrivale TA (on which the first condition appraisal was based) as a means of establishing location and extent of the archaeological sites recorded in that report (Fig. 2). Also, with the availability of lidar and satellite imagery, it has been possible to modify slightly the polygons surrounding some areas of the tin streamworks on the high moor. This was first carried out in 2017-18 and some minor revision has been incorporated in to this 2022 report and appended GIS data.

Since the 2005 survey, only three additional sites have been added to the baseline list. Of the 121 heritage assets for which records now exist, 36 form the whole or part of scheduled monuments (SMs), or they are within the protected zone of a SM. No addition SMs have been added by Historic England within MTA since the 2017-18 assessment.

The 2022 condition survey was conducted using pro-forma sheets (in digital format) to record field observations, with the results, plus information on the images, collated into an Excel spreadsheet. Condition photographs are filed using the monument numbers, enabling cross-referencing with the spread sheet. Where multiple images are provided for a single site, they are appended with the letter a, b, etc. Location and approximate extent of each monuments is presented in GIS polygon format (.shp). Each entity in the GIS file also has a short descriptive field. The results are summarised in this report, which also highlights any issues that may require conservation action.

#### LEGACY CONDITION AND MONUMENT TYPE

#### (NB: The following discussion is based on part the 2018 report, which has required only minor amendments)

Condition of field monuments is to some extent dependent on their age. A prehistoric site, which may be up to 5000 years old at Merrivale, may have less visible fabric but has had much longer to decline and stabilise than a ruined 20th-century military earthwork or structure, whereas the condition of modern sites can decline rapidly if unprotected and subject to neglect and abuse. Clearly, a consistent approach when applying a condition category is difficult for an assemblage of monuments with such a diversity of ages. Allowances therefore have to be made for the legacy condition, which is described below for each category. For the purposes of this survey the *Condition* terms (good, fair, poor) have to take this into account but are still somewhat arbitrary depending on the observer. However, the *Stability and Change* record for each monument is more accurately gauged and is related solely to damage, threats or other management issues visible at the time of inspection, and having occurred since the previous condition inspection. These observations can help establish whether the site's status has declined, improved or remains static since previous inspections.

The archaeology of Merrivale Training Area can be broken down into nine distinct categories, based on chronological period and site types:

Prehistoric burial – cairns Prehistoric ritual – stone circles, stone rows, tor enclosure Prehistoric settlement – hut circles, enclosed settlements and reaves Medieval agriculture – field system, cultivation ridges Medieval/post-medieval settlements Medieval/ post medieval industrial – tinworking, charcoal making Nineteenth-century tin mining Miscellaneous (mostly post-medieval) – boundary stones and large stone artefacts This is a fairly typical assemblage of archaeological site types found on Dartmoor's moorlands, although the area is well endowed with prehistoric hut settlements and two particularly fine isolated medieval farmsteads. The unusual feature of Whittor, a probable Neolithic enclosure, is a particularly significant heritage asset. Although, prehistoric reaves are present in this area they are not as numerous as some other parts of Dartmoor. The early tin industry is well represented with many hectares of tin streamworks following river valleys, and several pit-type workings. Small rectangular structures known as tinners' lodges, but usually recorded as tinners' huts, may be found nestling amongst the remains of the streamworks. The area contains one tin blowing, or smelting house and the remains of a 19th-century tin mine lie beside the River Walkham.

#### Ritual

Langstone stone circle (439606) is one of only 14 certain stone circles to survive on Dartmoor. The site was restored in 1894 (Newman 2003), though some stones have become damaged since that time, but it is an impressive and significant monument, dating probably from the early 2nd millennium BC. A total of three stone rows are known in Merrivale TA: one at Langstone Moor (439578) not far north of the circle has a large standing stone at its southern terminal known as the Longstone. Others rows are found on Conies Down Tor (439578) and Cut Hill (1405946). A single standing stone named Beardown Man (439571), is sited near Devil's Tor. The stone rows are likely to be among the earliest extant Bronze Age monuments within the TA, dating possibly from as early as the third millennium BC. As with all orthostatic monuments there is a risk of individual stones being toppled, usually through a combination of erosion around the base and use by animals as rubbing posts. Although the stone circle was restored, it is unlikely these particular stone rows were ever subject to antiquarian interference.

