APPENDIX H - LEGISLATIVE AND PLANNING FRAMEWORK

EXECUTIVE SUMMARY

The site is approximately 11.12ha in size, its land uses has been relatively unchanged and remains as agricultural farmland.

The initial development plans will include up to 200 residential dwellings, along with landscaping, public open space and associated infrastructure works.

This report is for the purpose of establishing a comprehensive technical baseline and will inform on potential liabilities associated with the site. The report will be used to support an outline planning application.

A Preliminary Risk Assessment (PRA) has been undertaken to develop a preliminary conceptual site model (pCSM) identifying potential ground contamination risks and evaluate the likely significant risks. In addition, a preliminary assessment of geotechnical risks has been provided.

It should be noted that this executive summary does not form a standalone document and should be read in conjunction with the WSP Preliminary Risk Assessment (Ref: 70084697-301).

ENVIRONMENTAL SETTING

The ground profile of the site is predominantly topsoil with the potential for localised areas of Made Ground in the north western corners of the site relating to the disused railway line, this in turn is underlain by superficial deposits which comprise Head Deposits in the western area of the site and Lowestoft Formation predominantly located in the far north western corner, central and eastern areas of the site. These deposits overlie the Kesgrave Catchment Subgroup which is typically noted to be present across the site and also outcrops in the central and western parts of the site.

The underlying bedrock comprises the London Clay Formation located across the site with the exception of the north western corner of the site, the London Clay is underlain by the Thanet Formation and Lambeth Group which is anticipated to be underlain by the White Chalk Subgroup at depth.

The Lowestoft Formation and Head Deposits are classified by the Environment Agency as Secondary Undifferentiated Aquifers, the Kesgrave Catchment Subgroup, Lambeth Group and Thanet Formation are classed as a Secondary (A) Aquifer, the White Chalk Sub-group as a Principal Aquifer and the London Clay as an Unproductive Stratum;

There are no surface water bodies present on site, the nearest features are minor drainage channels and streams situated north-west and west of the site, which flow southward into the River Stort via Stanstead Brook. To the east and south of the site, isolated irrigation ditch and a small pond can also be observed. Mapping indicates regional groundwater flow is anticipated to be south. The site and its surroundings are situated within a nitrate vulnerable zone.

POTENTIAL FOR GROUND CONTAMINATION

WSP considers that on-site sources of potential contamination are associated with the current and historical uses of the site, including agricultural land use, and ground associated with the disused railway line. Potential off-site sources of contamination include the surrounding current and historical land uses including the adjacent former sand and gravel extraction and associated infilling of the pits, agricultural land and surrounding residential and commercial development.

Plausible contaminant linkages have been identified with respect to human health including dermal contact with contaminated soils and waters and inhalation or ingestion of contaminated soils, dust or water. Plausible contaminant linkages identified to controlled waters include the possibility of leaching of contaminants, lateral migration of contaminants into surface waters off site. Plausible contaminant linkages to building structures include direct contact with contaminated soils, groundwater or immiscible contaminants.

In conclusion, the Preliminary Risk assessment indicates generally a **Low to Moderate** risk to human health, controlled waters, and site structures.

GEOTECHNICAL CONCLUSIONS

The geotechnical risks that require further consideration during subsequent stages are:

- Lateral variation of superficial soils;
- Below ground obstructions associated with the former, now dismantled railway spur in the north and north west of the site; and
- The potential for both compressible and / or desiccated soils associated with the cohesive Head and Lowestoft Formation.

WSP consider shallow footings within the Lowestoft Formation (diamicton) or Kesgrave Catchment will most likely provide appropriate foundations for low rise lightly loaded structures. A targeted intrusive ground investigation is required to inform on subsequent stages of design.

RECOMMENDATIONS

WSP recommends the following actions are undertaken:

- Complete a detailed desk study to assess and potentially zone the unexploded ordnance (UXO) hazard level on the site.
- An intrusive ground investigation should be undertaken to assess:
  - Baseline ground conditions at the site and further investigations of contaminant concentrations, ground gas and groundwater monitoring. It should be noted that this investigation could be undertaken post planning submittal;
  - Geotechnical parameters to assist subsequent design.
- Following the ground investigation, an interpretative Ground Investigation Report (GIR) should be produced including an assessment of the risk from contamination at the site and a preliminary geotechnical appraisal.

1 INTRODUCTION AND OBJECTIVES

1.1 AUTHORISATION AND PURPOSE OF ASSESSMENT

WSP was instructed by Bloor Homes Ltd and Gillian Smith, John Robert Carmichael Smith, Robert Giles Russell Smith and Andrew James Smith (the Client) to undertake a Preliminary Risk Assessment (PRA) at the Land East of Station Road (Elsenham, west of Elsenham train station), Elsenham ('the Site') as shown on **Figure 1** in **Appendix A.1.**

1.2 PROPOSED DEVELOPMENT

The site currently consists of undeveloped arable farmland. The site is bound by agricultural land to the north and east, the consented Phase 1 development to the south; and by the West Anglia Mainline Railway, Elsenham station car park and existing commercial facilities to the west. The site is approximately 11.12ha in size.

WSP understands that the initial development plans will include up to 200 residential dwellings, long with landscaping, public open space and associated infrastructure works.

This report is for the purpose of establishing a comprehensive technical baseline and will inform of potential liabilities associated with the site. The report will be used to support a planning application for the 2nd Phase of the Elsenham development known as "Land east of Station Road, Elsenham".

1.3 OBJECTIVES

The key objectives of this assessment are to:

- Develop a preliminary conceptual site model (pCSM) to identify potential ground contamination risks associated with the site;
- Evaluate the likely significance of risks associated with potential ground contamination through a contaminant linkage assessment for the proposed development; and
- Identify preliminary geotechnical risks that would need to be considered once development proposals have been produced.

1.4 SCOPE OF WORKS

The scope of works undertaken in this assessment comprises:

- A site walkover of publicly accessible areas to document the current land use and site setting;
- A review of publicly available historical maps and site plans (where available) to identify former land uses and potential contaminative activities on and surrounding the site;
- A review of previous reports completed for the site;
- A review of relevant regulatory authorities including the Environment Agency (EA), Local Council planning website, Building Control Officer (BCO), and the Contaminated Land Officer (CLO).
- A review of UXO risk at the site;
- A review of relevant publicly available information relating to hydrological features, hydrogeology, neighbouring land use, ecologically sensitive uses and geology in order to establish the environmental setting of the site and the sensitivity of the location;
- Development of a preliminary conceptual site model via the source-pathway-receptor contaminant linkage approach;

- An outline of environmental risks with respect to ground, groundwater and ground gas conditions, which may potentially arise as liabilities or constraints; and
- A preliminary desk based geotechnical assessment of existing ground conditions to identify potential ground engineering risks.

This report has been prepared in general accordance with:

- Part 2A, Environmental Protection Act 1990;
- Environment Agency Land Contamination Risk Management (LCRM) 2020; and
- The National Planning Policy Framework.

The report contains British Geological Survey (BGS) and EA information.

1.5 LIMITATIONS

This report is addressed to and may be relied upon by the client (Bloor Homes). It may not be relied upon or transferred to any other parties without the express agreement of WSP in writing. The report should be read and used in full. No responsibility will be accepted where this report is used, ether in its entirety or in part, by any other party. WSP cannot be held liable for third party information.

The limitations of this assessment are attached in **Appendix B**.

2 PREVIOUS REPORTS

Previous reports have been completed by WSP on and adjacent to the current site. A summary of each report is presented below.

ON-SITE

Preliminary Risk Assessment, Elsenham Essex (WSP) Ref:18738-001, March 2013

WSP conducted a Preliminary Risk Assessment (PRA) across the wider Elsenham development within which the current site (Elsenham Phase 2) is located in the central west portion. The findings of the PRA specific to the current site have been summarised below.

The site is underlain by a series of superficial deposits comprising Head Deposits; Lowestoft Formation (formerly reported as Glacial Till); and Kesgrave Catchment Subgroup (formerly reported as Kesgrave Sands and Gravels). The bedrock beneath the site comprises London Clay; and the Thanet Formation and Lambeth Group (undifferentiated) (formerly reported as Lambeth Group, Thanet Sand Formation and Harwich Formation).

The Environment Agency (EA) classify the Head Deposits and Lowestoft Formation as Secondary Undifferentiated Aquifers; the Kesgrave Catchment Subgroup and Lambeth Group and Thanet Sand Formation as Secondary (A) Aquifers; and the London Clay as an Unproductive Stratum.

