## Annual Report to Parliament on the monitoring programme for transmissible spongiform encephalopathies (TSEs) – years 2021 and 2022

Introduction.....	1
Bovine Spongiform Encephalopathy (BSE) in cattle.....	1
Scrapie in sheep and goats.....	2
Chronic Wasting Disease (CWD) in cervids.....	3
Annex 1: BSE testing of cattle 2021.....	4
Annex 2: BSE testing of cattle 2022.....	10
Annex 3: Scrapie - test results and related data 2021.....	16
Annex 3a: Scrapie - positive results - date of birth, location, breed, genotype 2021.....	18
Annex 3b: Scrapie - suspect cases - flocks 2021.....	22
Annex 4: Scrapie - test results and related data 2022.....	23
Annex 4a: Scrapie - positive results - date of birth, location, breed, genotype 2022.....	25
Annex 4b: Scrapie - suspect cases - flocks 2022.....	29

## Introduction

Regulation (EC) No 999/2001, as retained at exit from the European Union (EU), lays down rules for the prevention, control and eradication of transmissible spongiform encephalopathies (TSEs) in livestock. These consist of bovine spongiform encephalopathy (BSE) ('mad cow disease'), scrapie which affects sheep and goats, and chronic wasting disease (CWD), which affects cervids.

Article 6 of retained Regulation (EC) No 999/2001 sets out the requirement for an annual monitoring programme for TSEs based on active and passive surveillance. The surveillance programme monitors the level of BSE, in particular, over time and thereby checks the continued effectiveness of the BSE controls. Article 6 also requires that the appropriate authority must, where possible, submit to their relevant Parliament an annual report for each calendar year on this monitoring programme.

Prior to EU exit the regulation required the annual report to be submitted to the European Commission to contribute to a consolidated European Union report. This provision was amended at EU exit by the Transmissible Spongiform Encephalopathies and Animal By-Products (Amendment etc.) (EU Exit) Regulations 2019 (SI 2019/170). The report therefore covers data for Great Britain (England, Scotland and Wales) in 2021 and 2022.

The information required is set out in Annex III, Chapter B, Part I (Reporting and recording requirements: requirements on appropriate authorities) of the retained regulation (as amended). Most of the data, from 2007 onwards, is available on GOV.UK, and has been provided via this webpage since 2015: <https://www.gov.uk/government/publications/active-tse-surveillance-statistics>.

This data is updated monthly.

## Bovine Spongiform Encephalopathy (BSE) in cattle

Under our robust surveillance programme, approximately 100,000 BSE tests are undertaken annually. Bovine animals are tested for BSE if they are born in the UK or in an EU country other than Romania or Bulgaria and:

- the animal is aged over 48 months and showed **signs of sickness** when examined by a veterinarian before death
- the animal is aged over 48 months and has been sent for **emergency slaughter** (for example, casualty animals which do not appear to be unwell, but have broken a leg or suffered some other injury)
- the animal is aged over 48 months and is **fallen stock**, that is, their death was not due to being slaughtered for human consumption

- the animal is older than 30 months and killed for the farmer's private consumption: **'home kill'**

In addition, our surveillance programme requires:

- BSE testing of bovine animals slaughtered for human consumption at abattoir if they were born in Romania, Bulgaria, or any non-EU country and they were older than 30 months and healthy at the time of slaughter
- BSE testing of bovine animals that are fallen stock, were sent for emergency slaughter or showed signs of sickness when examined by a veterinarian before death that were born in Romania, Bulgaria or any non-EU country and were older than 24 months at the time of death

The data for the calendar years 2021 and 2022 is in annexes 1 and 2.

The data includes a small number of bovine animals that were aged below 48 months, as tests are sometimes performed before the age of the animal can be verified. There are also a small number of bovine animals of unknown age due to their birth pre-dating the introduction of passports or failure by keepers to record them. All these animals were **'fallen stock'** which do not enter the food chain.

During the period covered by these reports, there was **1** confirmed BSE case in 2021 in Somerset of **1 cow** which was tested as fallen stock aged over 48 months. The youngest **2** offspring of this animal were placed under official restrictions and were culled, sampled, and tested for BSE, as required by legislation, both with negative results.

