IVA N2 / N3 Inspection Manual	Document uncontrolled when printed

This page intentionally left blank

Version Control & Release Notes

Foreword

This Manual is a detailed guide on the examination of vehicles submitted to an authorised site under the Individual Vehicle Approval (IVA) scheme.

It is produced for the examiners who carry out the examinations and for vehicle presenters and other interested parties who wish to familiarise themselves with the technical requirements and examination procedures.

Application

The IVA scheme is one of three routes for a road vehicle to gain approval and thereby obtain licensing and registration in UK.

The IVA route is open to vehicles falling under the following categories:

M1, M2, M3,

N1, N2, N3

01, 02, 03, 04

This manual covers solely the IVA technical requirements for vehicles of the following categories:

Motor vehicles with at least four wheels used for the carriage of goods.

N2: Vehicles used for the carriage of goods and having a maximum mass exceeding 3.5 tonnes but not exceeding 12 tonnes.

N3: Vehicles used for the carriage of goods and having a maximum mass exceeding 12 tonnes.

For information on other vehicle categories, the following DVSA IVA inspection manuals should be consulted.

- The Passenger Vehicle IVA Inspection Manual for vehicle category M1
- The Light Goods Vehicle IVA Inspection Manual for vehicle category N1
- The Bus and Coach IVA Inspection Manual for vehicle categories M2 and M3
- The Trailer IVA Inspection Manual for categories O1, O2, O3 and O4

Obligatory Individual Approval Certificates

The IVA scheme is one of three routes for a road vehicle to gain approval and thereby obtain licensing and registration in UK. For N2 and N3 category vehicles the other two routes are: European Whole Vehicle Type Approval (ECWVTA), and National Small Series Type Approval (NSSTA). Refer to the Road Vehicles (Approval) Regulations 2020 (SI 2020 No. 818) for more information.

Approval Process

With the IVA examination, the onus is on the applicant to provide evidence of compliance. This can, for example, be in the form of manufacturer's markings on the vehicle or component, an EC certificate of conformity for an incomplete or base vehicle and details of the systems approved, documentary evidence from the competent authority in the country of origin or the manufacturer, submission of a test report from an accredited Technical Service or a combination of such elements, and it may also include a degree of visual examination and practical tests. Applicants may be required to dismantle certain parts of the vehicle to allow DVSA examiners to carry out a full and meaningful examination.

Applications and supportive documentation will be assessed prior to the issue of an appointment. Examination of the vehicle will include verification checks to confirm as far as possible compliance with the required standards.

A vehicle built to a later Regulation or Directive that that stipulated in the "Summarised Table of requirements for vehicles" will be acceptable for IVA examination.

Where evidence of compliance is supplied, and no obvious modification has been carried out – assume compliance has been met.

The physical examination criterion for this part of the process is contained in sections 1 to 69 of this manual.

Scope of inspection

The design and construction requirements applicable to new road vehicles are contained within the Road Vehicles (Approval) Regulations 2020. The inspection procedures within this manual have been developed to assess as far as practicable the ability of the vehicle to comply with those Regulations. This manual is however not a legal interpretation of the Regulations.

The issue of an Approval Certificate should not be taken as absolute evidence that the vehicle can legally be used on the road, since there may be other applicable requirements contained in other regulations.

Examiners are not required to carry out a roadworthiness inspection but where obvious safety defects are noted the vehicle may be subject to prohibition action, The IVA certificate will not be issued and where applicable it may be indicated on the IVA 30 (refusal to issue a certificate) that a relevant section of the inspection was "Unable to be assessed fully" due to the condition of an item.

The condition of an item in isolation is not a reason for an item failing to meet the requirements. However, if the condition of an item is such that a meaningful assessment cannot be made, then the IVA 30 should indicate that the applicable section/area was unable to be assessed and state the reason for this action.

NOTE: The vehicle will be assessed for compliance in all modes of operation (as required for normal road use), for example, in the case of a lifting axle, with the axle up and down / if dual fuelled, when running on each separate fuel source etc unless otherwise specified.

Method of Inspection

The examination will be limited to parts of the vehicle which can be readily seen without dismantling. However, the presenter might be required to open lockable compartments and remove engine covers, inspection/access panels, trims, or carpeting, etc. and tilt the vehicles cab in order to gain access to items subject to examination.

The visual assessment of certain items e.g., seat belt anchorages (which in Type Approval undergo a physical test) might not always be sufficient to satisfy the examiners that the vehicle complies with the requirements of the regulations. In such circumstances the onus is on the applicant to demonstrate, for example, by the production of satisfactory test result documentation, or (by arrangement), during construction, of the inspection of relevant structural elements, that the vehicle complies with the requirements of the regulations.

In some areas of the inspection, evidence that the vehicle complies with the relevant criteria may be submitted in the form of documentation. This can, for example, be satisfactory evidence that the vehicle complies with the relevant requirements of a European Directive.

For any technical subject, an appropriate type approval certificate or a test report from a recognised test house will be accepted as an alternative provided that the vehicle can be identified as belonging to the type to which the documentation refers.

In certain cases, calculations will be required to prove compliance. Where these are required they should be submitted with the application for inspection to Technical Services Branch for verification prior to the inspection. Failure to produce these calculations may delay or prohibit the inspection appointment being confirmed.

If the examiner has any doubts over any item covered by documentary evidence, calculations, or declarations, they have the right to ask for the original copies of these approvals / declarations which were accepted at time of application, to compare against the vehicle they are inspecting.

Use of this manual

The manual has been arranged in the same order to reflect the Framework Regulation from which the inspection criteria are derived. Each inspection area broadly covers the requirements that vehicles must meet or exceed based upon the National IVA scheme.

General Construction is a section that does not explicitly exist in EWVTA, rather it is implicit that unsafe vehicles are not permitted to be approved.

Note: For areas where documentary evidence is not required all vehicles will be subject to a visual inspection as detailed within the method of inspection.

Special Purpose Vehicles. (SPV)

Certain vehicles are classified as Special Purpose Vehicles They <u>may</u> be subject to additional exemptions from the required standards but only where the special function of the vehicle <u>makes it impossible to comply</u>.

a. Armoured Vehicle

A vehicle intended for the protection of conveyed passengers and/or goods and complying with armour plating anti-bullet requirements.

"Anti - bullet requirements" shall be interpreted as meaning: the driver and passenger compartment (front, rear and sides including doors and glazing are capable of withstanding ballistic penetration from small arms fire. E.g., materials to EN 1063 or an equivalent level of protection.

b. Mobile Crane (see Special Types General Order Section below)

A vehicle of N3 category not fitted for the carriage of goods, provided with a crane whose lifting moment is equal to or higher than 400kNm.

(Evidence from the crane manufacture will be required)

c. Snow Plough

A vehicle designed for clearing snow and ice from roads,

d. Recovery Vehicle (see Special Types General Order Section below)

A vehicle fitted with equipment to lift a vehicle partly off the ground and tow it, and not able to carry any other load other than necessary equipment;

e. Electric Vehicle

A vehicle powered purely by electricity and designed for a special purpose (e.g., milk float).

f. Road Sweeper

A vehicle fitted with specialised equipment for sweeping streets.

(Purpose-built compact road sweepers are exempt from approval if they can be classed as mobile machinery and comply with the relevant requirements for such machinery)

g. Abnormal Indivisible Load Vehicle (see Special Types General Order Section below)

A vehicle which is designed to carry loads which are over the maximum vehicle dimensions or weights specified in Section 48.

N.B. Vehicles fitted with specialised equipment may be subject to additional exemption where specified in the EC Framework Directive on items normally assessed by visual inspection only, (i.e., not subject to mandatory Directive compliance.) Applicants requesting such exemptions should at the time of application, submit to DVSA any vehicle specific documentary evidence supporting any such request.

Special Types General Order

The following special vehicles that are regulated under Great Britain's legislation for *special* (including extra-large) vehicle types ("STGO") fall in scope of this manual:

a. Abnormal Indivisible Load (AIL) vehicles – vehicles that are designed to carry a bulky or heavy load that cannot safely be carried on regular vehicles meeting the 'normal' regulations C&U and Authorised weight regulations.

Quick summary table

	Normal size	Wide (> 2.55m or 2.75m for locomotive), and/or long (> 12m)	Super-size: >6.1m wide, or 30m long
Normal weight	C&U	STGO (Cat 1)	VSO
Cat 1 weights:	Plating	STGO	VSO
<50T (std axle	&Testing*,		
weights)	STGO		
Cat 2 <80T	P&T*, STGO	STGO %	VSO
Cat 3 <150T	P&T*, STGO	STGO %	VSO
Exceeds 150T	STGO	STGO %	VSO

^{* -} unless a locomotive

- **b.** Road Recovery Vehicle (RRV) an N3 vehicle or combination of vehicles (N3/O4) used to lift and recover another vehicle, where the normal C&U limits are exceeded, and intended to be taxed as a recovery vehicle.
- **c.** Engineering plant (EP) vehicles based on lorry chassis which do not carry any goods, only fixed machinery, or equipment, and which are not cranes. It must not be possible for the engineering function to be carried out by a vehicle complying in all respects with C&U regulations. Some vehicles commonly classed as plant or engineering plant (e.g., JCB diggers, excavators.) which are not based on a lorry chassis are classed as Mobile Machinery and exempt from approval or IVA.
- **d. Mobile Cranes (MC)** vehicles based on a lorry chassis which includes extremely large elevating work platforms as well as more typical cranes. These vehicles only fall in scope of STGO where they exceed the normal dimensions and weights of a road vehicle. (A van-based elevating work platform is not within STGO).

In addition, this manual covers two other categories planned for inclusion in STGO which at present still require a Vehicle Special Order (VSO) to authorise each vehicle

^{% -} exempt from Spray suppression

e. Impact protection vehicles (Crash Cushion) – vehicles specially designed for use in high speed traffic (e.g., laying out cones on the motorway) with a protective deployable rear "crash cushion".

f. Crane ballast vehicles – vehicles designed to carry the ballast required by mobile cranes. These are carrying a divisible load which is very heavy, but nevertheless are permitted in the interests of avoiding the need for two or more vehicles carrying ballast to follow the crane.

Refusal to examine

The examination of a vehicle may be refused for any of the following reasons

- the vehicle is not submitted for examination at the time and place appointed
- the correct fee has not been paid
- the vehicle submitted for examination is of the incorrect category
- the vehicle cannot be driven or has insufficient fuel or oil to enable the test to be completed
- the vehicle is presented in a dirty or dangerous condition such as to make it unreasonable for the examination to be carried out
- a load or items on the vehicle are not secured or removed as requested
- a proper examination cannot be carried out because any door, tailgate, boot lid, engine cover, fuel cap or other device designed to be readily opened cannot be opened
- the condition of the vehicle (in the opinion of the examiner) is such that proper examination of the vehicle would involve a danger of injury to any person or damage to the vehicle or any other property
- there was no means of identifying the vehicle, i.e., the vehicle identification number was missing or did not relate to the vehicle, or where evidence indicates that the VIN has been tampered with to change the identity of the vehicle
- the presenter does not remain in the vehicle or its vicinity and operate the controls, drive the vehicle or to remove, refit panels as requested to allow a meaningful examination of the vehicle or is uncooperative.

Run Lock

Run Lock systems will be considered on a case by case basis

Age Related IVA

IVA for N2/N3 Vehicles manufactured before 29th April 2009 up to a maximum of 25 years old

Purpose of this document

To describe the policy and procedures for IVA to be followed in order for N2/N3 vehicles up to 25 years old to become approved for registration following the implementation of ECWVTA. Vehicles over 25 years old do not require type approval or IVA before registration, although they will require submission to DVSA for a Plating examination and first annual test. (unless manufactured before 1968).

Previously used vehicles under IVA.

An application will be assessed to make sure that the vehicle receives the correct level of inspection:

- N2 or N3 vehicle manufactured on or after the introduction of the Road Vehicles (Approval) Regulations 2009 will be required to meet the standards as laid down by the approval regulations (April 29th 2009).
- N2 or N3 vehicles manufactured before 29th April 2009 will be eligible for IVA using Retrospective Directive Requirements.