Historical information indicates potential sources of contamination on site including the former Elsenham & Thaxted Light Railway (adjacent to northern boundary of the site) and Mineral extraction in the south east (250-300m)

Surrounding land uses of significance to ground contamination include current and former landfills (750m south east), the Greater Anglia Railway (adjacent to western boundary of site), farms (200m north), and depots (20m north west of site).

WSP identified a low to moderate risk with regard to human health, controlled waters, built structures and geotechnical constraints. Recommendations include completing an unexploded ordnance (UXO) assessment; and a ground investigation to include baseline contaminant concentrations, ground gas and groundwater information and geotechnical parameters.

Infiltration Testing Report, Elsenham Essex (WSP) Ref:18738-003, March 2013

WSP completed a ground investigation and subsequent infiltration testing across the wider Elsenham site. The initial ground investigation comprised 50no. trial pits completed during September and October 2012. Trial pits located within the current Elsenham Phase 2 site are noted to be TP27, TP28, TP31, TP32, TP33, TP34 and TP35. Following on from the initial investigation 16no. trial pits and infiltration tests were completed across the wider Elsenham site during October 2012. The infiltration pits completed within the current Elsenham Phase 2 site have been identified as TP211, TP212 and TP212A.

An extract of the exploratory hole plan taken from the previous report is presented within **Appendix A.2,** and relevant exploratory hole logs are presented within **Appendix C.1**.

The ground conditions encountered relating to the current site include:

- Topsoil located across the Phase 2 site from ground level to proven depths ranging from 0.2m to 0.35m below ground level (bgl);

- Head Deposits located in the west / north west of the Phase 2 site; and encountered from 0.3m and 0.35m bgl to a maximum unproven depth of 2.0m bgl. The deposit comprised slightly sandy slightly gravelly clay with very sand clay at increasing depth;
- Lowestoft Formation (formerly noted as Glacial Till) located in the eastern and central area of the Phase 2 site. The formation was encountered from 0.3m and 0.9m bgl to a maximum unproven depth of 3.0m bgl; and comprised slightly sandy slightly gravelly clay with chalk and flint gravel; and sandy clay deposits.
- Kesgrave Catchment Subgroup (formerly noted as Kesgrave Sands and Gravels) encountered across the Phase 2 site beneath the Lowestoft Formation; beneath the Head Deposits in the west (TP33); and beneath the topsoil in the north / northwest (TP27); from 0.2m and 3.0m bgl to a maximum unproven depth of 3.7m bgl. Deposits comprised slightly gravelly slightly clayey sand.

Groundwater seepages were noted in TP33 at 2.5m bgl within Kesgrave Catchment Subgroup; and TP211 at 2.0m bgl within the Head Deposits.

Infiltration for TP211 could not be completed due to groundwater ingress; and testing within TP212 failed to reach 25% empty, therefore a representative infiltration rate was not obtained. A more granular stratum (within the Kesgrave Catchment Subgroup) was encountered within TP212A and identified an outline infiltration rate of 1 x 10^{-5} m/s.

OFF-SITE

Preliminary Risk Assessment, East of Elsenham (WSP) Ref:11500582, November 2017

WSP conducted a PRA adjacent to the south of the current Elsenham Phase 2 comprising of 20ha of undeveloped agricultural land that has been consented to be developed into 350 dwellings. This site is regarded as Phase 1 of the Elsenham Scheme.

Potential on-site sources were noted to include Made Ground associated with former sand and gravel pits (250-300m south east), the former Elsenham and Thaxted Light Railway spur north east of Elsenham Station (50m), and the agricultural use of the site (surrounding land, north, east and south of site boundary). Off-site sources include the Greater Anglian Railway line (alongside the western boundary of the site), a depot (20m north east of the site alongside the Greater Anglian Railway line), and landfills (m south east).

Geotechnical constraints have been identified associated with the risk of lateral variability of deposits, below ground obstructions associated with the former railway, compressible ground, and desiccation of clay soils.

Overall a low to moderate risk was identified to human health, controlled waters, and geotechnical constraints.

3 SITE RECONNAISSANCE

3.1 SITE DESCRIPTION

The site location is provided as **Figure 1** (**Appendix A.1**) and a site layout plan as **Figure 2 (Appendix A.1).** A site visit was carried out by WSP on 11th October 2021 and a photographic record of key on-site observations is provided in **Appendix D**. **Figure 2** in **Appendix A.1** shows the location of each photo taken during the site visit.

Table 1 provides information relating to the site obtained from a review of Ordnance Survey (OS) mapping, online aerial photography, the site walkover, and relevant regulatory information contained within the Envirocheck Report **(Appendix E)**.

Table 1 – Site Information

Details	Description
Name and address of site	Land East of Station Road, Elsenham.
Grid reference	553600, 227080
Size	Approximately 11.12 ha
Site description and current use	The site occupied a section of a large agricultural field and was accessed from Old Mead Road adjacent to Elsenham station car park **(Photo 1)**. The site comprises agricultural land **(Photos 2 and 3)**. The northern field boundary consisted of hedgerows and semi-mature and mature trees **(Photo 4)**; The hedgerows were associated with drainage ditches (dry) on the field edge. Power lines are shown to run adjacent to the northern boundary **(Photo 5)**. The site's eastern boundary is not marked but cuts through part of the wider agricultural land. In the south and west the boundary is marked by a series of small blue posts within the field itself **(Photo 6)**. This is understood to denote the Phase 1 boundary line. The western boundary **(Photo 7)** runs alongside a hedgerow with mature trees and a drainage ditch. Older exploratory holes wells were noted adjacent to the western boundary of the site. No surface water bodies were present on site.
Ground cover	The site comprised agricultural land.
Trees and invasive species	Mature trees / hedgerows were predominantly noted along the western and northern boundary of the site. An ecological survey was not completed as part of the walkover.

Topography	Mapping indicates the site slopes down towards the west south west of the site by approximately 10m. The sites highest elevation is in the east.
Bulk material storage	No evidence of bulk material storage on site. Note a storage compound is present 75m north west of site.
Polychlorinated biphenyls (PCBs)	There were no substations noted on the site.
Waste storage	No waste storage areas were identified. A small pile of soils was noted along the western boundary near to the site entrance.
Asbestos containing materials (ACMs)	No ACMs were noted during the walkover.
Nearby features	North: Hedgerow and drainage ditch (power lines), beyond that; agricultural land, Farm and poultry houses observed. North west: Elsenham Railway station, carpark, and depot. South: Undeveloped agricultural land (to be developed in separate residential development (Phase 1)), beyond this, residential dwellings. East: Undeveloped agricultural land. West: Hedgerow and drainage ditch adjacent to boundary, behind it consists of the Greater Anglian Railway line and village of Elsenham.

4 HISTORICAL POTENTIALLY CONTAMINATIVE LAND USES

4.1 SITE HISTORY

The history of the site and surrounding area has been reviewed and determined with reference to Ordinance Survey maps contained within the Envirocheck Report (Ref: 285338568_1_1). A study into the former land uses and if they were potential contaminators has been undertaken. The following section provides a summary of this information. The Envirocheck Report is attached as **Appendix E**.

ON-SITE

Table 2 – On-site historical map review

Date of Mapping	Scale	Feature
1875-1877	1:2,500 (A10 and A11)	Mapping shows the site as undeveloped agricultural land. Site is segmented into three individual fields, boundaries between fields run north-south through the centre of the site; and east-west in the south west, joining with the north-south field boundary in the centre.
1897	1:2,500 (A10 and A11)	Removal of east-west field boundary in the south west of site. Remnants of the field boundary can be seen on the far western site boundary. Public footpath runs along the northern site boundary.
1920-1923	1:2,500 (A10) 1:10,560	Development of the Elsenham & Thaxted Light Railway line intersects the site on the northern and north-western boundaries. No apparent change to main site, land use remains as agricultural.
1951	1:10,560	North-south field boundary running through the centre of the site is partially removed in the southern portion of the site.
1966	1:10,000	Elsenham & Thaxted Light Railway line is no longer present. Site remains undeveloped agricultural land. Central field boundary running north-south is no longer noted.
1966-present day	1:10,000 1:2,500 (A10 and A11)	No apparent change. 1999 mapping shows a track/access road constructed along the north western boundary of the site associated with the train station car park.