A large, stony tor enclosure on Whittor (439744) at the far west of the TA is believed to have Neolithic origins and is one of only two such examples known on Dartmoor. Its age and rarity make it a particularly sensitive site, but its robust fabric and tor location have served to protect it over the millennia.

#### Cairns

There are records for a total of 23 prehistoric (Bronze Age) round cairns or barrows in the training area, of which 15 are scheduled, or form part of a scheduled monument. The most significant of the cairns as landscape features are the larger hilltop examples including White Barrow (439600) and Limsboro' Cairn (440633) and one large stony example on Whittor.(439735). In general, however, cairns in this TA are small and discreet. Some survive as bare heaps of stone, while others have a certain amount of turf covering. Three of the smaller cairns contain stone cists (439738; 442724; 442789), though all have been disturbed. A number of small, low, stony or earthen mounds may also be included with the cairns, though in some cases the remains are barely perceivable and their authenticity is not always proven.

Cairns were frequent targets for interventions by Dartmoor's antiquaries and treasure seekers in the past, often leaving the remains heavily disturbed with results unrecorded. Most of the above examples show signs of interference, especially the cists, which have all been opened.

#### Hut circles and settlements

Records exist for 26 sites where prehistoric round houses survive, together in many cases with elements of enclosure walls, often in small to large groups, forming settlements. Most of the hut circles and their associated settlements probably had origins in the early to mid 2nd millennium BC.

The largest and most impressive of these is at Langstone Moor (439615) where at least 35 stone hut circles are associated with various enclosures, though some of the huts are free standing. There is also an impressive array of 24 huts within sub-divided enclosures to the north of Whittor (439615). Many smaller settlement and groups of individual dwellings are spread along the valleys of the Walkham and Cowsic Rivers and Foxholes Streams. These tend to be smaller huts with minimal or no associated enclosures. The extent of the remains varies between subtle circular earthworks with minimal stone showing through the turf, and more robust examples with massive walls constructed from edge-set stone.

Many of Dartmoor's hut circles have been subject to archaeological investigation in the past, principally in the late 19th century, though, unlike cairns, these have usually been recorded to some extent. Notable within Merrivale TA the settlement at Langstone Moor was investigated in 1894 when eleven of the huts were excavated (Newman 2003). Stone robbing has not been too big a problem in Merrivale TA where 19th-century land improvement was less of an issue, though it has certainly occurred among the settlements on the slopes to the north of Whittor.

#### Reaves

Reaves (prehistoric linear boundary banks) are common over much of western Dartmoor, where fine examples have been recorded within Merrivale TA at Roos Tor (439812), Whittor (439762) and on Cudlipptown Down (439967). These linear banks of earth and stone are normally very stable and insusceptible to casual damage, although many have been fossilized into later walling schemes and some have become disguised by a natural overgrowth of turf.

#### Medieval/post medieval agriculture and settlement

The majority of the Merrivale TA comprises high moorland, where medieval and later attempts to settle and farm are very few. However, on the slightly lower lands around Cudlipptown Down, contained within modern enclosures, are the remains of two deserted settlements (439897; 439894). Both comprise turf-covered outline foundation ruins, representing the remains of rectangular structures, including longhouses as well as additional smaller buildings. There is also much evidence of strip cultivation in the form of subtle earthworks, including strip fields, lynchets and ridge and furrow as well as turf hedge banks used to divide up plots of land (919078). Although undated archaeologically, their appearance and similarity to other dated Dartmoor sites, suggests that occupation would have been loosely within the medieval or post-medieval period. Once collapsed these ruins achieved stability fairly quickly and appear to have remained undisturbed while a lack of intensive farming activity in the surrounding fields has preserved the cultivation earthworks.

#### Medieval/post-medieval industrial

Tin streamworking remains are to be observed along many of the river valleys and tributaries within Merrivale TA including sizable stretches of the Walkham (1064674), and a large area of the Colly Brook (1400165), while isolated patches survive along the Cowsic (1184973), Blackabrook (1065681), Beardown Brook (619345), Foxhole Stream (966140) and the West Dart (1050209). A particularly extensive streamwork, called Dead Lake (*part of* 1064674), extends north of the River Walkham on Cocks Hill. Although several tinworks have been scheduled elsewhere on Dartmoor, none within this training area have been so designated.