Ethos of IVA for older vehicles

Vehicles (up to 25 years old) which can no longer be approved via the GVNTA route will now require to be approved using the IVA scheme, these vehicles will also be subject to an Annual Test (MOT) or if exempt Testing and Plating a full roadworthiness check.

Scope of IVA inspection carried out on vehicles up to 25 years old

Importantly, most elements of the current IVA inspection (latest levels as per RVAR 2009) will apply, with only the 6 areas covered by GVNTA differing from the conventional IVA requirements, these Age-related standards are detailed below. All age related exemptions are shown in the relevant sections of the IVA Manual.

Vehicles will be tested based on their date of manufacture. Where only the **year** of manufacture is known, assume a date of 1 January in the relevant year. For vehicles which have been previously used overseas or by the armed forces, the date of manufacture should be used as the "date of first use" when submitted for annual inspection.

Scope of Goods Vehicle National Type Approval GVNTA

GVNTA covers 6 main areas of compliance. These are;

- Emissions (Diesel and Petrol, including Smoke for diesels)
- Radio interference suppression
- Brakes
- Noise
- Speed Limiter
- Tyre Noise

Additional Information

A provisional Technical Record will have been created for this type of vehicle and a plating exercise is required. On completion of the exercise the IVA Certificate number must be entered in the notes section of the provisional record before it is changed to confirmed.

A Plating Certificate VTG6A / VTG7A should be issued where required.

Pre-April 2009 vehicles require only an installation check of the Rear under run protective device as per Section 03B of this manual.

Vehicles manufactured from 10 July 2011 must be fitted with Conspicuity Markings meeting the requirements of Section 21 of this manual.

01 Noise

Application: All Vehicles (Electric Vehicles – RS7 only)

Method of Inspection	Required Standard
The examiner will ensure that the evidence is relevant to the vehicle as presented for test .	 The vehicle as presented must be accompanied by satisfactory evidence of compliance with the required standard for "Noise" (see Notes 1, 2 & 3)
Note 1: Only a minor modification to the exhaust system is allowed. If modified the noise must be assessed with a static noise test. Minor modification means:	2. The exhaust system must be fitted with a silencer.
A change to length of tail pipe after the last silencer of more than 2 metres. (Any change up to 2 metres is allowed and would not	3. The exhaust system must be securely mounted.4. Exhaust system components must be secure.
 require a noise test to be carried out). Any change in the length of exhaust pipe forward of the last silencer. 	The exhaust outlet must be positioned so that exhaust gases cannot damage other components of the vehicle or cause a hazard to people in the vehicle.
Any significant change in the direction the exhaust pipe outlet faces i.e., Original: outlet was to the offside, now positioned to the rear.	6. There must be no leaks from the exhaust system (see Note 4).
Any change other than to pipe work length, i.e., new silencer or other equipment, change in pipe diameter etc, means that a new approval test is required.	7. Where an air braking system has been modified, any high pressure brake exhaust outlet must be fitted with a silencer, or satisfactory evidence supplied to show compliance with the required standard. (see Note 5).
Note 2: STGO Categories - Abnormal Indivisible Load (with a GTW of at least 120,000kg) and Road Recovery Vehicles do not have to comply with RS 1, but must meet RS 2 - 8	Where the exhaust system has had a minor modification 8. The measured sound level must not exceed 99dbA (see Notes 6
Note 3: An auxiliary engine will not be subject to the IVA Noise requirement.	& 7).
Note 4: Manufacturers drain holes are permitted in the system.	
	Noise 04

Noise 01

Method of Inspection	Required Standard
Note 5: Where a modification has been carried out to the air braking system a test report must confirm that the vehicle complies with the directive listed in the front of this manual or an inspection to confirm that air brake silencers are fitted to all additional or modified air brake exhaust outlets.	
Note 6 : Where examiners are required to undertake a noise test, they should refer to the appropriate work instruction for details of how the test should be conducted.	
Note 7 : Where the examiner has doubts that the vehicle noise test result may be falsely low then evidence of compliance must be supplied.

02 Emissions

Application: All Vehicles fitted with piston engines used for the propulsion of the vehicle

Method of Inspection

Ensure that the vehicle **as presented** has satisfactory evidence of compliance to the required standard and has not been subject to modifications that may invalidate the approval.

An EC type-approval issued to the most representative base vehicle remains valid irrespective of change in reference weight. (e.g., due to addition of armour plating).

Where evidence of compliance has been provided, subsequent modification to the exhaust system will be permitted providing

- it is to the exhaust system after the last silencer; and
- the emissions control device is identical to that fitted before the modification. (as listed on an original approval or test report)

This is not applicable to Age Related IVA vehicles as normal wear and tear is most likely to have resulted in exhaust system replacement.

STGO - Abnormal Indivisible Load Vehicles (GTW of at least 120,000kg) only require a declaration from the engine manufacturer that the required standard is met i.e. Euro 5.

Note 1: A mobile crane may comply with Directive 2006/42 for Non-Road Mobile Machinery Emissions, instead of the listed standards.

Required Standard

- An N2 vehicle as presented must be accompanied by satisfactory evidence of compliance with the required standard for either 'Light duty emissions' or Heavy duty 'Emissions'. (See Table 1).
- An N3 vehicle as presented must be accompanied by satisfactory evidence of compliance with the required standard for 'Heavy duty Emissions'. (see Table 1 and Note 1).
- **3.** The exhaust must not emit excessive smoke or vapour of any colour to an extent likely to obscure the vision of other road users.

03A Fuel Tanks

Application: All Vehicles

Method of Inspection	Required Standard
Ensure that the vehicle as presented has satisfactory evidence of compliance to the required standard and carry out an installation check ensuring there appears to be no modifications present that would invalidate the evidence.	The vehicle as presented must be accompanied by satisfactory documentary evidence with the required standard for "Fuel Tanks." (see Note 1).
	Installation Check
Fuel Tanks	
The requirements for liquid fuel tanks apply only to fuel tanks used primarily for the propulsion of the vehicle.	A fuel tank must not be located in, or form part of an occupant compartment or other compartment integral with it.
Vehicles that require an Age Related IVA only have to comply with the Installation Check.	3. There must not be an aperture in a partition separating the occupant compartment from the fuel tank that would allow fuel to flow freely into
The required standard for Gaseous Fuels:	the occupant compartment during normal conditions of use.
ECE 67.01 – LPG fuel systems. or	4. The fuel filler opening must not be located in the occupant, luggage, or engine compartment.
ECE 115.00 - Retrofit LPG fuel systems	
 Requires compliance with the installation requirements of ECE 67.01. or 	5. The fuel tank must be securely attached to the vehicle.
An Installation Certificate from an Approved Installation Engineer;	6. The fuel tank must be positioned so it is protected from damage from protruding parts or sharp edges in the event of a front or rear impact.
A Comparable Standard for LPG ECE 110.00 – CNG fuel systems, or	7. The fuel tank must be mounted so as not to be fouled by moving parts of the vehicle, or likely to be subject to abrasion by adjacent parts.
ECE 115.00 – Retrofit CNG fuel systems Requires compliance with the installation requirements of	8. The tank must not be mounted in a position that would allow any fuel leaking from the tank or pipe work into the occupant compartment. Output Description:
ECE 110.00., or	9. Any fuel filler neck or vent must not allow spilt fuel to be able to fall
An Installation Certificate from an Approved Installation Engineer;	onto the exhaust system.

Tractors for articulated vehicles	Exempt	, , , , , , , , , , , , , , , , , , ,
Gritter (vehicle fitted at the rear with apparatus for spreading material on a road)	Exempt	 The width of the rear under-run must extend to within 100mm of the width of the rear axle on either side (see Notes 2 & 3).
Vehicle transporters (vehicles specially designed and constructed to carry other vehicles loaded on from the	Exempt if the lower edge of the loading platform / bed structure is 550mm or less	 The rear under-run criteria must be met as close to the rear of the vehicle as possible and must be capable of fulfilling its function (see Note 5).
rear)		8. The section height of the rear under-run must not be less than 100mm.

Rear Protective Devices (Under Run) 03B

Method of Inspection		Required Standard
Vehicle type	Exemption Provided	
Concrete / Volumetric Mixers & pumping vehicles*	Exempt if the operation of equipment is compromised by the fitment of an underrun	The outer ends of the rear under-run must be rounded on the outside and have a radius of curvature of not less than 2.5mm.
Coal delivery vehicles fitted with a rear mounted conveyor	Exempt if the operation of equipment is compromised by the fitment of an underrun	10. Rear under run must be securely attached to the rear of the vehicle.
	Exempt if the operation of equipment is compromised by the fitment of an underrun	11. Rear under-run mountings must clearly be of adequate strength to perform their function.
	OR the upper edge of the loading platform is lower than 550mm	12. In the case of a movable rear under-run, the device must be able to be securely locked into the service position.
Skip loaders, including hook lifts	Where the rear face of the body (between the support legs) is: a) essentially enclosed across the full width of the vehicle,	13. In the case of a movable rear under-run, the locking mechanism must be clearly of adequate strength to enable the device to perform its function.
	b) the lower edge of the body incorporates a channel/box section	Where platform lifts are incorporated into the under-run
	across its full width secured at each end and,	14. The lateral distance between working elements of the lift and fixed elements of rear under-run must be a maximum of 25mm.
	c) the lower edge is not more than 550 mm above the ground.	15. Each individual section of the rear under-run-must have a rear facing surface area of at least 350cm2.
Off road vehicles	Exempt	lability surface area of at least 5500mz.
Rear loading refuse collection vehicles	Where the equipment and bodywork prevent the fitting of a RUP device.	
Breakdown Vehicle (Rear loading slide and tilt bed)	Exempt when fitted with a Spectacle Lift	
Highways Surface/Geological survey vehicles	Exempt where fitment of devices would interfere with the operation equipment	

Method of Inspection		Required Standard
Vehicle type	Exemption Provided	•
Access Lift Vehicles	Only where the platform is situated behind the vehicle making the fitment of the rear under-run device impractical	
STGO Exemptions:		
Road Recovery Vehicles,	Exempt where fitment of devices would interfere with the operation equipment	
Vehicles (including STGO) for which rear under-run protection is incompatible with their use are exempt	Evidence may be required	
Rigid car transporter vehicles	Where the vehicle is permanently fitted with a trailer which facilitates loading of the vehicle and is only detachable for maintenance.	
In cases where it is impracticable to comply with the full requirements the protection device will be mounted as close to the ear as possible and must be capable of fulfilling its function. *Vehicles designed to interchange equipment for gritting, gully sucking and tipping etc. used by local authorities need only comply with *above. All other vehicles with demountable bodies must meet the requirements applicable to their category.		
Note 1: Evidence may be for a vehicle, a separate device or that the rear of the vehicle is so designed as to perform the same function. Where the rear body is so designed the Installation Inspection as appropriate relates to the structure forming the rear of the vehicle. Pre April 2009 vehicles only require the installation check.		

Method of Inspection	Required Standard
Note 2: The width of the rear axle is measured at the outermost points of the wheels including the tyres (excluding any tyre bulging close to the ground). Where more than one rear axle is fitted the width used is that of the widest axle.	
Note 3: Where the rear under-run is combined with a tail lift the lift structure may extend beyond the width of the rear axle to the width of the body, the requirements for the rear under run will be considered to be met providing the "device" meets all other dimensions up to the width of the rear axle.	
Note 4: Where the rear under-run device is contained in or comprises the vehicle bodywork, which itself extends beyond the width of the rear axle, RS5 shall not apply.	
Note 5: Items above 2m from the ground, shall not be taken into account when determining the RUPD distance from the rear of the vehicle.	