OFF-SITE

Table 3 – Off-site historical map review (500m)

Name	Direction	Approx. Distance (m)	Years feature observed
Agricultural land	N, S and E	0-500	1875-present
Cattle Pens Depot and associated tank noted Station car park	NW	20	1920-1970 1970 to present 1994 to present
Greater Anglian Railway line & Elsenham Station	W	Adjacent 50m from western site boundary	1875 to present
Garden Nursery with Glazed Roof Buildings and associated tanks Removal of Garden Nursery with Glazed Roof Buildings and associated tanks, development of residential/commercial dwellings	NW	50	1920 to 1970 1970 to present
Agricultural Land Unnamed buildings Expansion of residential/commercial area	W W SW	50 50-150	1875-1951 1951-1966 1970-present

Agricultural Land Noted as Poultry Farm and works buildings Area noted as works buildings Area noted as the Farm House and Bell House	N	75-200	1875 to 1951 1951 to 1983 1983 to 1999 1999 to present
Sand and gravel pits Pits no longer noted (potentially infilled)	SE	100-250	1951-1983 1983-Present
Sand or clay pit Pit disused Suspected infilling of pit	E	240	1875-1897 1897-2006 Between 2006-2021
Alsa Wood	W	250-500	1881 to present

5 ENVIRONMENTAL SETTING

5.1 GEOLOGY AND HYDROGEOLOGY

This report contains geological map extracts taken from the British Geological Survey (BGS) Digital Geological map of Great Britain, Map Sheet 222- Great Dunmow (1:50,000, 1990). Geological information has been reviewed and presented in **Table 4** alongside aquifer designations for the relevant geological units.

Table 4 – Geological Mapping Summary

Strata	Location	Description	Aquifer Designation
Head	Along western boundary	Clay, silt, sand, and gravel.	Secondary Undifferentiated
Lowestoft Formation	Far north western corner and in the east of the site	Diamicton – till, with flint / chalk content	Secondary Undifferentiated
Kesgrave Catchment Subgroup	Present across the stie and outcropping in the central and western portion of the site.	Sand and gravel.	Secondary (A) Aquifer
London Clay Formation	Entire site, except for the north western corner	Clay, Silt and Sand	Unproductive Stratum
Thanet Formation and Lambeth Group (undifferentiated)	Potentially beneath entire site	Clay, Silt and Sand	Secondary (A) Aquifer

In addition to the onsite geology it is noted that the Lewes Nodular Chalk Formation and Seaford Chalk Formation (White Chalk Sub-group) is adjacent to the north western site boundary overlain by the superficial deposits and should be anticipated at depth beneath the Thanet Formation and Lambeth Group (undifferentiated).

A previous investigation completed by WSP in September and October 2012 is detailed within **Section 2.** Overall, for the current site, topsoil was encountered across the site; Head Deposits were located in the west / north west; Lowestoft Formation located in the eastern and central area of the site; and the Kesgrave Catchment Subgroup located across the site beneath the Lowestoft Formation; beneath the Head Deposits in the west (TP33); and beneath the topsoil in the north / northwest (TP27). A copy of the exploratory hole logs is presented in **Appendix C.1** and the exploratory hole plan is presented in **Appendix A.2**.

One publicly available BGS borehole was present within 100m of the site. A summary of the BGS boreholes is presented in **Table 5** below and a copy of the log is presented in **Appendix C.2**.

Table 5 - BGS Borehole Summaries

Borehole	Location	Strata encountered	From – to depth (m bgl*)	Depth groundwater encountered (m bgl*)
Tl52nw93	24m north	**Topsoil**	GL to 0.6	3.8
		Kesgrave Catchment Subgroup: Medium sand and traces of fine, angular well-rounded flint gravels, discrete clay seams throughout.	0.6 to 4.6	
		Red Crag Formation (Potentially Kesgrave Catchment Subgroup): Pebbly sand, mix of course and fine gravel with well-rounded and angular flint and medium sand.	4.6 to 9	
		London Clay: Clay, silty, fine sandy, dark grey.	9 to 10 (Not Proven)	

* metres below ground level

The BGS borehole log highlights uncertainty regarding the Red Crag Formation. WSP would agree with this uncertainty and would suggest it could be part of the Kesgrave Catchment Subgroup.

5.2 HYDROLOGY

There is one surface water abstraction located 413m south west of site operated by Michael Rowley Ltd (License No 6/33/27/*s/053) for agricultural use, however this is currently revoked.

Mapping indicates the nearest surface water feature is a drainage stream situated 34m west of the site. The drain forms part of a series of drainage channels around the north-west Elsenham residential area. The drains are noted to flow south into Stansted Brook (~900m south), which subsequently flows to the south west to the River Stort (~4.5km south west). Other relevant surface water features include an isolated irrigation channel 400m east of the site, and a small, isolated pond 300m south of the site.

Mapping indicates the site has a low risk of flooding from surface water (1000-year return) along the western boundary.

5.3 HYDROGEOLOGY

No groundwater abstractions are located within 500m of the site. The site is not located within an Environment Agency Source Protection Zone (SPZ). A SPZ 3 is located 30m to the north of the site.

BGS groundwater flooding susceptibility data indicates that small areas in the east and south of the site have limited potential for groundwater flooding to occur. The central area of the site has a potential for groundwater flooding of property situated below ground level; and there is potential for groundwater flooding to occur at the surface in the west and along the western boundary of the site.

5.4 PRELIMINARY HYDROGEOLOGICAL MODEL

The ground profile of the site is predominantly topsoil with the potential for localised areas of Made Ground in the north western corners of the site relating to the disused railway line, this in turn is underlain by superficial deposits which comprise Head Deposits in the western area of the site and Lowestoft Formation predominantly located in the far north western corner, central and eastern areas of the site. These deposits overlie the Kesgrave Catchment Subgroup which is typically noted to be present across the site and also outcrops in the central and western parts of the site.

The underlying bedrock comprises the London Clay Formation located across the site with the exception of the north western corner of the site, the London Clay is underlain by the Thanet Formation and Lambeth Group which is anticipated to be underlain by the White Chalk Subgroup at depth.

Groundwater seepages were noted during the WSP ground investigation completed September and October 2012 at 2.5m bgl within Kesgrave Catchment Subgroup; and at 2.0m bgl within Head Deposits.

The BGS hydrogeological map of area between Cambridge and Maidenhead (Sheet 14; 1:100,00; 1984) indicates that groundwater depth at 65m AOD with flow direction likely to be towards the south. Mapping indicates ground level at the site ranges from 90m to 100m AOD suggesting that groundwater is between 25m and 35m bgl. It is considered that this is likely to be within the Thanet Formation and Lambeth Group or White Chalk, beneath the London Clay.

Localised shallow groundwater may be present within the granular lenses of topsoil and Made Ground (if present). A shallow groundwater body is likely to be present within the Kesgrave Catchment Subgroup and granular lenses of the Lowestoft and Head Deposits. Due to the presence of the Kesgrave Catchment Subgroup there is the potential for lateral migration across the site. Any significant vertical migration from the overlying cohesive Lowestoft Formation and Head Deposits will be limited. It is anticipated that a deeper groundwater body will be present within the Thanet Formation and Lambeth Group or White Chalk. Due to the presence of the overlying London Clay across the majority of the site any significant vertical groundwater migration will be limited with the exception of the north western corner where the London Clay is noted to be absent allowing continuity between superficial deposits and the underlying Thanet Formation and Lambeth Group; and Principal Aquifer of the White Chalk.

5.5 RADON

The site is in a Lower probability radon area (less than 1% of homes are estimated to be at or above the Action Level). No radon protection measures are necessary in the construction of new dwellings or extensions.

5.6 UNEXPLODED ORDNANCE RISK (UXO)

Publicly available bomb risk mapping supplied by Zetica and attached in **Appendix F**, indicates that the site is at a low risk of UXO.

A Pre-Desk Study Assessment (PDSA) was completed by Zetica, dated 10 November 2021 and is presented in **Appendix F**. The PDSA notes the following:

- WWI strategic targets within 5km of the site comprise transport infrastructure and public utilities.
- WWII strategic targes within 5km of the site include military camps and training areas; transport infrastructure and public utilities; Royal Air Force Stansted Mountfitchet; and Anti-Aircraft (AA) and anti-invasion defences.
- A military camp was established on land adjacent to the site.
- During WWII the site was within an area which noted High Explosive (HE) bombs with a bombing density of seven bombs per 405 hectares. Available records indicate HE bombs fell in close proximity to the site.

The PDSA has recommended that a detailed desk study is commissioned to assess, and potentially zone the UXO hazard level on the site.