Tinworking remains of this type represent episodes of major upheaval within the landscape, sometimes for considerable periods of time, followed by abrupt abandonment. The activity leaves deep scars rather than the more subtle evidence of some other past activities, though parts of the workings have become smoothed by time. The interiors of the tinworks comprise much discarded material left behind by the extraction process, now often overgrown by turf. Despite the inherent robustness of tinwork remains they have, over time, become subject to encroachment by mires, which, in some cases, such as at the head of the River Walkham and Colly Brook, have completely obscured parts of the evidence and rendered large areas inaccessible. Beyond this, they have not been subject to robbing or re-use of stone and survive, as far as can be known from observation, largely undisturbed. Pit works and prospecting pits of various size and extent are found in several places across Merrivale TA but have not been subject to any interference since they were abandoned, though the soft earth of the spoil mounds has in some cases made a home for burrowing animals.

Small rectangular buildings or shelters are commonly associated with the tinworks, often built within the worked area, and usually referred to as tinners' huts or lodges. Seventeen of these stone built shelters have been recorded as foundation ruins, including four on the Tavy (1064657; 440643; 440640; 440658), three on the West Dart (443977; 443962; ) and two each on the Foxtor Stream (442771; 442522) and Beardown Brook (619357; 619379). None of these remains are scheduled. These huts were not built to endure and their ad-hoc construction from whatever stone was available, often means their walls have become tumbled. A more enduring building was built by the tinners beside the River Walkham

to smelt tin at Upper Merrivale (439629). This building was archaeologically excavated in the 1990's and has since been allowed to stabilise naturally. Many large stone artefacts retrieved from the building have been left at the site.

Wheal Prosper (439709) is a small, late 18th to early 19th century tin mine beside the River Walkham. The surface remains comprise an open cutting, surface evidence of shallow shafts with spoil heaps, a leat, a stamping mill with dressing floor, and a large, ruined, stone building. All these remains survive as stable earthworks or ruined structures, though evidence of a buried stone wheelpit is also visible.

#### THE CONDITION SURVEY: RESULTS

#### Condition

Of the sites listed in previous reports, 22 have now have updated status as either not found, natural features, nonantiquities or duplicates. These were eliminated as part of the 2018 assessment and have not been included in the 2022 survey or statistics, although the list has been slightly updated (Appendix 1). A total of 121 sites have therefore been revisited for the 2022 survey, presented on the accompanying spread sheet (Appendix 2). Three sites not previously included (SWL1034; SWL1035 and SWL1036) have now been added to the data base.

Of the 121 sites included in the 2022 statistics, 63 (54%) may be stated to be in good condition, 43 (35%) in fair condition and 15 (12%) in poor condition. In the 2017-18 survey the figures differed slightly with 65 (55%) in good condition, 40 (34%) in fair condition and 12 (10%) in poor condition. These minor fluctuations are a result of small adjustments following a further assessment in the field, but overall the picture remains, unsurprisingly, static.

However, of the 36 scheduled monuments (SMs), 14 (38.5%) can be stated to be in good condition in 2022, while 17 (47%) are fair condition and 5 (14%) are in a poor condition. This compares with the 2018 statistics of good (40%), fair (48.5%), poor (14.5%), which has also remained static to within 1.5 percentage points.

#### **Stability and Change**

This more objective category measures the extent to which a heritage asset may be said to be in a stable condition, or otherwise, and notes any changes following previous surveys, which may be the result of damage through various causes, or erosion. This measure also acts as an indicator as to whether intervention may be beneficial in halting the decline, especially where caused by human agency.

From the total of 121 assets, 110 (91%) of the total sample remain in a stable condition, while 10 (8%) are reported as in gradual decline, in most cases this is due to very insignificant patches of erosion or minor threats. One asset (<1%) is in an improving state. The figures are summarised in Table 1 and Fig. 2, which both include the statistics from previous surveys for comparison.

These statistics represent an increase of 2% in the total number of heritage assets reported to be in a stable condition, while those considered to be in gradual decline has decreased by more than 2%, which indicates a generally positive direction of travel for the aggregate statistics within this Training Area.