Revision	Date	Description of Change
1	24/04/2009	
2	31/01/2011	Add exemptions
3	30/04/2012	Add more exemptions to Mol

05 Steering Effort

IVA N2 / N3 Inspection Manual

Application: All Vehicles

Method of Inspection	Required Standard
Ensure the vehicle as presented has satisfactory evidence of compliance to the required standard.	 The vehicle as presented must be accompanied by satisfactory evidence of compliance with the required standard for Steering Effort (see Notes 1, 2 & 3).
Where modifications have taken place a lock to lock check must be carried out to check the system.	 The steering system must operate smoothly from lock to lock and without undue stiffness. (see Note 3).
The requirements according to the category of the base or incomplete vehicle based on maximum mass may apply.	
Note 1: A Mobile crane may be fitted with a crab steering system and if fitted it would not need approval.	
Note 2: STGO – Wide and Super-size CAT 2 and CAT 3 vehicles would not need approval and needs only to comply with RS 2.	
Note 3: For vehicles requiring an age related IVA inspection only RS 2 applies.	

Revision	Date	Description of Change
1	24/04/2009	
2	31/01/2011	Add Note 2 in reference to IVA on vehicles up to 25 years old
3	29/10/2014	New Note 2 added (STGO), old Note 2 now Note 3

06 Door Latches and Hinges

Application: All Vehicles

Method of Inspection	Required Standard
All vehicles must provide safe access to and from the drivers and passengers cabin.	You must be able to open all driver and passenger doors.
Compliance may be demonstrated by: • A vehicle approval or test report that relates to the	All driver and passenger interior door handles/controls must be easily accessible from the adjacent seating positions.
vehicle in its finished condition, the vehicle must not display modifications that would affect the validity of the	3. All doors must be capable of being secured in the closed position.
evidence. or	4. The hinges of hinge-mounted doors (with the exception of folding
An inspection of the vehicle. In the case of a Mobile crane exemption from one or more of the provisions is permissible where it can be demonstrated to the satisfaction of the Approval Authority that the special	doors), when fitted to the sides of the vehicles, must be fixed at the front edge of the doors in the direction of forward travel. In the case of double doors, these requirements apply to the door wing which opens first; it must be possible to secure the other wing of the door.
purpose of the vehicle makes it impossible to fully comply.	N2 vehicles with a maximum mass not exceeding 7,5 tonnes
Note 1: The dimension is increased to 700mm for an "off road" and STGO vehicles.	5. if the floor entrance to the passenger compartment of such vehicles is
Note 2: The dimension is increased to 100mm for an "off road" and STGO vehicles.	more than 600 mm above the ground, the vehicle must have one or more running boards or steps (see Note 1)
Note 3: This variance does not apply between the cabin floor and the step immediately below it.	6. The running boards or steps must be constructed in such a way as to preclude the risk of slipping.
Note 4: This is reduced to 200mm for an "off road" and STGO vehicles.	N2 vehicles with a maximum mass exceeding 7,5 tonnes and all N3 vehicles: RS 7-28 applies
Note 5: The outer edges of all steps must either be vertically in	
line, or the upper step(s) may be offset closer towards the vehicle than the lower step(s).	Driver/passenger cabin access step measurements (refer to Figure 1);
	The first step must be not more than 600mm from the ground (A) (see Note 1).

Door Latches and Hinges 06

Revision: 6 Date: 01/09/2015 1 of 6

Method of Inspection	Required Standard
Note 6: In the case of "off road" vehicles or. if this is necessary for reasons relating to construction & use or STGO.	The vertical distance (B) between upper surfaces of the steps must not be more than 400mm apart.
Note 7. The steering wheel may be considered as a handhold	9. The step height (S) must be a minimum of 120mm.
Note 7: The steering wheel may be considered as a handhold and as such does not need to meet any dimensional requirements.	10. The vertical distance (B) between any two subsequent steps must not vary by more than 50mm (see Notes 2 & 3).
Note 8: For "off-road" and STGO vehicles, the dimension may be increased to 1950 mm. If the floor of the driver's	11. The depth of the step upper surface must be a minimum of 80mm (D).
compartment has a height from the ground greater than "N," the handrail or handhold or equivalent holding device must terminate at the floor of the cab.	12. The step must permit a user's foot to safely use the step and must have a minimum of 150mm free space (including step upper surface depth) (E).
	13. The width of the upper surface of a step (except for the lowest step) must be a minimum of 300mm. (F) (see Note 4).
	14. The width of the upper surface of the lowest step must be a minimum of 200mm (G).
	15. There must not be any transversal offset between steps (H) (see Note5).
	16. There must be a minimum of 200mm longitudinal overlap between two subsequent steps in the same flight, or between the uppermost step and the cabin floor (J).
	In addition, the following minimum geometrical specifications for the steps must be met:
	17. The lowest step may be designated as a rung and in this instance, the rung depth (R) must be a minimum of 20mm (see Note 6).
	18. Rungs must not be of a round cross section.

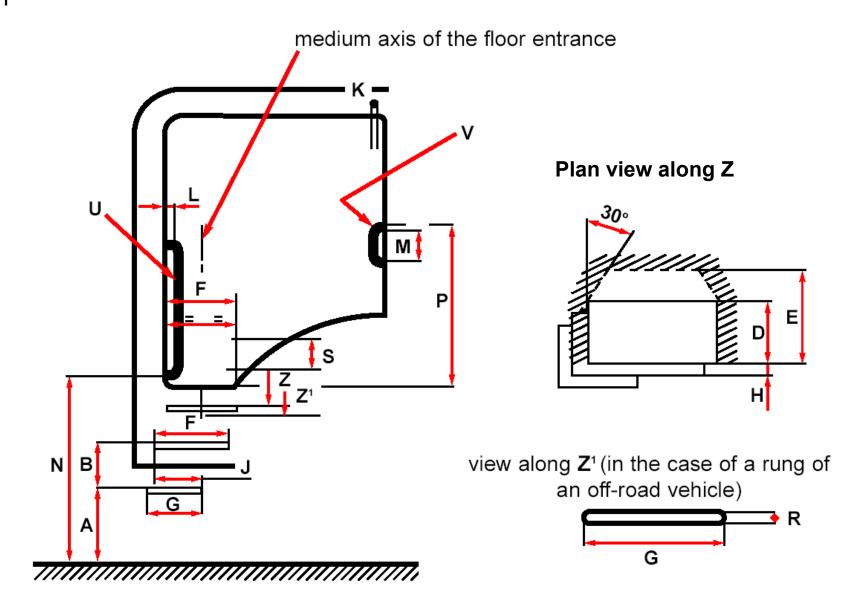

Door Latches and Hinges 06

Method of Inspection	Required Standard
	19. While descending from the driver's / passenger compartment the position of the uppermost step must be easily found.
	20. The upper surface of the steps must be non-slip. In addition, steps exposed to the weather and the dirt during driving shall have adequate run-off (draining surface).
	Access to handholds to the driver's compartment (see Note 7 and Figure 1)
	21. One or more suitable handrails, handholds or other equivalent holding devices must be provided for any access normally used to access the driver's / passenger compartment.
	22. The handrail(s) or handholds or equivalent holding devices must be positioned in such a way that they can be easily grasped and do not obstruct access.
	23. Handrails, handholds, or equivalent holding devices must not have more than 100mm discontinuity, to allow for items such as intermediate supports/fixings.
	24. In the case of access with more than two steps the handrails, handholds or equivalent holding devices must be located so that a person may support themselves at the same time at three points (with two hands and one foot or with two feet and one hand).
	25. Except in the case of a stairway, the design and positioning of the handrails, handholds and equivalent holding devices must be such that operators are encouraged to descend facing the cab.
	26. The height (N) of the lower edge of at least one handrail or handhold or equivalent holding device, measured from the ground with the vehicle in running order, shall not be more than 1850 mm (see Note 8).

Door Latches and Hinges 06

Method of Inspection	Required Standard
Method of Inspection	Required Standard 27. The minimum distance of the upper edge of the handrail(s), handholds, or equivalent holding devices from the floor of the driver's compartment (P) must be: a. handrail(s) or handholds or equivalent holding devices (U) 650 mm, b. handrail(s) or handholds or equivalent holding devices (V) 550 mm. 28. The following geometrical specifications must be met: a. gripping diameter (K): 16 mm minimum 38 mm maximum, b. length (M): 150 mm minimum, c. clearance to vehicle components (L): 40 mm minimum with open door.

07 Audible Warning

Application: All Vehicles

Method of Inspection	Required Standard
Ensure that the vehicle is fitted with a horn which when operated emits a continuous uniform sound that is capable of giving audible warning of the approach or position of the vehicle to which it is fitted.	 The vehicle must be fitted with a horn (see Note 1). The horn must be securely attached to the vehicle.
Additional panic alarm devices are permitted.	When operated the horn must emit a continuous uniform sound
Note 1: For the purposes of this item "horn" means an audible warning	(see Note 2).
device not being a bell, gong, or siren.	4. The horn as installed, must give an equivalent level of warning to other road users as that of an equivalent N2/N3 EC Type
Note 2: In the case of an Armoured vehicle: Exemption from RS 3 & 4 are permissible where it can be demonstrated to the satisfaction of the Approval Authority that the special purpose of the vehicle makes it impossible to fully comply.	Approved vehicle (see Note 2).

08 Indirect Vision

Application: All Vehicles					
Method of Inspection	Required Standard				
The vehicle must be fitted with appropriate indirect vision devices that enable the driver an adequate view to the rear.	Installation check for mirrors only				
Alternatively, vehicles manufactured after 1 st April 2016 may be equipped with a camera monitor system (CMS) that has full	 The vehicle must have all the obligatory mirrors fitted (see Table 1 & Note 1). 				
approval to UNECE Regulation 46.04. These systems generally	2. All mirrors must be securely attached to the vehicle (see Note 2).				
replace the Class II and Class IV mirrors. Compliance can be demonstrated by component approval or the	3. All obligatory mirrors must bear an acceptable European approval mark ('E' or 'e').				
presence of approval marks (for unmodified vehicle cabs).	4. All obligatory mirrors must bear the appropriate class type (see Table 1 and Note 1).				
In the case of an Armoured vehicle , exemption from one or more of the provisions is permitted where it can be demonstrated to the	5. All mirrors must be adjustable.				
satisfaction of the Approval Authority that the special purpose of the vehicle makes it impossible to fully comply.	 All obligatory mirrors must meet the field of view requirements (see Note 3 and Figure 1 or 2). 				
Note 1: For Age Related IVA please refer to the obligatory mirrors shown in Table 2 .	7. If a class V or VI mirror is mounted then regardless of their position after adjustment, no part of these mirrors or their holders must be less than 2m from the ground when the vehicle is unladen. (see Note 4).				
Note 2: Mirror security should be such that wind deflection when the vehicle is driven at normal road speeds will not cause the field of view to change. It should also be mounted so that the mirror cannot vibrate and cause the driver to misinterpret the image.	8. Where the lower edge of an exterior mirror is less than 2m above the ground this mirror must not project more than 250mm beyond the overall width of the vehicle measured without mirrors.				
Note 3: Where a valid approval or test report is available which	Camera Monitor Systems				
covers the vehicle in its finished state, a field of view check is not required.	9. Camera Monitor System installations must be accompanied by acceptable evidence of approval to UNECE Regulation 46.04				
Note 4: For N2≤ 7500kg vehicles – compulsory only if a Class V mirror can be fitted.					

Indirect Vision 08

Note 5: These mirrors are not required to be mounted on vehicles where the cab height is such as to prevent compliance with the 2 metre height requirement and are only required on "Forward control vehicles" (See Glossary of Terms).

Table 1

Class of Mirror		Obligatory Fitment to Vehicle
Side Exterior	(Class II)	Offside and nearside
Wide Angle	(Class IV)	Offside and nearside (see Note 4)
Side Close proximity	(Class V)	Nearside (offside if LHD) (see Note 5)
Front	(Class VI)	Front (7501kgs or more) (see Note 5)

09 Braking

Application: All Vehicles

Method of Inspection	Required Standard
Ensure that the vehicle as presented has satisfactory evidence of compliance to the required standard.	 The vehicle as presented must be accompanied by satisfactory evidence of compliance with the required standard for "Braking." (see Notes 1 & 2)
In the case of a Mobile crane with more than 4 axles derogations are permitted provided that: (a) they are justified by the particular construction; and	
(b) all the braking performances relating to parking, service and secondary braking are fulfilled. Documentary evidence is required from the approval authority.	
Note 1: Vehicles subject to both P&T and STGO (dual use) will require evidence of compliance for P&T weights, and evidence of compliance for the higher weights of STGO. The latter should comprise calculations, (verified by a technical service) test track work is not requested.	
Note 2: Vehicles solely for STGO use will be required to provide evidence of compliance to the requirements via documentary evidence. This should comprise calculations, (verified by a technical service) test track work is not requested.