5.7 MINERAL EXTRACTION

There are two recorded mineral sites within 500m of the site as summarised in **Table 6**.

Table 6 – Mineral Extraction within 500m of the site

Site Name	Location	Status	Geology (Commodity)	Type
Elsenham (Ref:6518)	388m south-east	Ceased	Kesgrave Catchment Subgroup (Sand)	Opencast
Elsenham Sand and Gravel Pit (Ref: 225975)	429m east-south-east	Ceased	Kesgrave Catchment Subgroup (Sand and Gravel)	Opencast

5.8 LANDFILLING

No historical or current landfill sites are located within 500m of the site. The nearest historic landfill is located 647m east of the site and relates to Greenham Construction, Elsenham. The last input date was noted as April 1994 and included waste comprised industrial and commercial waste.

Potentially infilled ground has been identified at two localities within 500m of the site; the first being a small disused pit 240m east; and a large disused sand and gravel pit 265m south east. Composition of the filled land unknown.

5.9 ECOLOGY

The entirety of the site is situated within a Nitrate vulnerable zone. No other land use sensitivities are recorded.

6 REGULATORY CONSULTATION

6.1 REGULATORY INFORMATION

Information relating to various regulatory controls has been taken from the Envirocheck Report, which is presented in **Appendix E**. The potential for hazardous materials to impact upon the ground conditions, surface or groundwater on-site are summarised below within **Table 7**.

Table 7 – Regulatory Information within 500m

Environmental Data	Distance from site (within 500m)	Details	Potential risk
Contaminated land register entries and notices	N/A	No entries on the contaminated land register were recorded within 500m of the site.	No
Discharge Consents	54m West	Thames Water Utilities Ltd (Ref: Temp.0914). Sewage discharge into Stansted Brook, issued November 1989. Authorisation Revoked April 2001.	No, discharge is historic and has been inactive for considerable time.
	55m West	Thames Water Utilities Ltd (Ref: Temp. .0913) Sewage discharge into Stansted Brook, issued September 2010. Surrendered under EPR 2010.	No, discharge is historic and has been inactive for considerable time.
	86m West	Willis Gambier Ltd (Ref: Prcnf14350) Trade Discharges-Site drainage (contaminated surface water, not tips) into a ditch/tributary of the River Cam, issued August 2000, Lapsed (under Environment Act 1995, Schedule 23). Revoked March 2013.	No, discharge is historic and has been inactive for considerable time.
	247m North-West	Gales A (Ref: Prcnf17494) Sewage discharge into unnamed tributary of River Cam, issued March 2005, New Consent (Water Resources Act 1991, Section 88 & Schedule 10 as amended by Environment Act 1995)	No, discharge is historic and has been inactive for considerable time.
Local Authority Pollution Prevention and Controls	N/A	No entries on for local authority pollution prevention controls within 500m of the site.	No
Pollution Incidents to Controlled Waters	N/A	N/A	No
Substantiated Pollution Incident Register	N/A	N/A	No

Environmental Data	Distance from site (within 500m)	Details	Potential risk

6.2 PLANNING

The site to the south benefits from an outline planning consent for up to 350 dwellings.

6.3 CORRESPONDENCE

CONTAMINATED LAND OFFICER (CLO)

The Contaminated Land Officer for Uttlesford District Council was contacted on 24th September 2021.

A response was obtained on the 22nd October 2021, with the information summarised below:

- Information regarding the Greenham Construction Materials Limited landfill situated ~600m south east of the site on Henham Road, Elsenham.
- The site has no records of private water supplies or Part B Process within 500m.
- It has been stated that '*There are areas of historical land use that indicate potential contamination and we are not aware of any remediation*'.
- The mapping provided shows railway lines (marked in red) situated along the western and northern boundary of the site.
- No complaints have been received regarding this site.
- The site has not been risk rated by this Authority as contaminated land under part 2A Environmental Protection Act 1990. The site is viewed as a low priority for determination and no action is proposed for the site. No environmental issues have been associated with this site.

A copy of the full correspondence presented in Appendix G.1.

BUILDING CONTROL OFFICER (BCO)

The Building Control Officer for Uttlesford District Council was contacted on 24th September 2021. The Building Team Leader for Uttlesford District Council has stated there is no building control records on this site or any information available, and they do not have any further information.

A copy of the full correspondence presented in Appendix G.2.

ENVIRONMENT AGENCY (EA)

The EA was contacted on 24th September 2021. A response was obtained on the 10th November 2021, with the information summarised below:

- Regarding the Landfill situated 647m south-east of site; The site (landfill) was originally permitted as a non-hazardous landfill but due to its' proximity to Stanstead airport it never took food waste or anything biodegradable, mainly just building waste but not truly inert as it did accept wood and plasterboard etc. Its' permit is held by Viridor but day-to-day is run by Ingrebourne Valley Limited.
- There are no leachate or gas issues at the site.
- Four pollution incidents noted within 500m of site; crude sewage from a pipe failure below ground, asbestos and vehicle/vehicle parts from fly tipping and atmospheric pollutants from burning of waste.
- Not aware of any land contamination issues, with respect of pollution to the water environment, relating to this site or within 500m.

- There are no abstraction licences within 500m of the site. The nearest licences are approximately 1.1 km from the site in the Upper Lee area.
- We are not aware of any soil or groundwater remedial works carried out at the site or within 500m.

A copy of the full correspondence presented in Appendix G.3.

7 CONCEPTUAL SITE MODEL (CSM)

7.1 INTRODUCTION

The preliminary CSM is based upon the environmental conditions of the Site as described in the previous sections.

The methods used within this assessment follow a risk-based approach; with the potential environmental risk assessed qualitatively using the 'source-pathway-receptor' contaminant linkage concept introduced in the guidance documents (principally the EA's LCRM 2020) on the practical implementation of the Environmental Protection Act 1990.

Environmental risk can be defined as the combination of the consequence of a harmful effect and the probability of its occurrence. The existence of a contaminant linkage is primarily dependant on site usage and environmental conditions.

The environmental risk assessment has been carried out by identifying and evaluating the significance of the following:

- Potential Sources of Contamination: these include any actual or potentially contaminating materials and activities, located either on or in the vicinity of the Site;
- Potential Pathways for Contamination Migration: these are the routes or mechanisms by which contaminants may migrate from the source to the receptor; and
- Potential Receptors of Contamination: these include present or future land users, activities or persons at the Site.

The preliminary CSM was developed based on the proposed residential end use at the Site. A summary of the applicable legislative and planning framework for the assessment is presented in **Appendix H. Table 8** provides a key to the potential pathways and receptors identified at the Site. The on-site preliminary CSM is presented in **Table 9**, and the off-site CSM in **Table 10.**

Table 8 – Potential Pathways

Receptor Type	Receptors	Potential Pathways			
		On-site contaminant source	On-site ID	Off-site contaminant source	Off-site ID
Human Health	Site users (current and future maintenance workers)	▪ Dermal contact with contaminated soils and waters ▪ Inhalation of contaminated soils, waters and vapours/gas ▪ Ingestion of contaminated soils and waters	1	Inhalation/ingestion of contaminated soils in airborne dust	6
	Neighbouring site users	▪ Inhalation/ingestion of contaminated	2	- Inhalation/ingestion of contaminated soils in airborne dust	7

Receptor Type	Receptors	Potential Pathways			
		On-site contaminant source	On-site ID	Off-site contaminant source	Off-site ID
		soils in airborne dust			
Groundwater	Lowestoft Formation and Head, (Secondary Undifferentiated Aquifer). Kesgrave Catchment Subgroup and Thanet Formation and Lambeth Group (Secondary (A) Aquifer), White Chalk Sub-group (Principal Aquifer).	▪ Leaching of contaminants from soils ▪ Migration of contamination in groundwater ▪ Migration of immiscible contaminants ▪ Infiltration of contaminated surface water	3	Migration of contaminated groundwater, surface water or immiscible contaminants	8
Surface Water	Streams and drains and their associated water courses.	▪ Runoff of contaminated surface water ▪ Migration of immiscible contaminants	4	Migration of contaminated groundwater, surface water or immiscible contaminants	9
Building Structures	Buildings located around the site.	▪ Direct contact with contaminated soils, groundwater or immiscible contaminants	5	Migration of contaminated groundwater, surface water or immiscible contaminants	