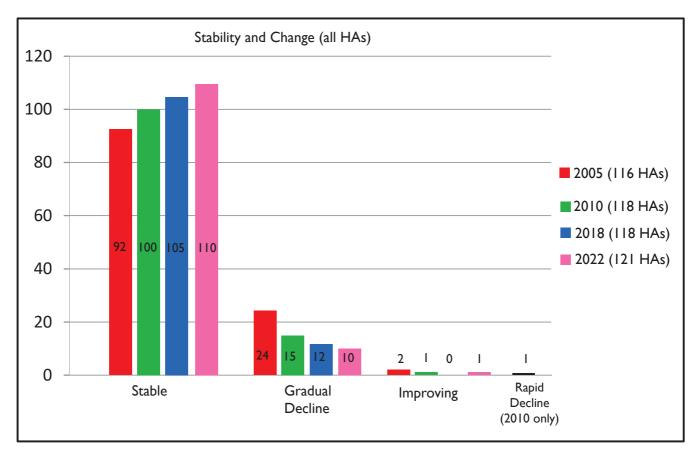

#### **Scheduled monuments**

It should be noted that the MoD DIO numbering scheme used in this report, was originally based on the National Monument Record system, which differs from the Historic England scheduling number scheme. This means that some single entries on the accompanying spread sheet using the DIO scheme (Appendix 2) often include one or several SMs. Also, the polygons used on Appendix 3 only delineate the limit of upstanding monuments, and not necessarily the outline used in the schedule, as the latter often does not reflect the full extent of the DIO scheme asset number in which the SMs are included.

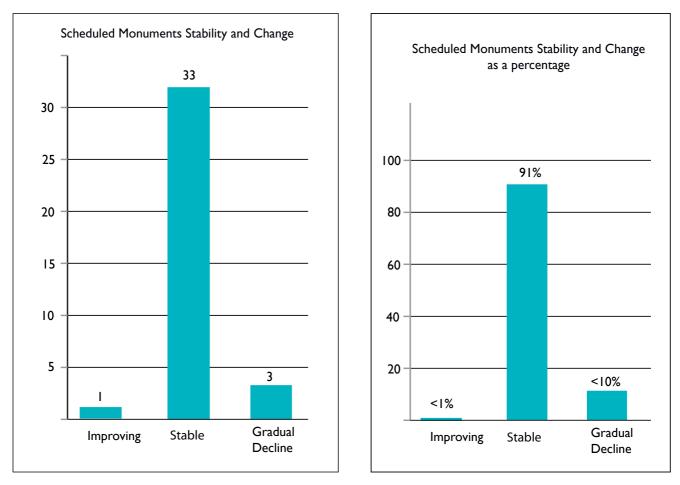

Thirty-three out of 36 assets (91%), which include one or more SMs, can be reported to be in a stable state (but see discussion below), whilst three SMs (<10%) are reported to be in gradual decline. In 2018, 11.5% were in gradual decline but none were improving (Newman 2018, Fig. 13), so overall a marked stabilisation can be perceived.

2022 survey of 121 heritage assets assessed	No.	%of total
Stable	110	91
Gradual Decline	10	8
Rapid Decline	0	0
Improving		<
2018 survey of 118 heritage assets assessed (excludes new 2018 sites)		
Stable	105	89
Gradual Decline	12	10.2
Rapid Decline	0	0
Improving	I	<
2010 survey of 118 heritage assets assessed		
Stable	100	84.5
Gradual Decline	15	12.5
Rapid Decline	I	<
Improving	2	1.5
2005 baseline survey of 116 heritage assets		
Stable	92	79
Gradual Decline	24	21
Rapid Decline	0	0
Improving	0	0

#### **MANAGEMENT ACTIONS**

#### Management measures

No management measures are currently in use for any of the assets, scheduled or unscheduled, within Merrivale TA, where threat levels are minimal. The use of off-road vehicles was a problem in 2005, especially on Langstone Moor and on the east slope of Roos Tor, where in both cases, assets have been reported damaged by vehicles in the past. In 2022, evidence of vehicle activity appears to have diminished, and both previously reported cases have begun to stabilise. Vehicles are not permitted on the commons, and use of ordnance in the TA is restricted to small arms. Stocking levels of sheep, cattle and ponies are currently low (also observed in the 2010 and 2018 report), reducing the problem of poaching, and the pressure from civilian visitors for much of the TA is minimal due to its remoteness. The Coronavirus pandemic of 2020-2022 is also probably a factor, with a large reduction in visitor numbers and group activities on the moor for the duration.