10 Electromagnetic Compatibility

Application: All Vehicles

Method of Inspection	Required Standard
Ensure the vehicle has satisfactory evidence of compliance to the required standard and has not been modified such to invalidate the approval.	 The vehicle as presented must be accompanied by satisfactory evidence of compliance with the required standard for "EMC." (see Note 1).
Note 1: STGO – Abnormal Indivisible Load Vehicles (GTW of at least 120,000kg) where due to its special build No base vehicle approval is available, will only require a declaration from the manufacturer for the equipment fitted. Note 2: This only applies to equipment that is likely to be used when the vehicle is being driven.	Where any additional equipment has been installed, a declaration supplied by the Manufacturer / applicant, confirming compliance of the additional items must be presented (see Note 2).

13 Anti - Theft / Immobiliser / Alarm

Application: All Vehicles (Optional Fitment)

Method of Inspection	Required Standard
If the vehicle is fitted with a mechanical anti-theft device, an electronic immobiliser, or an alarm system (including panic alarm) The system or systems must comply with this section. Note 1: A "Category 1" installation refers to an immobiliser and an alarm. "Category 2" installation refers to an immobiliser only. Ensure that the vehicle is accompanied by documentary evidence of compliance for a category 1 or 2 installation as appropriate. Evidence of compliance must be one of the following:	 1. Where an anti-theft device incorporates a mechanical part that acts upon a system used to control the vehicle; a. It must deactivate before the engine can be started b. It must be deactivated while the engine is running c. It must have an actuation which is a distinct and separate function from that of stopping the engine d. It must not operate on any part of the braking system
 Documentary evidence from a test laboratory Documentary evidence from the chassis manufacturer An original certificate of installation from a Mobile Electronics and Security Federation (MESF) accredited installer Note 2: An optional panic alarm not forming part of an alarm system is not required to meet RS4. 	 If fitted to the Vehicle, an Immobiliser must be accompanied by evidence of compliance (see Note 1). If fitted to the Vehicle, an Alarm must be accompanied by evidence of compliance (see Note 1). If fitted to the Vehicle, a Panic Alarm must be accompanied by evidence of compliance (see Notes 1 & 2).

15 Seat Strength

Application: All Vehicles

Application. All vehicles	
Method of Inspection	Required Standard
The requirements of this section can be deemed to be met where the vehicle is presented with evidence of :- • An approval to the requirements of Directive 74/408 as last amended by 2005/39/EC or the requirements of UNECE Regulation 17.06 or 80.01 or • a test report to the technical provisions of the Directives/Regulations quoted above and • subject to a random check that the documentation matches the vehicle presented, including seat type Note 1: This inspection does not apply to any seating intended solely	 All seats must be adequate in strength and securely mounted to a load bearing part of the structure or have adequate support to spread the load of the seat mounting if attached to a non-metallic floor pan separate from the chassis (see Notes 1, 2, & 3). Where seats incorporate seat belt anchorages the seat must be approved to at least the category of vehicle to which they are fitted. All seat mountings must be of adequate strength to support the loads likely to be imposed (see Notes 1 & 3). Each moveable seat, seat back adjustment and seat displacement system must incorporate an automatic locking system which
for use while the vehicle is stationary, and any such seats must be clearly identified to users by means of a pictogram or a sign with appropriate text. Note 2: In respect of a seat that comprises of a "lift-out" backrest and/or squab it will be considered secure providing, when in the	 operates in all positions provided for normal use (see Notes 1 & 4). 5. All seats which can be tipped forward or have fold-down backs must lock automatically in the normal position and if seats for adults are fitted behind, then the unlocking control must be easily accessible from that position (see Notes 1 & 4).
operational position, it is located such that there is no possibility of accidental lateral or longitudinal movement within the vehicle.	Where seats are intended for use only when the vehicle is not being driven on public roads, the seats must be accompanied by a
Note 3: On a seat to which a seat belt is mounted (integral seat belt) consideration must be given to the seat mounting as they are now considered to be seat belt anchorages. The Standards, and guidance on the types of construction acceptable for this type of seat are found in section 19 (Seat Belt Anchorages).	pictogram or sign clearly indicating that the seat is not to be used whilst the vehicle is in motion.
Note 4: A seat/seat back INERTIA locking device is acceptable, i.e., a device that operates during the deceleration of the vehicle.

17 Speedometer and Reverse Gear

Application: All Vehicles having a maximum speed exceeding 25mph

Method of Inspection	Required Standard
A vehicle must indicate an accurate speed to the driver at all times and the vehicle must be capable of travelling in a rearward direction under its own power.	 The vehicle must be fitted with a Speedometer capable of accurately indicating the speed of the vehicle (see Notes 1, 2 & 3).
A Speedometer may be digital or a dial instrument.	The speedometer must be capable of being read at all times of the day or night.
Note 1: Vehicles using age related IVA manufactured before May 2006 can use an analogue tachograph to fulfil this function.	 Imperial (mph) and metric (km/h) units must be permanently marked on the face of a dial instrument (see Notes 2 & 4).
Note 2; STGO - Abnormal Indivisible Load Vehicles (GTW of at least 120,000kg) only requires the speedometer to be marked in mph. Note 3: Where the accuracy of the device is in question, it will be	 The "rest" position for the needle of a dial type must lie either on or below the first marked increment (see Note 5).
necessary for the applicant to provide compliance.	5. A speedometer must be capable of indicating the vehicle speed in
Note 4: Imperial (mph) markings are not required on a tachograph dial face.	miles per hour (mph) and kilometres per hour (km/h) at uniform intervals not exceeding 20mph for all speeds up to the maximum design speed of the vehicle. (see Note 6).
Note 5: The first marked increment may be at 0 mph but must not exceed 20 mph.	Reverse gear
Note 6 : Vehicle maximum design speed (without the use of a speed limiting device) shall be in the form of vehicle specific documentary evidence from the vehicle manufacturer.	 The vehicle must have a reverse gear, which can be selected from the driving position and operates (see Note 7).
Note 7: "Reverse Gear" is a device used to propel the vehicle in a rearwards direction under its own power. This does not have to be in the gearbox, it may be a separate component i.e., electric motor.

the listed information.

18 Statutory Plates

Application: All Vehicles

Method of Inspection	Required Standard
All vehicles must be provided with a manufacturer's plate.	Manufacturers VIN Plate
Legislation places no restriction on the material from which the plate is made. The purpose of the plate is to impart information rather than to act as a proof of identity.	The vehicle must be fitted with a manufacturer's plate, in a conspicuous and readily accessible position.
Check that the manufacturer's plate (in the case of a multistage build, one for each stage) complies with the	 A manufacturer's plate must be fitted for each stage of a multistage build. (see Note 1)
Required Standards. It would be helpful if separate plates are fitted in close proximity to each other, but this is not mandatory	3. The manufacturer's plate(s) must be made of a durable material.
for vehicles covered by this manual.	4. All plate(s) must be indelibly marked with the Vehicle Identification Number (VIN) which matches the number marked into the vehicle structure (see Note
Visually check that the characters used for the Manufacturers Plate and Vehicle Identification Number (VIN) complies to the	2).
required standards.	The manufacturer's plate(s) must be securely attached to a part of the vehicle that will not be replaced through normal use (see Note 3).
Where the vehicle is subject to a multistage build, a plate is required on completion of each stage as appropriate, every plate fitted must display the same VIN as displayed on the chassis, the weight information is only necessary on the	 The manufacturer's plate(s) must show the required information, in the correct order inside a clearly marked rectangle. (see Annex 1).
chassis manufacturer's plate or on a converters plate if they have altered those weights with any modification.	The Vehicle Identification number on the manufacturer's plate must be marked in characters at least 4mm high.
The manufacturer may give additional information. The approval number and build stage number may be listed below the manufacturers name and the number of axles may be listed underneath the VIN number. Any other information must be outside a clearly marked rectangle which shall enclose only	8. The characters on the manufacturer's plate (with the exception of the Vehicle Identification Number) must be at least 2mm high.

Statutory Plates 18

Method of Inspection

The identification number of the base vehicle (VIN) prescribed by Directive 76/114/EEC shall be retained during all the subsequent stages of the type-approval process to ensure the 'traceability' of the process.

However, at the final stage of completion, the manufacturer concerned by this stage may replace, in agreement with the approval authority, the first and second sections of the vehicle identification number with their own vehicle manufacturer code and the vehicle identification code if, and only if, the vehicle has to be registered under his own trade name. In such a case, the complete vehicle identification number of the base vehicle must not be deleted.

All vehicles must have a vehicle identification number marked onto the chassis by hammering, stamping or similar so that the vehicle can be clearly identified.

Note 1: A separate manufacturer's build plate will not be required for a vehicle subject to an age related IVA inspection unless a structural/chassis modification has been carried out since the original build e.g., the installation of an additional axle.

Note 2: For markings to be considered 'indelible' they should be unlikely to become disfigured or obliterated during the life of the trailer. Whilst stamping or engraving is preferable it is possible to accept a printed or painted plate providing it has been treated in such a way that it is most unlikely that essential information would be obliterated or defaced during the normal life of the vehicle.

Note 3:- 'Securely attached' means screwed, bolted, riveted, or otherwise fixed such that it is not likely to become displaced during the life of the vehicle.

Required Standard

Permanent VIN Number

- **9.** The VIN must be marked on the chassis, frame, or other similar structure on the right hand side of the vehicle (viewed from the rear).
- **10.** The VIN must be placed in a clearly visible and accessible position by a method such as hammering or stamping so that it cannot be obliterated or deteriorate.
- **11.** The VIN number must consist of 17 digits with the information shown in a single line (see **Notes 4 & 5**).
- **12.** Capital letters and numerals must be used for the VIN.
- **13.** There must not be any gaps between the characters for the VIN or unique vehicle identifier number shown on the manufacturer's plate or stamped into the vehicle (see **Note 5**).
- **14.** The characters used for the VIN number stamped into the chassis, frame or other similar structure must be at least 7mm high.
- **15.** Use of the letter I, the letter O, the letter Q, dashes, asterisks, and other special signs are not permitted.

Where the VIN has been changed in agreement with the Approval Authority

- **16.** Evidence of the agreement with the approval authority must be provided.
- **17.** The original complete vehicle identification number of the base vehicle must be present on the chassis.
- **18.** The complete new VIN must be stamped on the chassis as near as possible to the original VIN.

Statutory Plates 18

Method of Inspection

Note 4: As an exception for technical reasons, it may also be marked on two lines. However, in this case no section may be divided between the two lines. The beginning and end of each line must be indicated by a symbol which is neither an Arabic numeral nor a roman capital letter, and which cannot be confused with either. (First section would be 3 characters in length, second section would be 6 characters in length and the last section would be 8 characters in length).

Note 5: The spacing of characters must be such that no additional characters could be added at a later date.

Note 6: There is no specific format for the special type's plate. The diagram shown opposite is purely an example. It is important to ensure the presence of all relevant information.

Note 7: There is no requirement for a plate on a vehicle defined as engineering plant. A plate (as opposed to a sign) is only required for Category 2 or 3 Abnormal Indivisible Load Vehicles, mobile cranes, and road recovery vehicles.

Required Standard

19. The last eight characters of the new V.I.N. must be identical to the last eight characters of the base vehicle V.I.N.