Table 9 – On-site conceptual site model

Location	Source	Potential Contaminants	Pathway ID (Table)	Comment on Hazard Realisation	Risk Rating
North of site	Made Ground associated with the construction and removal of Elsenham & Thaxted Light Railway line.	A wide range of potential contaminants, depending on the source of material, but may include metals, cyanide, hydrocarbons, polycyclic aromatic hydrocarbons (PAH), asbestos, PCBs, volatile organic compounds (VOCs) and semi-volatile organic compounds (SVOCs).	1-2	▪ Made Ground generated during the construction and subsequent demolition of the railway line and historical site uses may be considered a source of contamination that has had the potential to migrate into shallow groundwater in the north west / west of the site including the Secondary (A) Aquifer of the Kesgrave Catchment Subgroup. With the London clay likely to have thinned out in the northern extent of the site which would act as an aquitard, localised vertical migration may have occurred into the underlying Secondary (A) Aquifer of the Thanet Formation and Lambeth Group.	LOW to MODERATE
Entire Site	Current and historic uses of the Site, as outlined in **Tables 1 and 2** including potential for agricultural use, use of machinery and materials.	Depending on the source material potential contaminants include total petroleum hydrocarbons (TPH), PAH, hydrocarbons from machinery, VOCs, SVOCs, polychlorinated biphenyl (PCBs), agricultural chemicals including fertilisers (ammonia and ammonium) and pesticides (nitrite and nitrates).	1-4	▪ There may be the potential for fuel/chemical spills, use of pesticides and sewage sludge during the site use for agriculture and machinery linked to agricultural work. ▪ During flooding events any surface contaminants may have mobilised to the nearby surface water drainage systems off site. ▪ Localised areas of contamination may migrate into the underlying shallow groundwater within the Secondary (A) Aquifer of the Kesgrave Subgroup Catchment there may be the potential for lateral migration within the Secondary (A) Aquifer. ▪ There may be the potential for vertical migration of contaminants into the underlying Secondary (A) Aquifer of the Thanet Formation and Lambeth Group in the north west / western corner of the site. The remaining area of the site however is underlain by the Unproductive stratum (London Clay Formation) and therefore any significant vertical migration to the deeper groundwater body will be limited beneath the remaining parts of the site.	LOW to MODERATE

Table 10 – Off-site conceptual site model

Location	Source	Potential Contaminants	Pathway ID (Table 6)	Comment on Hazard Realisation	Risk Rating
Surrounding land uses within 500m of the site to include agricultural use; nearby residential and commercial development and former sand and gravel extraction and subsequent infill of excavations.	Surrounding current and historical uses (500m).	A wide range of potential contaminants depending on the source of material but may include, asbestos, metals, PCBs, hydrocarbons, PAH, VOCs and SVOCs, phenols and pathogens. agricultural chemicals including fertilisers (ammonia and ammonium) and pesticides (nitrite and nitrates).	6-9	▪ It is unknown whether good environmental management practises have been undertaken at the surrounding land uses. ▪ Potentially infilled land with an unknown composition, although downgradient from site may pose risk of ground gas migration.	LOW to MODERATE

8 GEOTECHNICAL CONSIDERATIONS

8.1 GEOTECHNICAL HAZARDS

A list of ground stability hazards and the risk, as reported by Envirocheck, on the current site are summarised in **Table** .

Table 11– Geotechnical Hazards

Ground Stability Hazard	Risk
Collapsible Ground	Very Low
Compressible Ground	No Hazard
Ground Dissolution	No Hazard to Very Low
Landslide	Very Low
Running Sand	No Hazard to Very Low
Shrinking or Swelling of Clay	No Hazard to Low

8.2 GEOTECHNICAL CONSTRAINTS

Table 12 – Geotechnical Constraints

Geotechnical Constraints	Comments
Aggressive Ground	There may be the potential for Made Ground and underlying London Clay to have the potential to exhibit aggressive ground conditions.
Below ground obstructions	A railway spur formerly crossed the site, along the northern boundary, and in the north west of the site. Obstructions may be present associated with the dismantled spur. A rising main is also believed to be present along the western boundary.
Lateral changes in geology	The superficial geology is understood to comprise the Lowestoft Formation (diamicton) and the Kesgrave Catchment. The deposits are anticipated to be laterally variable in thickness across the site. Localised Head deposits may be present adjacent to the north western / western boundaries. There may be the potential for localised deposits of Made Ground, particularly in the north / north west of the site associated with the dismantled railway spur.

Geotechnical Constraints	Comments
Ground dissolution	The chalk bedrock is overlain by both the London Clay Formation and the Thanet Sand Formation and Lambeth Group (undifferentiated); hence there is a low potential for dissolution features.
Soft/Compressible Ground	The Made Ground and cohesive deposits within the Head and Lowestoft Formation have the potential to be soft and compressible.
Excavations	Any Made Ground or superficial soils present have the potential to be soft and/or loose and the stability of unsupported excavations within these soils should not be relied on.
Shallow Groundwater	There is the potential for perched shallow groundwater to be present within the granular deposits of the Made Ground and superficial deposits. Previous investigations identified groundwater in the Head at 2.0m and in the Kesgrave Catchment at approximately 2.5m bgl.
Unexploded Ordnance (UXO)	The PDSA completed by Zetica has identified potential targets and HE bombs within close proximity to the site and recommends that a detailed desk study is completed to assess and potentially zone the UXO hazard level on site.
Slopes	The site was typically noted to gradually slope down towards the south of the site by approximately 4m. The north of the site is approximately 2m above Ordnance Datum (AOD) and the south 6m AOD.
Desiccated Soils	Head and Lowestoft Formation have the potential to be desiccated around the site boundaries where mature hedgerows were noted.

8.3 PRELIMINARY GEOTECHNICAL APPRAISAL

The current development proposals are not fixed; however, it is understood that the aim is to deliver a predominantly residential led scheme. It is anticipated that the residential units, predominantly low-rise, will be founded on shallow footings within the Lowestoft Formation or Kesgrave Catchment. If the Head deposits are found to encroach onto the development parcels, deeper foundations may be required. An intrusive ground investigation is required to inform the design of the foundations.

9 CONCLUSIONS AND RECOMMENDATIONS

Based on the findings of this preliminary assessment, WSP makes the following conclusions in the context of the proposed residential development of the Site.

9.1 ENVIRONMENTAL SETTING

The ground profile of the site is predominantly topsoil with the potential for localised areas of Made Ground in the north western corners of the site relating to the disused railway line, this in turn is underlain by superficial deposits which comprise Head Deposits in the western area of the site and Lowestoft Formation predominantly located in the far north western corner, central and eastern areas of the site. These deposits overlie the Kesgrave Catchment Subgroup which is typically noted to be present across the site and also outcrops in the central and western parts of the site.

The underlying bedrock comprises the London Clay Formation located across the site with the exception of the north western corner of the site, the London Clay is underlain by the Thanet Formation and Lambeth Group which is anticipated to be underlain by the White Chalk Subgroup at depth.

The Lowestoft Formation and Head Deposits are classified by the Environment Agency as Secondary Undifferentiated Aquifers, the Kesgrave Catchment Subgroup, Lambeth Group and Thanet Formation are classed as a Secondary (A) Aquifer, the White Chalk Sub-group as a Principal Aquifer and the London Clay as an Unproductive Stratum;

There are no surface water bodies present on site, the nearest features are minor drainage channels and streams situated north-west and west of the site, which flow southward into the River Stort via Stanstead Brook. To the east and south of the site, isolated irrigation ditch and a small pond can also be observed. Mapping indicates regional groundwater flow is anticipated to be south. The site and its surroundings are situated within a nitrate vulnerable zone.

The site and its surroundings are situated within a nitrate vulnerable zone.

9.2 POTENTIAL FOR GROUND CONTAMINATION

WSP considers that on-site sources of potential contamination are associated with the current and historical uses of the site, including agricultural land use, and ground associated with the disused railway line. Potential off-site sources of contamination include the surrounding current and historical land uses including the adjacent former sand and gravel extraction and associated infilling of the pits, agricultural land and surrounding residential and commercial development.

Plausible contaminant linkages have been identified with respect to human health including dermal contact with contaminated soils and waters and inhalation or ingestion of contaminated soils, dust or water. Plausible contaminant linkages identified to controlled waters include the possibility of leaching of contaminants, lateral migration of contaminants into surface waters off site. Plausible contaminant linkages to building structures include direct contact with contaminated soils, groundwater or immiscible contaminants.