#### SCHEDULED MONUMENTS (SMs)

Of the 36 SMs, 33 (91%) are in a stable state and only 3 (<10%) are in gradual decline. In all cases through forces of attrition and in no case through accidental or wanton damage by humans. In all but three of these cases, no immediate action, other than continued monitoring, is necessary.

**439621 (SM No: 1007897)** Langstone Moor stone row (Fig. 7). The category of 'improving' can usually only be applied as a result of management interventions, however, at this site, a former vehicle tracks, which truncates the row, used by walkers and livestock (as reported in 2005 and 2010), appears to have seen less use than previously and the threat of erosion has lessened so in that respect there is an improvement. However, the terminal standing stone sits within a water-worn erosion hollow, where supporting stones around the base became further exposed between the 2010 and 2018 assessments as the hollow retained more water. This situation continues in 2022 and the risk of the stone toppling remains present.

**439606 (SM No: 1007550)** Langstone Moor stone circle. Conservation work was carried out in 2003 to fill erosion hollows around the bases of the upright stones and prevent the stones from toppling (see Newman 2003). On two of the most vulnerable stones, this provision is beginning to fail. In 2018 this was not considered critical but watery hollows are again present around several of the stones and the erosion is back to its pre-2003 level. Remedial action should now be considered, whilst continued monitoring will be necessary to assess further decline in this situation. (see Figs 8 and 9).

**439571 (SM No: 1008013)** Beardown Man standing stone. The photograph taken for the 2005 Baseline Survey (Fig. 5) shows the base of the stone to have been reinforced with aggregate material as a conservation measure. The 2022 photograph shows that this material has totally washed and eroded out probably as a result of animal poaching. Reinstating the base material would be desirable, but at the very least these changes should be considered during future inspections and the need for actions assessed on the basis of this gradual decline.

#### NON-SCHEDULED MONUMENTS

There is little to report regarding changes to the condition of individual non-scheduled sites in Merrivale TA and only the more significant monument types deserve comment here. However, it is worth noting that two sites highlighted in the 2010 condition survey are still in gradual decline.

**440633** Limsboro' Cairn. Loose stone continues to be moved about as reported in 2010 and 2018 probably by the public. Indeed since 2018 a crude shelter has been constructed on the north side, though may not have been completed.

**1406369** Cut Hill stone row. The western most recumbent stone is supported by a plinth of peat. In 2010 it was reported that ground beneath is eroding quite rapidly. This was noted again in 2018, and in 2022 it appears that this process continues, though is not crucial to the survival of the monument.

**1065830** The Prison Leat was reported to be in rapid decline in 2010, although in 2018, this appeared to have slowed as the channel has become filled with vegetation and animal stocking levels declined. In 2022 the rapid growth of rushes in the wetter parts of the leat are notable. Although this earthwork, and its masonry lining may be considered mostly stable, its wetter areas are eventually going to become overwhelmed by vegetation. Realistically there is little in management terms that can prevent this, where the most appropriate policy for its earthwork components would be benign neglect.

#### CONCLUSION

The great majority of heritage assets within Merrivale Training Area survive in a good to fair condition, those that are classified as poor (15 out of 121) are mainly so by way of legacy. Under the heading of stability and change, the percentage of sites reckoned to be in gradual decline has decreased to 8% of the total, a drop of 2.2% since the last survey of 2018. No sites may be stated to be in rapid decline, and this has been the case since just after 2010. Of the 36 scheduled monuments, only three are considered to be in a gradual decline. Only three sites (all SMs) are considered to be in a condition worthy of light intervention to prevent further issues. All sites assessed as being in gradual decline have become so as a result of natural forces.

Overall the survey has demonstrated that, since the previous survey of 2018, the heritage assets in Merrivale Training Area have continued to not suffer any form of damage through deliberate human intervention, either wanton or accidental, and that current activity, usage and management of the TA provides favorable conditions for the assets to continue to survive in a stable state. The statistics confirm (Table 1) that since the first assessment in 2005, the number of sites in a stable condition has steadily increased, while those considered to be in decline have steadily decreased. In the handful of cases where concerns are raised, this is due to natural causes, such as waterlogging, overwhelming by vegetation, or livestock poaching, though the latter is minimal, and all could be ameliorated by some light-touch remedial action.