Special Types Plate (see Notes 6 & 7)

- **20.** The vehicle must be fitted with a "Special Types" plate that is securely fixed to the vehicle in a conspicuous and readily accessible position.
- **21.** It must contain the heading "SPECIAL TYPES USE" in letters not less than 4mm high.
- 22. It must be indelibly marked, in letters and figures not less than 4mm high, with the maximum weights (in kg or tonnes) at which, in the opinion of the manufacturer, the vehicle may be used legally in the UK when travelling on roads at or below the speed in question, as per the table below, (with the speeds and number of axles as applicable):

SPECIAL TYPES USE

	Axle 1	Axle 2	Axle 3	Axle 4	Max gross weight	Max train weight
20 mph						
25 mph						
30 mph						
35 mph						
40 mph						
	•	•		•	•	•

Name of Manufacturer

Approval number and/or Build Stage number (If applicable)

Vehicle Identification Number (VIN)

Maximum permitted laden mass of vehicle Maximum permitted laden mass for the combination where the vehicle is used for towing (see **Note 5** below)

Maximum permitted laden road mass for each axle, listed in order from front to rear

Note 1: Where the vehicle is subject to a multistage build, a plate is required on completion of each stage as appropriate, every plate fitted must display the same VIN as displayed on the chassis, the weight information is only necessary on the chassis manufacturer's plate or on a converters plate if they have altered those weights with any modification.

Note 2: For markings to be considered 'indelible' they should be unlikely to become disfigured or obliterated during the life of the vehicle. Whilst stamping or engraving is preferable it is possible to accept a printed or painted plate providing it has been treated in such a way that it is most unlikely that essential information would be obliterated or defaced during the normal life of the vehicle.

Note 3: The spacing of characters must be such that no additional characters could be added at a later date.

Note 4: If any of the technically permissible masses are higher than the masses permitted in GB and NI for a vehicle or axle (see Annex 1 for details of the maximum masses permitted in GB and NI), then there should be 2 columns for masses - in the left hand column the maximum permitted mass in GB/NI, and in the right hand column, the technically permissible mass.

This does not apply to a vehicle issued with a Plating certificate under the Goods Vehicles (Plating and Testing) Regulations 1988 where only one column, giving the technically permissible masses, is permitted. (See Section 48 Masses and Dimensions for requirements for a plating certificate).

Note 5: Only required to be displayed on applicable vehicles, i.e., designed to allow towing.

Record of Revision

Revision	Date	Description of Change
6	29/10/2012	Insert new Note 1 and renumber following Notes.
7	03/02/2014	Insert marked rectangle in RS6 and remove manufacturer from RS10
8	29/10/2014	DVSA replaces VOSA, new RS19, 20 & 21 relating to Special Types Plate
9	23/01/2015	Add note 8 relating to special types plate format and amendments to Annex 1
10	01/092015	Addition of Note 9
11	10/04/2018	Rewrite Section, remove weights table
12	01/09/2020	Clarify STGO plate and multi stage plate requirements, add Note 7.

IVA N2 / N3 Inspection Manual Document uncontrolled when printed

This page intentionally left blank

19 Seat Belt Anchorages

Application: All Vehicles (required to be fitted with seatbelts- see Section 31)

Method of Inspection

Application limited to seats designated for normal use when the vehicle is travelling on the road. Seats which are not designated for use when the vehicle is travelling on the road shall be clearly identified to users either by means of a pictogram or a sign with an appropriate text. See section 31, RS 03.

Ensure each seating position is fitted with the required number of anchorage points. Assess the anchorage positioning, their strength, and that of the surrounding vehicle structure.

Note 1: Where the vehicle has two driving positions both must meet the minimum anchorage requirements and the second seat satisfies the requirement for the "foremost outboard "passenger seat".

Note 2: The front centre seat will require 3 anchorages and a 3 point belt where the windscreen is located;

- a) in the case of a fixed (non-sliding) seat, within 840mm. of the seat reference point, or;
- b) in the case of a sliding seat, within 840mm. of the seat reference point when the seat is 127mm forward of its rearmost position (see Annex 3).

Note 3: Seats require a minimum of 2 point anchorage if they are exposed, i.e., if there is no screen in front of a seat. The screen being no more than 1.3m in front of the H point wide enough to be at least 200mm either side of the H point and high enough to reach 400mm above the H point. The surface area of the screen must be at least 800cm2. A screen or seat forming a screen must meet the following conditions:

Required Standard

- 1. The drivers seating position must have a minimum of 2 anchorages (see **Note 1**).
- **2.** The foremost outboard passenger seating position must have a minimum of 2 anchorages.
- **3.** A front centre seating position must have a minimum of:
 - a. 2 anchorages or
 - **b.** 3 anchorages (see **Note 2**)
- **4.** Rear seating positions must have a minimum of 2 anchorages if required to be fitted with seat belts. (see **Note 3** and Annex 1 in Section 31).
- **5.** The seat belt anchorage must be correctly located so to ensure the belt will sit correctly on the wearer.
- **6.** The anchorage and surrounding structure must be of adequate strength to withstand the load likely to be imposed by the torso in the event of a vehicle frontal impact (Annex 1).
- 7. Those seats which are not intended for use when the vehicle is driven on a public road must be accompanied with a pictogram or sign clearly indicating that the seat is not to be used whilst the vehicle is in motion (see **Note 4**).

Method of Inspection	Required Standard
a) The surface must be of suitable strength and showing no	
discontinuities such that, if a sphere of 165 mm diameter is geometrically	
projected in a longitudinal horizontal direction through any point of the space defined above and through the centre of the sphere, nowhere in	
the protective screen is there any aperture through which the geometrical	
projection of the sphere could be passed.	
b) A seat is considered to be an 'exposed seating position' if the	
protective screens within the space defined above have a combined surface area of less than 800 cm ² .	
Surface area of less than ooo citi.	
Note 4: This applies to vehicle types such as mobile banks, incident	
support units or similar where seating is provided in the rear 'load	
carrying' space and intended for use only when the vehicle is stationary.	

Annex 1

Strength of seat belt anchorages.

Seat belt anchorages must comply with the strength requirements for N2 / N3 vehicles in Directive 76/115/EEC This can be demonstrated in one of the following ways:

- 1. Evidence of type approval
- 2. Documentary evidence of testing to the Directive standard
- 3. Comparison with a type approved vehicle
- 4. Visual assessment

1. Evidence of type approval

Suitable evidence of type approval will be accepted. If the seat has integral anchorage points this must cover the specific seat make and type and it's mounting to structure.

2. Documentary evidence of testing to the Directive standard.

Suitable documentary proof will be accepted. If the seat has integral anchorage points this must cover the specific seat make and type and it's mounting to structure.

3. Comparison with a type approved vehicle

Evidence that the vehicle is of identical structure to a vehicle which has been demonstrated to comply with the requirements or which is type approved may be used to confirm compliance. If the seat has integral anchorage points the compassion must have the same seat type and floor mounting structure.

3 of 12

4. Visual Assessment

In the absence of documentary evidence, the vehicle may comply with the visual inspection requirements in Annex 2.

Annex 2

Seat Belt Anchorages Strength Assessment general.

In a severe accident, the seated occupant can exert huge loads upon their seatbelts (in the region of 1.5 tonnes for a 75kg person). Seatbelt anchorages together must withstand these large loads from the seatbelts. These loads in turn must be dissipated by the vehicle structure.

In assessing the strength of the anchorages, it is essential to consider

- the vehicle structure in the immediate vicinity of the anchorage, and
- the parts of the vehicle structure into which the loads from the anchorages will be dissipated.

Sliding Seats

Some seats are fitted to a system of "runners" so as to allow fore and aft adjustment or to provide two alternative positions of use. Some of the belt anchorages for such seating positions may be attached to the seat. Before making any assessment of the belt anchorages, documentary evidence should be sought to confirm that the seat and runner assembly is capable of satisfying the requirements of the Directive when tested **independently** of the vehicle. Once this has been confirmed, the installation of the seat in the vehicle can be assessed.

On seats where some of the anchorages are in the seat structure and some in the vehicle structure, the relevant requirements for each anchorage point will apply, i.e., for the anchorage in the structure the relevant parts of section (1) apply, and for the seat the relevant parts of section (2) must also be met.

(1) Where seat belt anchorages are contained in the vehicle structure.

- Anchorages in thin and/or flat panels should have reinforcing structure at least 75 x 75 x 4mm thick welded to the panel.
- There should be an adequate load path to the vehicles/cabs main structural members.
- Welding should appear neat and of good quality; and should not show signs of gaps or visible lack of penetration. (Whilst it is impossible to judge the quality of a weld just by looking at it, messy welding is rarely strong welding).
- Bolts used in structural areas should be of grade 8.8 or better. (Such bolts will be marked 8.8 or 12.9 on the hexagonal head), however, cap-head bolts or 7/16" (11mm) UNF seat belt anchorage bolts (with an anodised finish) not marked in this way will be considered to be of equivalent strength. Bolts should be M8 or larger.
- Where threaded bushes are fitted to tube section structure they should be welded (at both ends) through the tube, and not end mounted on the surface. (A threaded bush may be attached by its side surface to a structural component).

(2) Where seat belt anchorages are contained within the seat.

Seat criteria

• An approval or test certificate from a recognised test authority must be provided to show that the seat itself is capable of meeting the strength and anchorage positional requirements of Directive 76/115/EC as amended. It should typically include at least the following information:

Seat make and model,

Vehicle category (N2 or N3) (or alternatively M1, M2 can be accepted in place of N2 and M1,M2orM3 can be accepted in place of N3), Seat type (single/double or triple),

Belts fitted (3-point or lap), Pedestal height,

Mounting details (i.e., on tracking or rigidly, mounted to a base plate).

Seat mounting criteria

Fixed Single Seats or rows of single seats mounted directly to the steel plate floor

- Load spreading plates at least 75 x 75 x 4mm thick must be fitted between the front legs of the seat and the **inside** of the vehicle floor (See figure 1).
- Load spreading plates at least 75 x 75 x 4mm thick must be fitted between the rear leg securing nuts and the **underside** of the vehicle floor (See figure 1).
- In some cases, the mounting bolts will pass through slotted holes in the load spreading plate to allow for adjustment. Suitable arrangements must be in place (e.g., oversized washers) to prevent the nut or the head of the bolt from pulling through the slot in the plate.
- Where the rear mounting bolts are located within 40mm of a chassis/structural member, the plate may be folded (not reduced in size) to clear the obstruction and the fold should abut snugly against the chassis/structural member (see **Figure 1**).
- Where two or more single seats each having separate pedestals are mounted within 200mm of each other, to form a row of seats. Such seats must be fitted with reinforcing members under the vehicle floor. The reinforcement needs to consist of one longitudinal 75mm wide channel section per seat pedestal underneath the floor. The height and thickness of the channel will be a minimum of 38mm and 5mm, respectively. Load spreading plates should still be fitted between the front seat legs and the inside of the vehicle floor. In all cases, the ends of the channel sections must abut snugly against the bearers immediately in front of and behind the seat concerned.
- The channel ends must be free of sharp edges, which may tear the vehicle floor under load.
- **ALL** the mounting holes provided in each pedestal for securing the seat to the vehicle must be utilised, with the correct sized bolt for the hole, unless documentary evidence is available to show an alternative fixture.
- Seat mounting bolts that pass through hollow section reinforcing members must be fitted with "anti crush tubes".
- Single seats with integral 3-point belt anchorages, attached to the vehicle floor and a wheel arch, via offset or asymmetrical legs must have

documentary evidence from the seat manufacturer to confirm that the seat itself can withstand the forces required by the Directive when tested independently of the vehicle on its offset pedestals. The outboard leg of the seat mounted through the arch requires a bridge structure secured to the underside of the arch (The security does not require welding but could be for example the seat mounting bolts that pass through the structure). This structure should span the arch, and if flat plate should be at least 75mm wide and 4mm thick, if channel or box section is used it should be of equivalent strength to the flat plate.