The potential receptors were identified as:

- Current and future site users;
- Neighbouring residents and land uses;

- Secondary Undifferentiated Aquifers (Head Deposits; and Lowestoft Formation); Secondary (A) Aquifer (Kesgrave Catchment Subgroup; and Thanet Formation and Lambeth Group), Principal Aquifer (Chalk);
- Adjacent drainage stream west of the site and associated water courses, Stanstead Brook to the south of the site (~900m) and associated water courses.

In conclusion, the Preliminary Risk assessment indicates generally a **Low to Moderate** risk to human health, controlled waters, and site structures.

9.3 GEOTECHNICAL CONCLUSIONS

The geotechnical risks that require further consideration during subsequent stages are:

- Lateral variation of superficial soils;
- Below ground obstructions associated with the former, now dismantled railway spur in the north and north west of the site; and
- The potential for both compressible and / or desiccated soils associated with the cohesive Head and Lowestoft Formation.

WSP consider shallow footings within the Lowestoft Formation (diamicton) or Kesgrave Catchment will most likely provide appropriate foundations for low rise lightly loaded structures. A targeted intrusive ground investigation is required to inform on subsequent stages of design.

9.4 RECOMMENDATIONS

WSP recommends the following actions are undertaken:

- Complete a detailed desk study to assess and potentially zone the UXO hazard level on the site.
- An intrusive ground investigation should be undertaken to assess:
  - Baseline ground conditions at the site and further investigations of contaminant concentrations, ground gas and groundwater monitoring. It should be noted that this investigation could be undertaken post planning submittal.
  - Geotechnical parameters to assist subsequent design.
- Following the ground investigation, an interpretative Ground Investigation Report (GIR) should be produced including an assessment of the risk from contamination at the site and a preliminary geotechnical appraisal.

LIMITATIONS

REPORT LIMITATIONS - GROUND RISK AND REMEDIATION

GENERAL

1. WSP UK Limited has prepared this report solely for the use of the Client and those parties with whom a warranty agreement has been executed, or with whom an assignment has been agreed and outlined in the body of the report.

2. Unless explicitly agreed otherwise, in writing, this report has been prepared under WSP UK Limited standard Terms and Conditions as included within our proposal to the Client.

3. Project specific appointment documents may be agreed at our discretion and a charge may be levied for both the time to review and finalise appointments documents and also for associated changes to the appointment terms. WSP UK Limited reserves the right to amend the fee should any changes to the appointment terms create an increase risk to WSP UK Limited.

4. The report needs to be considered in the light of the WSP UK Limited proposal and associated limitations of scope. The report needs to be read in full and isolated sections cannot be used without full reference to other elements of the report and any previous works referenced within the report.

PHASE 1 GEO ENVIRONMENTAL AND PRELIMINARY RISK ASSESSMENTS

Coverage: *This section covers reports with the following titles or combination of titles: phase 1; desk top study; geo environmental assessment; development appraisal; preliminary environmental risk assessment; constraints report; due diligence report; geotechnical development review; environmental statement; environmental chapter; project scope summary report (PSSR), program environmental impact report (PEIR), geotechnical development risk register; and, baseline environmental assessment.*

5. The works undertaken to prepare this report comprised a study of available and easily documented information from a variety of sources (including the Client), together with (where appropriate) a brief walk over inspection of the Site and correspondence with relevant authorities and other interested parties. Due to the short timescales associated with these projects responses may not have been received from all parties. WSP UK Limited cannot be held responsible for any disclosures that are provided post production of our report and will not automatically update our report.

6. The opinions given in this report have been dictated by the finite data on which they are based and are relevant only for the purpose for which the report was commissioned. The information reviewed should not be considered exhaustive and has been accepted in good faith as providing true and representative data pertaining to site conditions. Should additional information become available which may affect the opinions expressed in this report, WSP UK Limited reserves the right to review such information and, if warranted, to modify the opinions accordingly.

7. It should be noted that any risks identified in this report are perceived risks based on the information reviewed. Actual risks can only be assessed following intrusive investigations of the site.

8. WSP UK Limited does not warrant work / data undertaken / provided by others.

INTRUSIVE INVESTIGATION REPORTS

Coverage: *The following report titles (or combination) may cover this category of work: geo environmental site investigation; geotechnical assessment; GIR (Ground Investigation reports); preliminary environmental and geotechnical risk assessment; and, geotechnical risk register.*

REPORT LIMITATIONS - GROUND RISK AND REMEDIATION

9. The investigation has been undertaken to provide information concerning either:

- **i.** The type and degree of contamination present at the site in order to allow a generic quantitative risk assessment to be undertaken; or
- **ii.** Information on the soil properties present at the site to allow for geotechnical development constraints to be considered.

10. The scope of the investigation was selected on the basis of the specific development and land use scenario proposed by the Client and may be inappropriate to another form of development or scheme. If the development layout was not known at the time of the investigation the report findings may need revisiting once the development layout is confirmed.

11. For contamination purposes, the objectives of the investigation are limited to establishing the risks associated with potential contamination sources with the potential to cause harm to human health, building materials, the environment (including adjacent land), or controlled waters.

12. For geotechnical investigations the purpose is to broadly consider potential development constraints associated with the physical property of the soils underlying the site within the context of the proposed future or continued use of the site, as stated within the report.

13. The amount of exploratory work, soil property testing and chemical testing undertaken has necessarily been restricted by various factors which may include accessibility, the presence of services; existing buildings; current site usage or short timescales. The exploratory holes completed assess only a small percentage of the area in relation to the overall size of the Site, and as such can only provide a general indication of conditions.

14. The number of sampling points and the methods of sampling and testing do not preclude the possible existence of contamination where concentrations may be significantly higher than those actually encountered or ground conditions that vary from those identified. In addition, there may be exceptional ground conditions elsewhere on the site which have not been disclosed by this investigation and which have therefore not been taken into account in this report.

15. The inspection, testing and monitoring records relate specifically to the investigation points and the timeframe that the works were undertaken. They will also be limited by the techniques employed. As part of this assessment, WSP UK Limited has used reasonable skill and care to extrapolate conditions between these points based upon assumptions to develop our interpretation and conclusions. The assumption made in forming our conclusions is that the ground and groundwater conditions (both chemically and physically) are the same as have been encountered during the works undertaken at the specific points of investigation. Conditions can change between investigation points and these interpretations should be considered indicative.

16. The risk assessment and opinions provided are based on currently available guidance relating to acceptable contamination concentrations; no liability can be accepted for the retrospective effects of any future changes or amendments to these values. Specific assumptions associated with the WSP UK Limited risk assessment process have been outlined within the body or associated appendix of the report.

17. Additional investigations may be required in order to satisfy relevant planning conditions or to resolve any engineering and environmental issues.

18. Where soil contamination concentrations recorded as part of this investigation are used for commentary on potential waste classification of soils for disposal purposes, these should be classed as indicative only. Due consideration should be given to the variability of contaminant concentrations taken from targeted samples versus bulk excavated soils and the potential variability of contaminant concentrations between sampling locations. Where major waste disposal operations are considered, targeted waste classification investigations should be designed.

19. The results of the asbestos testing are factually reported and interpretation given as to how this relates to the previous use of the site, the types of ground encountered and site conceptualisation. This does not however constitute a formal asbestos assessment. These results should be treated cautiously and should not be relied

upon to provide detailed and representative information on the delineation, type and extent of bulk ACMs and / or trace loose asbestos fibres within the soil matrix at the site.

20. If costs have been included in relation to additional site works, and / or site remediation works these must be considered as indicative only and must be confirmed by a qualified quantity surveyor.

EUROCODE 7: GEOTECHNICAL DESIGN

21. On 1st April 2010, BS EN 1997-1:2004 (Eurocode 7: Geotechnical Design – Part 1) became the mandatory baseline standard for geotechnical ground investigations.

22. In terms of geotechnical design for foundations, slopes, retaining walls and earthworks, EC7 sets guidance on design procedures including specific guidance on the numbers and spacings of boreholes for geotechnical design, there are limits to methods of ground investigation and the quality of data obtained and there are also prescriptive methods of assessing soil strengths and methods of design. Unless otherwise explicitly stated, the work has not been undertaken in accordance with EC7. A standard geotechnical interpretative report will not meet the requirements of the Geotechnical Design Report (GDR) under Eurocode 7. The GDR can only be prepared following confirmation of all structural loads and serviceability requirements. The report is likely to represent a Ground Investigation Report (GIR) under the Eurocode 7 guidance.