A total of **68** 'cohort' animals were identified. Cohort animals are those born in the same herd as the affected bovine animal within 12 months preceding or following the date of birth of that animal, and animals which at any time during the first year of their lives were reared together with the affected bovine animal during the first year of its life. As required by legislation, all the cohort animals were placed under official restrictions and were culled, sampled, and tested for BSE, all with negative results.

These animals are captured within the 2021 data under **'BSE culling'**.

## Scrapie in sheep and goats

We monitor the level of scrapie in the national sheep flock and the national goat herd with a programme of active surveillance in line with legislative requirements. This programme monitors the continued effectiveness of our scrapie controls. It consists of the annual testing for TSE of 20,000 healthy and fallen sheep aged over 18 months, of which at least 5,000 are healthy animals slaughtered for human consumption, and 500 fallen stock goats.

Holdings under scrapie control and eradication measures are also monitored under the Compulsory Scrapie Flock Scheme (CSFS) which applies where cases of classical or atypical scrapie are confirmed. Unlike classical scrapie which affects younger animals and is highly contagious, atypical scrapie usually affects individual animals older than 5 and is believed to be spontaneous.

Under the CSFS there are strict testing requirements. Animals aged over 18 months going for slaughter must be sent to designated abattoirs, where they are sampled and tested for scrapie. Animals aged over 18 months which die or are killed on the farm must also be sampled and tested.

The data for the calendar years 2021 and 2022 is in annexes 3 and 4 which sets out the numbers of sheep and goats tested under both our national surveillance programme and the CSFS.

The data shows a small number of confirmed cases of atypical scrapie along with the additional information required by the legislation for each individual case. There were no confirmed cases of classical scrapie.

## **Chronic Wasting Disease (CWD) in cervids**

Retained Regulation (EC) No 999/2001 also applies to CWD, but we are not required by the legislation to have an active surveillance programme. Like BSE and scrapie, the disease is notifiable, meaning that it must be reported to the competent authority on suspicion: tests will be carried out on any suspect cases. We are required to include information on the number of samples tested and confirmed cases in the annual report. In 2021 there was one case of a roe deer showing clinical signs compatible with TSE, which was tested in order to rule out TSE. The test was negative. There have been no confirmed cases of CWD in the UK to date.

## Annex 1: BSE testing of cattle 2021

### (1) England

BSE survey	Age class by month	Number of animals tested	Result of test

## Annex 3b: Scrapie - suspect cases - flocks 2021

### Number of suspected cases placed under official movement restrictions

Sheep	Goats
2	0

### Number of flocks where suspected cases in ovine and caprine animals have been reported and investigated

Goats	Mixed	Sheep SHC
0	0	>3

- SHC: slaughtered for human consumption
- >: indicates a minimum number where there are significant numbers submitted without location recorded

### Number of ovine and caprine flocks tested

Sheep FS	Sheep EM	Goats SHC	Goats FS	Goats EM
>5100	44	0	>245	1

- FS: fallen stock
- EM: emergency slaughter

## Annex 4: Scrapie - test results and related data 2022

**Table 1**

Year	Scrapie Survey	Number of animals tested	Number of animals tested with an atypical result	Number of animals tested in which scrapie is not confirmed	Number of animals tested in which scrapie is confirmed
2022	Sheep abattoir survey	7603	2	7601	0
2022	Sheep fallen stock survey	12005	8	11997	0
2022	Suspect case reported by farmer	3	1	2	0
2022	Goat fallen stock survey	504	0	504	0
<b>2022</b>	<b>Total sheep tested</b>	<b>19611</b>	<b>11</b>	<b>19600</b>	<b>0</b>
<b>2022</b>	<b>Total goats tested</b>	<b>504</b>	<b>0</b>	<b>504</b>	<b>0</b>

**Table 2**

Year	Compulsory Scrapie Flock Scheme (Sheep & Goats)	Number of animals tested	Number of animals tested with an atypical result	Number of animals tested in which scrapie is not confirmed	Number of animals tested in which scrapie is confirmed