Fixed double seats mounted directly to the steel plate floor

- Double seats with a minimum of two pedestals and integral belt anchorages fitted directly to the vehicle floor, should be fitted with substantial channel or box section reinforcements under the vehicle floor.
- These must run longitudinal under each of the legs and extend as far forward and rearward as the next structural cross member.
- Channel sections should be at least 76mm x 38mm x 5mm positioned with the flanges facing downwards. If box sections are used, similar exterior dimensions should be used, and the wall thickness must be at least 4mm.
- The channel ends must be free of sharp edges, which may tear the vehicle floor under load.
- In addition, reinforcing plates at least 100mm x 100mm x 4mm must be fitted between the front legs and the inside of the vehicles steel floor.
- **ALL** the mounting holes provided in each pedestal for securing the seat to the vehicle must be utilized, with the correct sized bolt for the hole, unless documentary evidence is available to show an alternative fixture.
- Seat mounting bolts that pass through hollow section reinforcing members must be fitted with "anti crush tubes". (Because these crush tubes are usually not visible in the completed vehicle the onus would be on the presenter to satisfy the Approval Officer these were fitted).
- The channel ends must be free of sharp edges, which may tear the vehicle floor under load.

Fixed triple seats mounted directly to a steel plate floor

It is not, generally, possible to secure such seats using simple reinforcements alone. If a triple seat is fitted with three-point integral anchorages, documentary evidence that the complete assembly has been successfully tested "in-vehicle" should be sought.

Removable Single and Double seats fitted in tracking mounted to a steel plate floor

There are 3 general types of tracking used:-

Low Profile tracking (this can be regarded as any tracking system with a section depth of up to 30mm) (See figure 1) or

"Heavy Duty" tracking (this can be regarded as any tracking system with an overall depth of 30mm or more) (See figure 1) or

Dedicated clamping mechanisms attached to the floor of the vehicle. (These will need documentary evidence of compliance including mounting to the vehicle)

Low Profile tracking systems fitted to a steel plate floor

- Attached to the vehicle using 8mm (grade 8.8 or better) fasteners no more than 105mm apart.
- "Self-tapping" screws and "riv-nuts" are not considered as being of equivalent strength (unless documentary evidence can be provided).
- Load spreading washers or plates should be fitted under the vehicle floor.
- If plain washers are used, these should be a minimum of 50mm diameter and 3mm thick.
- In cases where the centre of a securing bolt is within 20mm of a chassis member, the washer may be cropped to clear the cross member.
- If plates are used, these should be a minimum of 35mm wide and 3mm thick and should present a rounded edge of at least 2mm radius towards the sheet steel floor.
- Plates and washers should, wherever possible, either span adjacent corrugations or approximately follow the contours of the corrugations.
- ALL the mounting holes provided in each pedestal for securing the seat to the tracking must be utilised.
- **ALL** the mounting holes provided to secure any given length of tracking to the vehicle must be utilised.
- Tracking must be installed in a continuous length without joints.
- Tracking mounting bolts that pass through hollow section reinforcing members should be fitted with "anti crush tubes".
- In some cases, the mounting bolts will pass through slotted holes in the load spreading plate to allow for adjustment. Suitable arrangements must be in place (e.g., oversized washers) to prevent the nut or the head of the bolt from pulling through the slot in the plate.
- The channel ends must be free of sharp edges, which may tear the vehicle floor under load.

Requirements for Heavy Duty tracking systems fitted to a steel plate floor

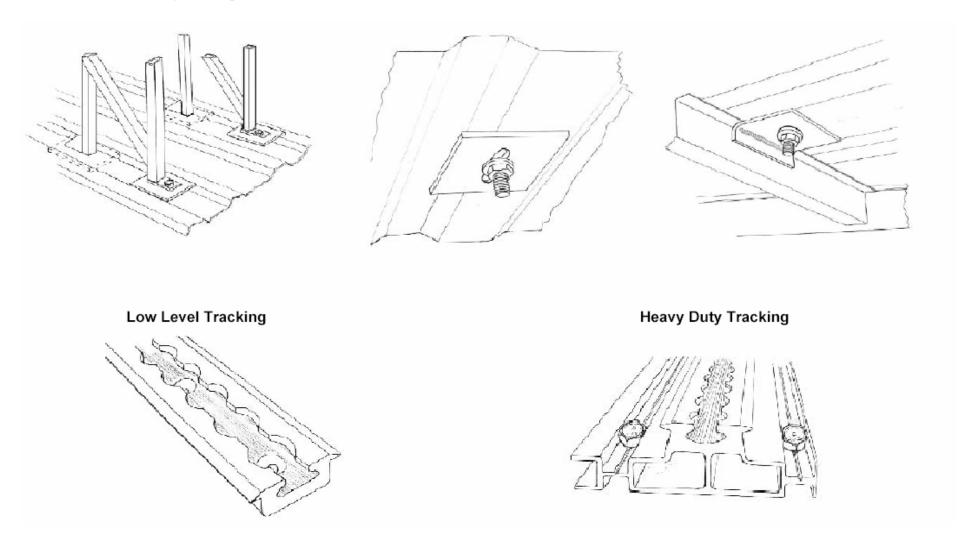

Although these differ in appearance, they all share the same principal feature – i.e., a much deeper section than the "low profile" tracking systems (30mm or more). These lengths of tracking have sufficient depth of section to resist the large bending loads applied during a seat belt anchorage test (See figure 1).

- Attached to the vehicle using 8mm (grade 8.8 or better) fasteners no more than 300mm apart.
- "Self-tapping" screws and "riv-nuts" are not considered as being of equivalent strength (unless documentary evidence can be provided).
- Load spreading washers or plates should be fitted under the vehicle floor.
- If plain washers are used, these should be a minimum of 50mm diameter and 3mm thick.
- In cases where the centre of a securing bolt is within 20mm of a chassis member, the washer may be cropped to clear the cross member.
- If plates are used, these should be a minimum of 35mm wide and 3mm thick and should present a rounded edge of at least 2mm radius towards the sheet steel floor.
- Plates and washers should wherever possible, either span adjacent corrugations or approximately follow the contours of the corrugations.

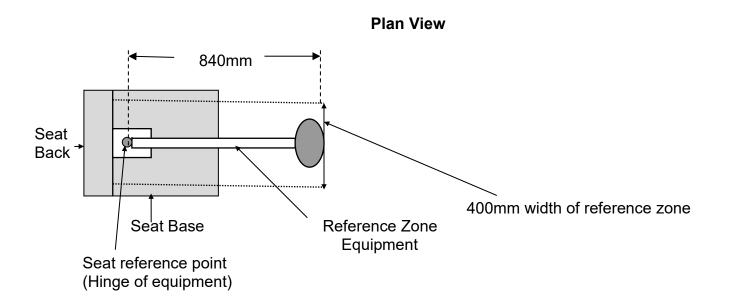

- ALL the mounting holes provided in each pedestal for securing the seat to the tracking must be utilised.
- ALL the mounting holes provided to secure any given length of tracking to the vehicle must be utilised.
- Tracking must be installed in a continuous length without joints.
- Tracking mounting bolts that pass through hollow section reinforcing members should be fitted with "anti crush tubes".
- In some cases the mounting bolts will pass through slotted holes in the load spreading plate to allow for adjustment. Suitable arrangements must be in place (e.g., oversized washers) to prevent the nut or the head of the bolt from pulling through the slot in the plate.
- The channel ends must be free of sharp edges, which may tear the vehicle floor under load.

20 Installation of Lights

Application: All Vehicles

Method of Inspection

The examiner will perform a visual check of all lamps and reflectors fitted to the vehicle for the correct colour light visible to the front or rear and that no light emitting surfaces are obscured.

Lamp/reflector **lateral position** is measured from the extreme outer edge of the vehicle (disregarding tyres, mirrors, lamps, and reflectors) to the edge of the illuminated area (or reflective surface on a reflector) nearest that side of the vehicle.

Lamp/reflector **vertical position** is measured from the ground:

- In the case of the minimum height to the lower edge of the illuminated area (reflective surface on a reflector)
- In the case of the maximum height to the top edge of the illuminated area (reflective surface on a reflector).

For the purposes of the test, lamps that are intended to illuminate the road forward of the vehicle are considered to be either:

a) main beam headlamps (including spot lamps and driving lamps)

Date: 20/10/2023

b) dipped beam headlamps, or

Revision: 8

c) front fog lamps.

Required Standard

- 1. The vehicle must be fitted with lamps or retro reflective material only capable of showing a white light to the front except for:
 - an amber light from a direction indicator
 - a yellow light from a front fog lamp
 - an amber light from a side marker light
 - emergency vehicles only, a blue light from a warning lamp or beacon.
 - an amber light from a hazard beacon / warning lamp
 - · a yellow light from a conspicuity marking material
 - a red light from a rearmost side marker or rear position lamp
- **2.** The vehicle must be fitted with lamps or retro reflective material only capable of showing a red light to the rear except for:
 - an amber light from a direction indicator
 - a white light from a work lamp, reversing lamp, interior lamp, or a registration plate lamp
 - a yellow light from a rear registration plate
 - an amber light from a side marker light
 - emergency vehicles only, a blue light from a warning lamp or beacon.
 - an amber light from a hazard beacon / warning lamp
 - a yellow light from a conspicuity marking material
- **3.** The operation of any lamp must not affect any other lamp or be affected by the operation of any other lamp, unless specifically designed to do so.
- **4.** All lamps, reflectors and rear markers must be securely fitted to the vehicle and not move by swivelling, deflecting or otherwise while the vehicle is in motion, except for:

Method of Inspection

If workshop tools or equipment are required to reinstate the function of a lamp that 'lamp' should be considered not 'fitted'. If a stop lamp meets the criteria of an optional lamp and is 'fitted', i.e., connected, it must operate.

Two or more lamps (see "A" and "B" in Figure 4, 4a), whether identical or not, having the same function and emitting light of the same colour are considered to be one lamp if the aggregate illuminated area of the lamps occupies 60% or more of the area of the smallest rectangle circumscribing those illuminated areas.

Note 1: This does not apply to rear retro reflectors which must be visible at all times.

Note 2: Fixed position of a movable component means the stable or natural rest position(s) of the movable component which can be specified by the manufacturer, whether locked or not.

Required Standard

- any lamp or reflector which by design can be deflected to the side with the movement of the front wheel or wheels of the vehicle when turned for the purpose of steering the vehicle
- a headlamp for adjustment or dipping of the beam
- a headlamp which can be retracted or concealed
- a work lamp, used to illuminate a working area or the scene of an accident, breakdown, or road works in the vicinity of the vehicle to which it is fitted.
- **5.** All obligatory and optional lamps, reflectors and rear markers must be fitted to their correct orientation.
- **6.** When every door, tailgate, boot lid, or other movable part is in the fixed open position (any movable component, with or without a light-signalling device installed on it, in any fixed position (see **Note 2**) different from the 'normal position of use') each of the:
 - front and rear position lamps
 - front and rear indicators
 - rear retro reflectors

must fulfil one of the following conditions:

- **a.** half (50%) of the apparent surface of the lamp / reflector is visible from directly in front of / behind (as appropriate) the vehicle, **or**
- **b.** additional fully visible lamp (s) / reflector (s) satisfying all requirements for the above lamps / reflectors are activated / visible, **or**
- a notice in the vehicle must inform the user that in certain positions of the movable components, other road users should be warned of the presence of the vehicle on the road (e.g., by laying out a warning triangle) (see Note 1).

Figure 1

Horizontal Angles of Visibility

Each lamp and reflector must be positioned such as to provide an "apparent surface". At least 50% of the "apparent surface" of each lamp or reflector must be visible from any point within the relevant angles.

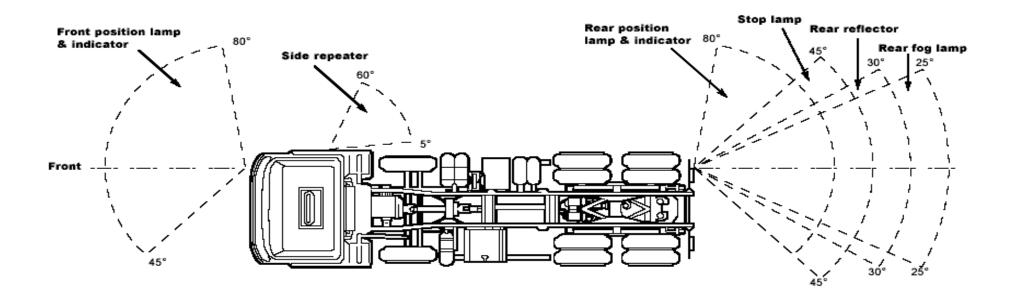

Figure 2

Vertical Angles of Visibility

Each lamp and reflector must be positioned such as to provide an "apparent surface". At least 50% of the "apparent surface" of each lamp or reflector must be visible from any point within the relevant angles.