DETAILED QUANTITATIVE RISK ASSESSMENTS AND REMEDIAL STRATEGY REPORTS

23. These reports build upon previous report versions and associated notes. The scope of the investigation, further testing and monitoring and associated risk assessments were selected on the basis of the specific development and land use scenario proposed by the Client and may not be appropriate to another form of development or scheme layout. The risk assessment and opinions provided are based on currently available approaches in the generation of Site Specific Assessment Criteria relating to contamination concentrations and are not considered to represent a risk in a specific land use scenario to a specific receptor. No liability can be accepted for the retrospective effects of any future changes or amendments to these values, associated models or associated guidance.

24. The outputs of the Detailed Quantitative Risk Assessments are based upon WSP UK Limited manipulation of standard risk assessment models. These are our interpretation of the risk assessment criteria.

25. Prior to adoption on site they will need discussing and agreeing with the Regulatory Authorities prior to adoption on site. The regulatory discussion and engagement process may result in an alternative interpretation being determined and agreed. The process and timescales associated with the Regulatory Authority engagement are not within the control of WSP UK Limited. All costs and programmes presented as a result of this process should be validated by a quantity surveyor and should be presumed to be indicative.

GEOTECHNICAL DESIGN REPORT (GDR)

26. The GDR can only be prepared following confirmation of all structural loads and serviceability requirements. All the relevant information needs to be provided to allow for a GDR to be produced.

MONITORING (INCLUDING REMEDIATION MONITORING REPORTS)

27. These reports are factual in nature and comprise monitoring, normally groundwater and ground gas and data provided by contractors as part of an earthworks or remedial works.

28. The data is presented and will be compared with assessment criteria.

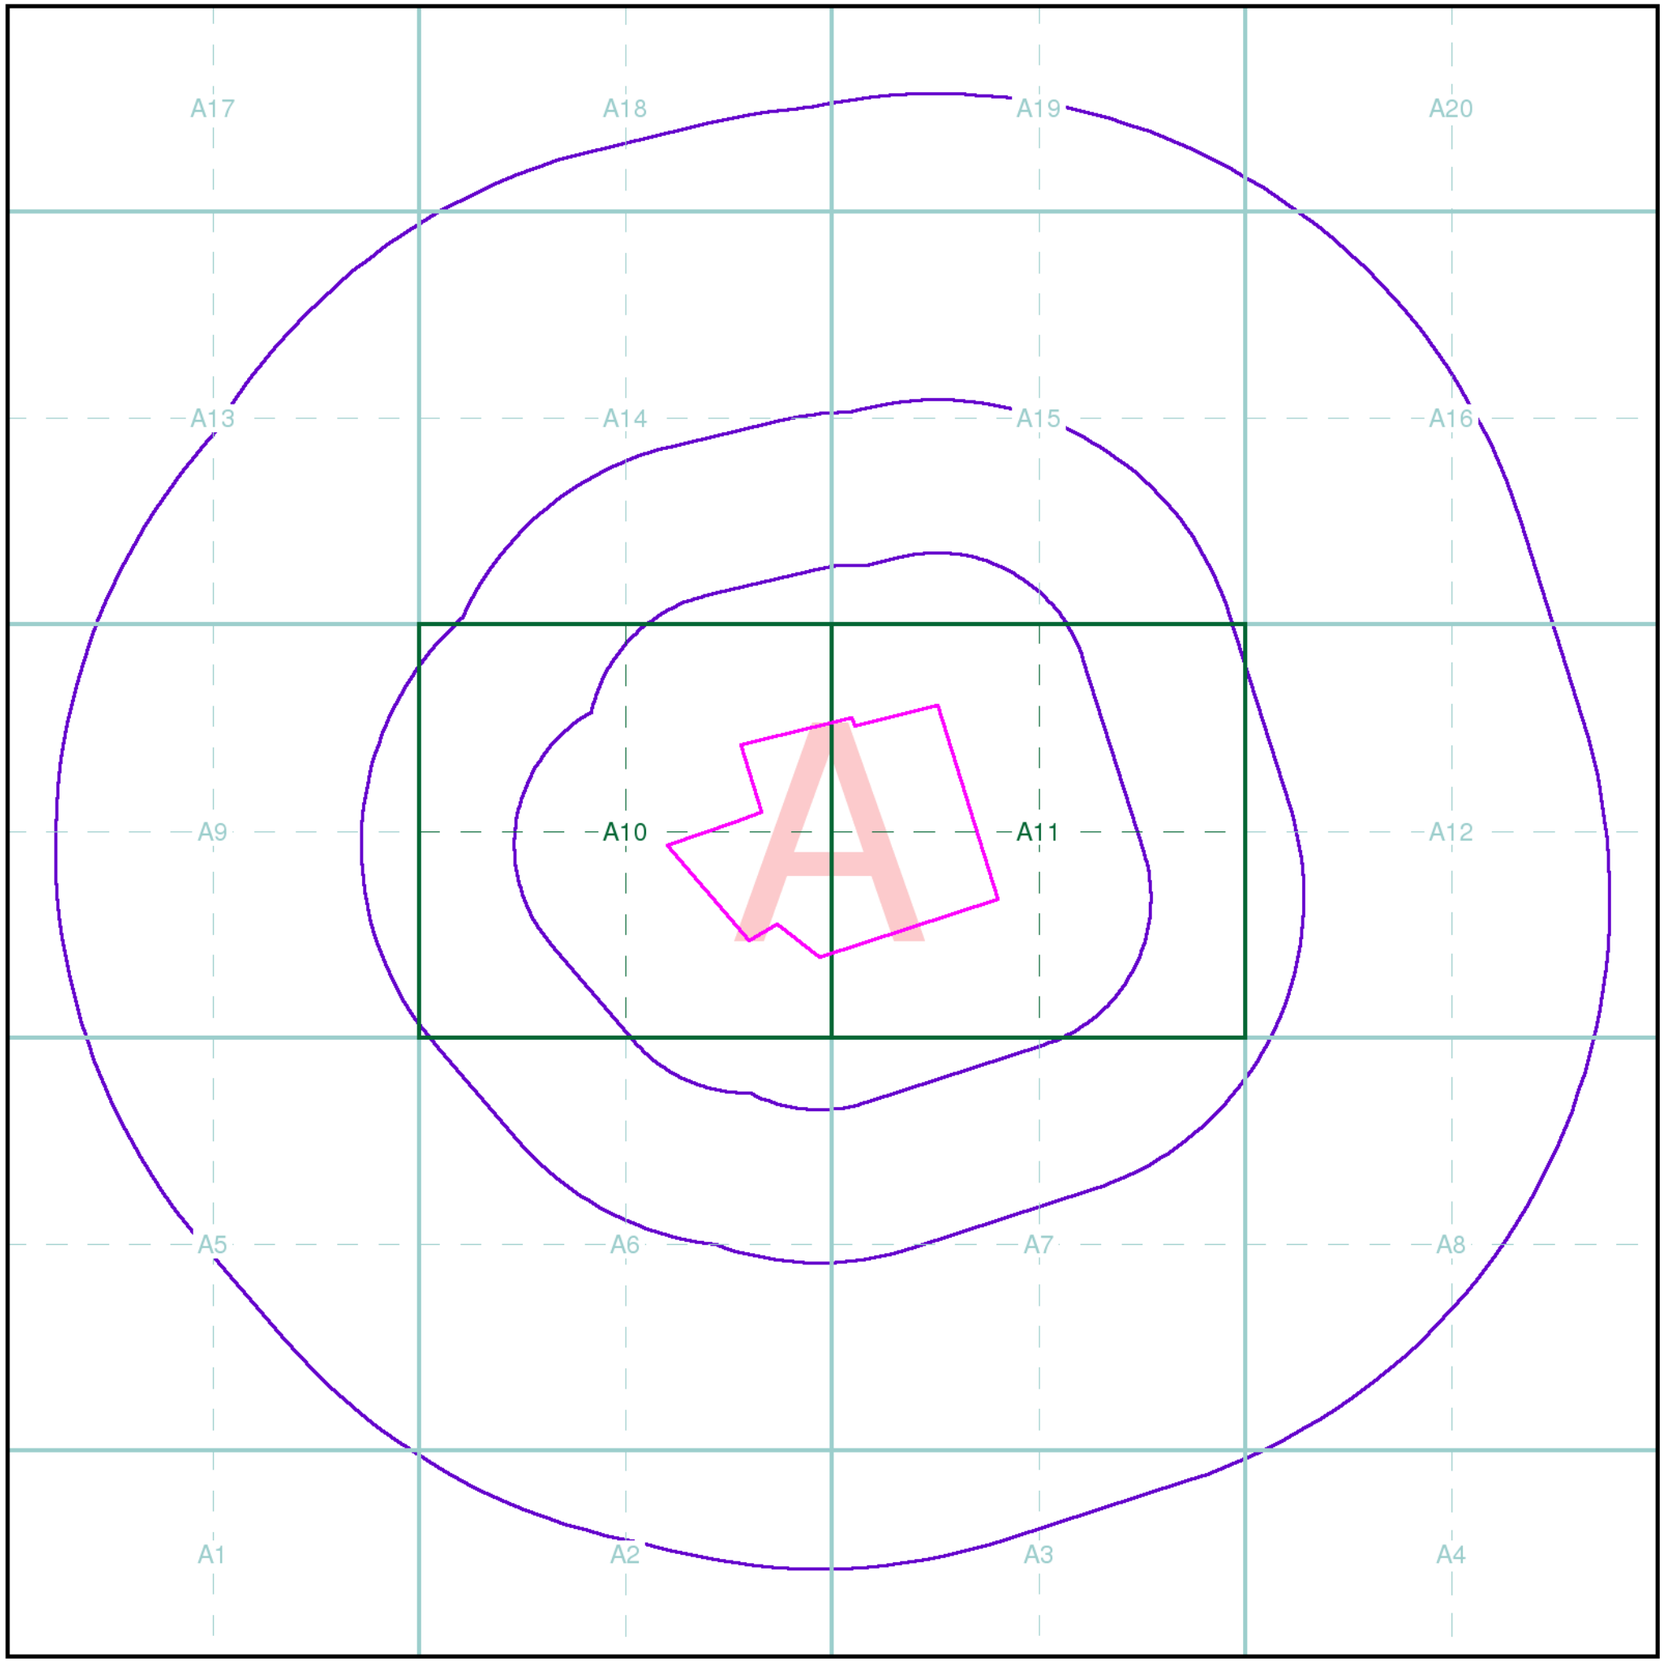
ENVIROCHECK REPORT



Index Map

For ease of identification, your site and buffer have been split into Slices, Segments and Quadrants. These are illustrated on the Index Map opposite and explained further below.

Slice
Each slice represents a 1:10,000 plot area (2.7km x 2.7km) for your site and buffer. A large site and buffer may be made up of several slices (represented by a red outline), that are referenced by letters of the alphabet, starting from the bottom left corner of the slice "grid". This grid does not relate to National Grid lines but is designed to give best fit over the site and buffer.

Segment
A segment represents a 1:2,500 plot area. Segments that have plot files associated with them are shown in dark green, others in light blue. These are numbered from the bottom left hand corner within each slice.

Quadrant
A quadrant is a quarter of a segment. These are labelled as NW, NE, SW, SE and are referenced in the datasheet to allow features to be quickly located on plots. Therefore a feature that has a quadrant reference of A7NW will be in Slice A, Segment 7 and the NW Quadrant.

A selection of organisations who provide data within this report:

Envirocheck reports are compiled from 136 different sources of data.

Introduction

The Environment Act 1995 has made site sensitivity a key issue, as the legislation pays as much attention to the pathways by which contamination could spread, and to the vulnerable targets of contamination, as it does the potential sources of contamination.
For this reason, Landmark's Site Sensitivity maps and Datasheet(s) place great emphasis on statutory data provided by the Environment Agency/Natural Resources Wales and the Scottish Environment Protection Agency; it also incorporates data from Natural England (and the Scottish and Welsh equivalents) and Local Authorities; and highlights hydrogeological features required by environmental and geotechnical consultants. It does not include any information concerning past uses of land. The datasheet is produced by querying the Landmark database to a distance defined by the client from a site boundary provided by the client.
In this datasheet the National Grid References (NGRs) are rounded to the nearest 10m in accordance with Landmark's agreements with a number of Data Suppliers.

Geology 1:50,000 Maps

This report contains geological map extracts taken from the BGS Digital Geological map of Great Britain at 1:50,000 scale and is designed for users carrying out preliminary site assessments who require geological maps for the area around the site. This mapping may be more up to date than previously published paper maps.
The various geological layers - artificial and landslip deposits, superficial geology and solid (bedrock) geology are displayed in separate maps, but superimposed on the final 'Combined Surface Geology' map. All map legends feature on this page. Not all layers have complete nationwide coverage, so availability of data for relevant map sheets is indicated below.

Artificial Ground and Landslip

Artificial ground is a term used by BGS for those areas where the ground surface has been significantly modified by human activity. Information about previously developed ground is especially important, as it is often associated with potentially contaminated material, unpredictable engineering conditions and unstable ground.

Artificial ground includes:

- Made ground - man-made deposits such as embankments and spoil heaps on the natural ground surface.
- Worked ground - areas where the ground has been cut away such as quarries and road cuttings.
- Infilled ground - areas where the ground has been cut away then wholly or partially backfilled.
- Landscaped ground - areas where the surface has been reshaped.
- Disturbed ground - areas of ill-defined shallow or near surface mineral workings where it is impracticable to map made and worked ground separately.

Mass movement (landslip) deposits on BGS geological maps are primarily superficial deposits that have moved down slope under gravity to form landslips. These affect bedrock, other superficial deposits and artificial ground. The dataset also includes foundered strata, where the ground has collapsed due to subsidence.

Superficial Geology

Superficial Deposits are the youngest geological deposits formed during the most recent period of geological time, the Quaternary, which extends back about 1.8 million years from the present.

They rest on older deposits or rocks referred to as Bedrock. This dataset contains Superficial deposits that are of natural origin and 'in place'. Other superficial strata may be held in the Mass Movement dataset where they have been moved, or in the Artificial Ground dataset where they are of man-made origin.

Most of these Superficial deposits are unconsolidated sediments such as gravel, sand, silt and clay, and onshore they form relatively thin, often discontinuous patches or larger spreads.

Bedrock and Faults

Bedrock geology is a term used for the main mass of rocks forming the Earth and are present everywhere, whether exposed at the surface in outcrops or concealed beneath superficial deposits or water.

The bedrock has formed over vast lengths of geological time ranging from ancient and highly altered rocks of the Proterozoic, some 2500 million years ago, or older, up to the relatively young Pliocene, 1.8 million years ago.

The bedrock geology includes many lithologies, often classified into three types based on origin: igneous, metamorphic and sedimentary.

The BGS Faults and Rock Segments dataset includes geological faults (e.g. normal, thrust), and thin beds mapped as lines (e.g. coal seam, gypsum bed). Some of these are linked to other particular 1:50,000 Geology datasets, for example, coal seams are part of the bedrock sequence, most faults and mineral veins primarily affect the bedrock but cut across the strata and post date its deposition.

Combined Surface Geology

The Combined Surface Geology map combines all the previous maps into one combined geological overview of your site.

Please consult the legends to the previous maps to interpret the Combined "Surface Geology" map.

Additional Information

More information on 1:50,000 Geological mapping and explanations of rock classifications can be found on the BGS website. Using the LEX Codes in this report, further descriptions of rock types can be obtained by interrogating the 'BGS Lexicon of Named Rock Units'. This database can be accessed by following the 'Information and Data' link on the BGS website.

Published 1881

Source map scale - 1:10,560

The historical maps shown were reproduced from maps predominantly held at the scale adopted for England, Wales and Scotland in the 1840`s. In 1854 the 1:2,500 scale was adopted for mapping urban areas; these maps were used to update the 1:10,560 maps. The published date given therefore is often some years later than the surveyed date. Before 1938, all OS maps were based on the Cassini Projection, with independent surveys of a single county or group of counties, giving rise to significant inaccuracies in outlying areas. In the late 1940`s, a Provisional Edition was produced, which updated the 1:10,560 mapping from a number of sources. The maps appear unfinished - with all military camps and other strategic sites removed. These maps were initially overprinted with the National Grid. In 1970, the first 1:10,000 maps were produced using the Transverse Mercator Projection. The revision process continued until recently, with new editions appearing every 10 years or so for urban areas.

10k Raster Mapping

Published 1999

Source map scale - 1:10,000

The historical maps shown were produced from the Ordnance Survey`s 1:10,000 colour raster mapping. These maps are derived from Landplan which replaced the old 1:10,000 maps originally published in 1970. The data is highly detailed showing buildings, fences and field boundaries as well as all roads, tracks and paths. Road names are also included together with the relevant road number and classification. Boundary information depiction includes county, unitary authority, district, civil parish and constituency.