Front Position Lamps and Indicators (including Side Repeaters)

- 'a' = less than 750mm above ground level.
- 'b' = 750mm or more above ground level.
- 'c' = Rear position lamps and Stop lamps 1500mm or more above ground level. Indicators and Rear reflectors 750mm or more above ground level.
- 'd' = Rear position lamps and Stop lamps less than 1500mm above ground level.
- 'e' = Rear position lamps, Stop lamps, Indicators and Rear reflectors less than 750mm above ground level.
- 'f' = Rear fog lamps.

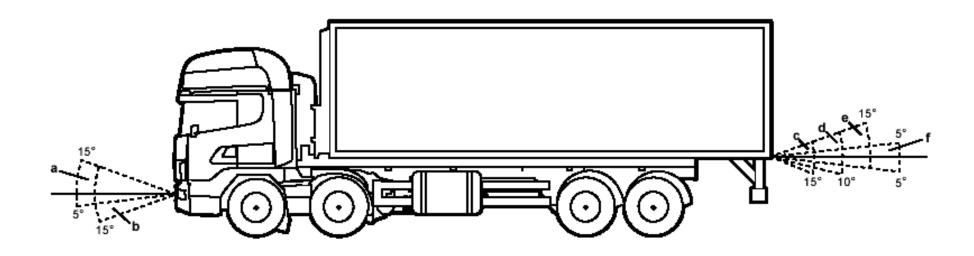

Figure 3

"To the rear" of the vehicle means:

If viewed from an observer moving within an area shown in the diagram below (Zone 1), the sides of which are at an angle of 15 degrees out from the extreme outer edge of the vehicle starting from the rear corner and extending up to **25m** from the rear of the vehicle (measured along the vehicle longitudinal), no light other than a red light (with the exception of amber light from a direction indicator, white light from a work lamp, reversing lamp, or a registration plate lamp or yellow light from a registration plate lamp) is permitted to be visible in this area.

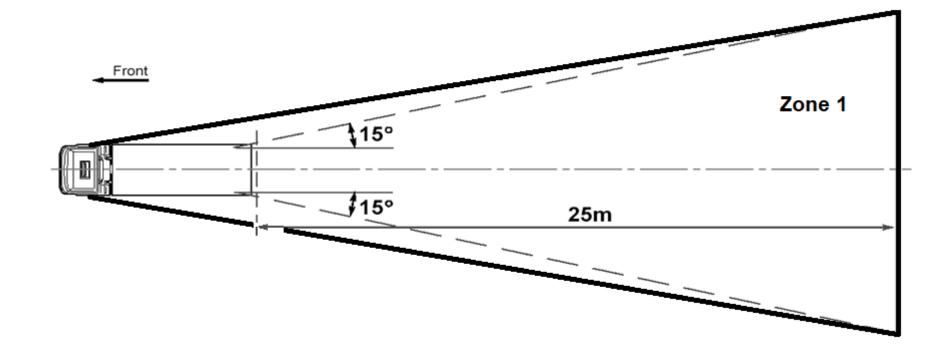

Figure 3a

"To the front" of the vehicle means:

If viewed from an observer moving within an area shown in the diagram below (Zone 2), the sides of which are at an angle of 15 degrees out from the extreme outer edge of the vehicle starting from the front corner and extending up to **25m** from the front of the vehicle (measured along the vehicle longitudinal), no light other than a white light (with the exception of an amber light from a direction indicator, an amber light from a hazard beacon/warning lamp, a yellow light from a front fog lamp, a yellow light from a front end outline marker lamp, an amber light from a side marker light, a red light from a rearmost side marker or rear position lamp; and emergency vehicles only, a blue light from a warning lamp or beacon) is permitted to be visible in this area.

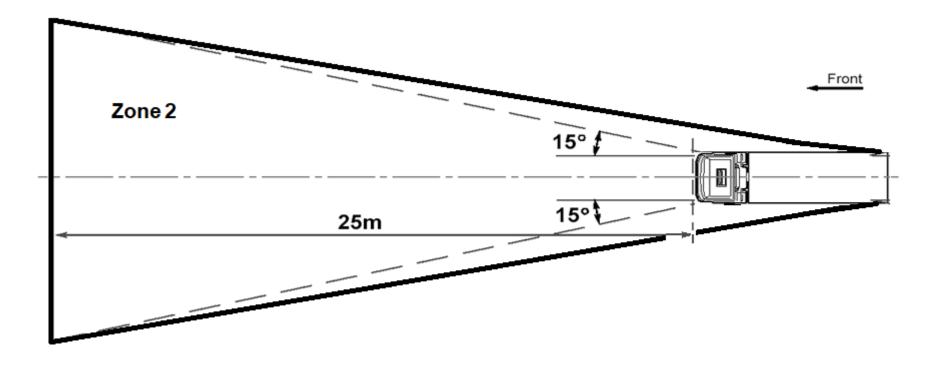

Figure 4

If the total of the red area is 60% or more of the area drawn around the lamps, the lamps are considered to be one lamp.

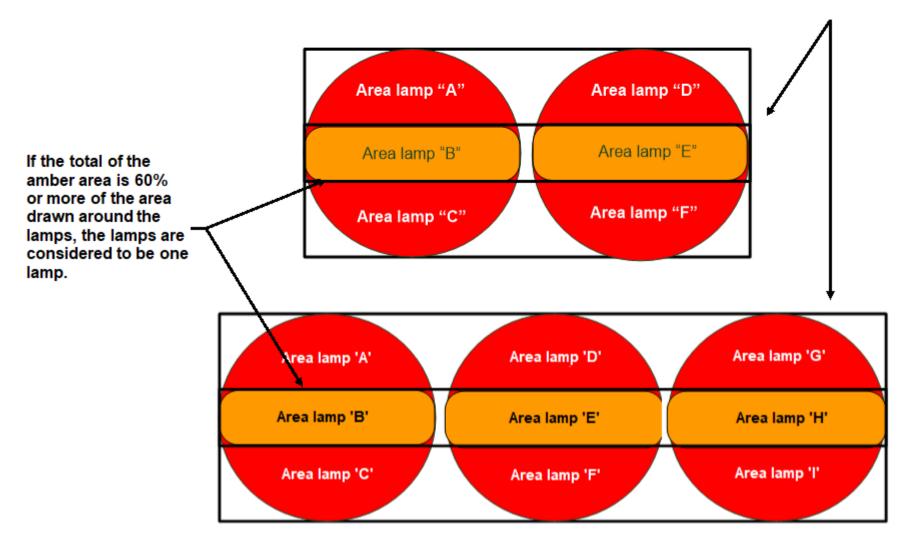

Figure 4a

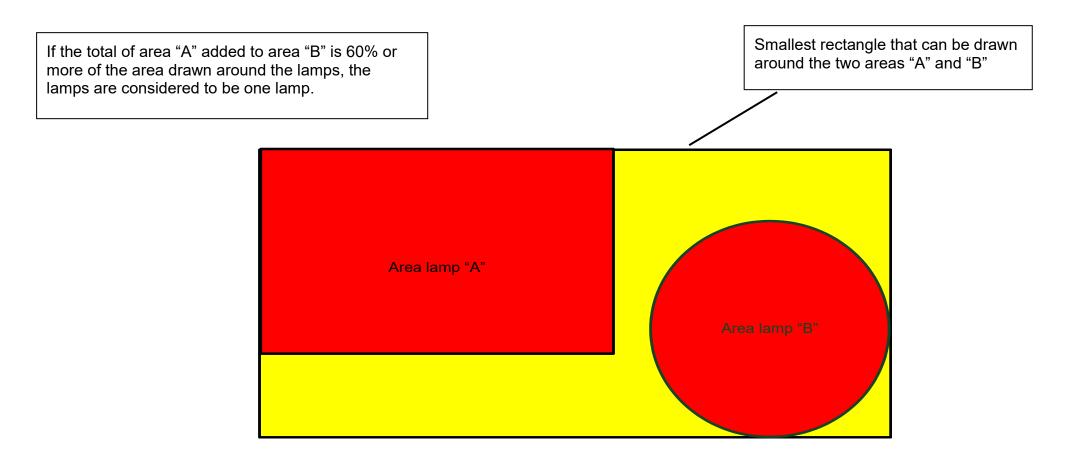

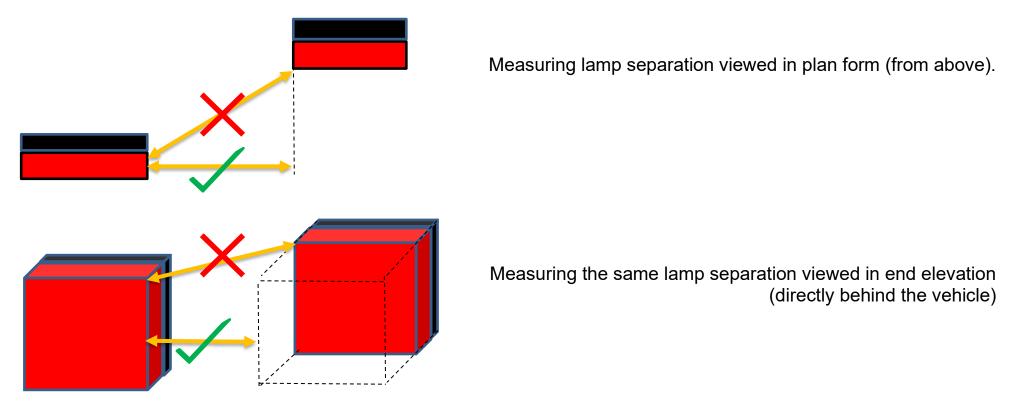

Figure 5

The methodology for assessing lamp separation.

Reg 48.03 EOM (6.13.9) requirements:

The position of an end outline marker lamp in relation to corresponding position lamp shall be such that the distance between the projections on a transverse vertical plane of the points nearest to one another on the apparent surfaces in the direction of the respective reference axes of the two lamps considered is not less than 200 mm.

Note: Check each lamp against its specified separation dimension in its section of the manual. This applies equally to Conspicuity Markings.

Record of Revision

Revision	Date	Description of Change
1	24/04/2009	
2	16/08/2010	Add RS3, add Note 3 and link to RS5c
3	31/07/2011	Add bullet points for conspicuity markings to RS1 and RS2
4	03/02/2014	Remove reference to Notes 1 & 2, Note 3 becomes Note 1, insert two new paragraphs in Mol & new Figure 4
5	29/10/2014	First paragraph of Mol corrected
6	10/04/2018	Amend Figure 4
7	01/09/2020	Insert new Figure 5.
8	20/10/2023	Revise RS1 to Include allowance of red light from front (TSE IVA N2N3 020 008). Revise Fig 3 to define zone area, and insertion of Figure 3a diagram and associated text to clarify 'view to the front and rear' (TSE IVA N2N3 020 008). Revise RS6 to clarify 'fixed open position' & create Note 2 referenced from RS6. (TSE IVA N2N3 020 006). Revision of Figure 4 to align with other IVA manuals. (TSE IVA N2N3 020 007).

21 Retro Reflectors

Application: Reflectors: All Vehicles,

Conspicuity Markings: Rigid Vehicles over 7500kg DGW, over 6.0 metres long and over 2.1 metres wide

Method of Inspection

Carry out a visual check of all retro reflectors conspicuity marking, and rear markers fitted to the vehicle for colour, number, approval markings and correct positioning.

Vehicles are required to have a full contour marking on the rear, i.e., horizontal, and vertical markings to outline the shape of the vehicle, and partial contour markings on the side. Partial contour markings consist of a horizontal line showing the length of the vehicle and 'tick' marks showing the upper corners of the vehicle (see figure 1, 2 & 3).

Note 1: Geometric angles of visibility and positional requirements are not required for all optional reflectors, or markers.

Note 2: Where the shape, structure, design, or operational requirements make it impossible to install the mandatory contour marking, a line marking is acceptable. (See figure 6).

Note 3: Example of an Approval Mark

104 R - 0001148

Symbol "C" indicates the class of the retro-reflective material which is intended for contour/strip marking.

Required Standard

Reflectors;

- 1. All reflectors must be 'e' or 'E' marked, and where applicable, bear the appropriate identity marking as listed in Table 1.
- 2. The correct number must be fitted to the vehicle (Table 1).
- **3.** The correct colour must be fitted to the vehicle (Table 1).
- **4.** They must be positioned to meet: (see **Note 1**)
 - a) the positional requirements of Table 1
 - b) the angles of visibility requirements of Table 1
- **5.** They must be of the correct shape (Table 1).
- 6. Rear reflectors must face predominately to the rear.

Conspicuity Markings; vehicles over 7500kgs DGW, over 6.0m long and over 2.1m wide

- 7. Full or part conspicuity markings must be fitted (see **Note 2**)
- 8. All conspicuity marking material must be of an approved type (see **Note 3**).
- **9.** There must be at least one visible approval mark on any element of a retroreflective marking material fitted to each face of the vehicle (O/S, N/S & Rear).

Method of Inspection

Note 4: Markings are considered continuous if gaps are less than 50% of the length of adjacent elements, However, if the manufacturer can prove to the satisfaction of the authority responsible for type approval that it is impossible to respect the value of 50 per cent, the distance between adjacent elements may be larger than 50 per cent of the shortest adjacent element, and it shall be as small as possible and not exceed 1000 mm.

Note 5: If 1500mm is not practicable this can be increased to 2500mm.

Note 6: Rear marker plates (R70.01) count towards cumulative total width of conspicuity marking.

Note 7: The 70% (minimum) is calculated based on overall vehicle length. The figure you arrive at must be distributed over the cab and body, i.e., assuming the vehicle was 10 metres long then the marking must equate to at least 7 metres. This 7 metres (or more if required) of marking must then be distributed across both the cab and the body, there is no requirement for 70% of the cab to be marked.

Note 8: Markings on vehicle cabs are only required to comply with RS8, 10, 11, 12, 13, 17 & 18

Note 9: Where it is impractical to meet the dimension stated in RS21, e.g., due to the position of load covers or similar equipment, full or partial upper markings (where fitted) should be located as close as is practical to the upper extremity.

Note 10: The 250mm must be measurable on a flat plane. If the mark is fitted to a shaped surface (e.g., corrugations) the mark must be extended so that at least 250 mm is visible form the side.

Required Standard

- **10.** The maximum gap between adjacent elements must be no greater than 50% of the smallest adjacent element (see **Note 4**).
- **11.** The lowest edge must be between 250mm and 1500mm from the ground (see **Note 5 & Figures 4,6 & 8**).
- **12.** The minimum width of the markings must be at least 50mm.
- **13.** The maximum width of the markings must be no greater than 60mm.

Rear Conspicuity Markings; vehicles over 7500kg and over 2.1m wide

- **14.** must be coloured either red or yellow
- **15.** must equate to at least 70% of the overall vehicle width (see **Note 6** & **Figure 5**)
- **16.** must be at least 200mm away from any brake mandatory light (see **Figure 4 A**)

Side Conspicuity markings; vehicles over 7500kg and over 6m long

- **17.** must be coloured either white or yellow
- 18. must extend within 600mm of either end of the vehicle (see Figure 2)
- **19.** must equate to at least 70% of the overall vehicle length (see **Notes 7 & 12** and figure 8)

Vehicle Cabs (except Tractor Units)

20. must be fitted with line markings (see Notes 8 & 12)

Method of Inspection	Required Standard
Note 11: Rear markers are not required to be fitted as long	If Full or Partial Contour Markings are fitted
as the vehicle has been fitted with Conspicuity Markings	
which comply to the required standards of this section.	21. The maximum height must be as close as is practical to the top of the body. (see Figure 2) (see Note 9).
Note 12: An alternative marking mode within 2,400 mm	
from the front end of the motor vehicle is allowed where a series of retro-reflectors of Class IV A of Regulation No. 3 or Class C of Regulation No. 104 are mounted followed by	22. The vertical aspect of marking must be as close to the edge as practicable. (see Figure 4 B).
the required conspicuity marking as follows: (a) Retro-reflector size minimum 25 cm ² ;	23. Each side of a Tick Marking must be at least 250mm (see Note 10 and figure 3).
(b) One retro-reflector mounted not more than 600 mm from the front end of the vehicle;	Rear Markers; vehicles over 7500kgs (if fitted)
(c) Additional retro-reflectors spaced not more than 600 mm apart;	24. All rear markers must bear a genuine permanently attached 'e' mark.
(d) The distance between the last retro-reflector and the start of the conspicuity marking shall not exceed 600 mm.	25. A minimum of one set of obligatory markers must be fitted to the vehicle (see Note 11 and Table 2).
	26. They must be positioned correctly to meet the positional requirements of Table 2.
	27. They must be of the correct type (Table 2).

Table 1

	NUMBER	APPLICATION	COLOUR	POSITION			ANGLES OF VISIBILITY	APPROVAL MARK "E" or
TYPE				MAX DISTANCE FROM SIDE (mm)	MAX HEIGHT (mm)	MIN HEIGHT (mm)	See Figures 1 & 2 of section 20	"e" Identity Symbol or BS Mark / Notes

Figure 4

Rear marker plates are optional (A,B & C)

Where fitted rear marker plates may only be counted as contributing to the rear contour marking (C) provided they comply with UNECE Regulation 70.01

Marker plates approved to UNECE Regulation 70.00 do not count towards the conspicuity marking

Revision: 11 Date: 20/10/2023 6 of 10 Retro Reflectors 21

Figure 5 Figure 6 Markings are considered continuous if gaps Markings must cover at least 70% of are less than 50% of the length of adjacent the overall vehicle width elements Typical example of a vehicle only requiring a line marking The lowest edge must be between 250mm and 1500mm from Figure 8 Figure 7 the ground. If 1500mm is not practicable this can be increased to 2500mm Markings must cover at least 70% of the overall vehicle length

Table 2

1. Description						
A motor vehicle the overall length of which does not exceed 13m:	A rear marking of a type shown in diagram 1, 2, 3 or 4 in Part III of this Section.					
A motor vehicle the overall length of which exceeds 13m:	A rear marking of a type shown in diagram 5, 6, 7 or 8 in Part III of this Section.					
2. Position						
Longitudinal:	At or near the rear of the vehicle.					
A rear marking of a type shown in diagram 2, 3, 4, 6, 7 or 8 in Part III of this Section:	Each part shall be fitted as near as practicable to the outermost edge of the vehicle on the side thereof on which it is fitted so that no part of the marking projects beyond the outermost part of the vehicle on either side.					
A rear marking of a type shown in diagram 1 or 5 in Part III of this Section:	The marking shall be fitted so that the vertical centre-line of the marking lies on the vertical plane through the longitudinal axis of the vehicle and no part of the marking projects beyond the outermost part of the vehicle on either side.					
Vertical:	The lower edge of every rear marking shall be at a height of not more than 1700mm nor less than 400mm above the ground whether the vehicle is laden or unladen.					
3. Visibility:	Plainly visible to the rear.					
4. Alignment:	The lower edge of every rear marking shall be fitted horizontally. Every part of a rear marking shall lie within 20° of a transverse vertical plane at right angles to the longitudinal axis of the vehicle and shall face to the rear.					
	An approval mark to ECE Regulation 70 or 70:01 RF					
5. Markings	Example Marking E1 01148					
6. Colour:	Red fluorescent material in the stippled areas shown in any of the diagrams in Part III of this Section and yellow retro reflective material in any of the areas so shown, being areas not stippled and not constituting a letter.					

Part III

Rear markings prescribed for motor vehicles having a maximum gross weight exceeding 7500 kg (where required to be fitted)

Record of Revision

Revision	Date	Description of Change
1	24/04/2009	
2	16/08/2010	RS6 and 10 added and link note 1 to RS4
3	31/01/2011	Add Conspicuity Markings
4	31/07/2011	Amend Conspicuity Marking section
5	30/04/2012	Add Rigid to application box, re order standards and renumber, add example marking for Marker Boards
6	29/10/2012	Insert new paragraph in MoI, reword statement on Figure 4 and remove labelling from tanker in Figure 7
7	03/02/2014	Remove para 2 from MoI,, reword paragraph 1, Note 1, insert new note 2, renumber remaining notes and insert new note 9.
8	29/10/2014	Conspicuity width and length requirement reduced from 80% to 70%, RS 15 & 19, figures 5 & 8 updated. New note 11 added link from RS 23. Height requirement has changed from 400mm to as close as practical, RS21 & Fig 2 updated.
9	01/09/2015	RS 21 referred to note 9
10	01/09/2020	New Note 12 permitting alternative conspicuity markings to the side of the vehicle (up to 2.4 m from the front).
11	20/10/2023	Amend Table 1 Max. Height Side Retro Reflectors. Add minimum height requirement to Figures 4, 6 & 8 referenced from RS11.

22 End-outline, Position (Side), Stop, Side Marker & Daytime Running Lamps

Application: All Vehicles

in conjunction with direction indicators.

Method of Inspection	Required Standard
Carry out a visual check of all outline marker, position, stop, side marker and daytime running lamps fitted to the vehicle for operation, colour, number, approval markings and correct	All lamps must be 'e' or 'E' marked and where applicable, bear the appropriate identity marking as listed in table 1.
positioning.	2. The front and rear position lamps, end outline marker lamps and side marker lamps, (if fitted) must be switched on and off by the operation of one switch
With optional lamps check that fitment is permitted and they do not exceed the maximum number of lamps allowed to be fitted.	(see Note 1).
	Front and Rear Position Lamps;
In addition to the Required Standards, vehicles MAY have EITHER of (1) or (2) below:	3. The correct number must be fitted to the vehicle (Table 1).
(1) Direction indicator side repeater lamps Three category 5 side repeaters distributed as evenly as	4. They must be operational.
practicable along each side	5. They must only emit white light to the front / red light to the rear.
OR	6. They must be positioned to meet (see Note 2).
(2) Flashing Side marker lamps Mandatory amber side marker lamps may flash	a. the positional requirements of Table 1
simultaneously with the direction-indicator lamps on the same side of the vehicle.	b. the angles of visibility requirements of Table 1
	Stop Lamps;
Only one of the above specific combinations is allowed, no other combination is acceptable	7. The correct number must be fitted to the vehicle (Table 1).
Where (2) above is used, there is NO requirement for the side marker lamps to be marked in addition as side repeater lamps	8. They must be operational.
Note 1: standard does not apply when side marker lamps flash	9. They must only emit red light.

End-outline, Position (Side), Stop, Side Marker & Daytime Running Lamps 22

Revision: 9 Date: 20/10/2023 1 of 8

Method of Inspection	Required Standard
Note 2: Geometric angles of visibility and positional requirements are not required for all optional position lamps, stop lamps and end outline marker lamps.	10. They must only illuminate when the service brake is applied and must extinguish when the service brake is released.11. They must be positioned to meet (see Note 2)
Note 3: The inspection of the side marker lamps applies to the obligatory lamps fitted to all vehicles exceeding 6m in length. Note 4: The correct orientation for side marker lamps is not required on the boom of Crash cushion vehicles.	 a. the positional requirements of Table 1 b. the angles of visibility requirements of Table 1 Side Marker lamps; (see Notes 3 & 4)
Note 5: The inspection of end-outline marker lamps applies to the obligatory marker lamps fitted to vehicles exceeding 2.10m in width. Note 6: Both front and rear end outline marker lamps can be combined in one device.	12. The correct number must be fitted to the vehicle (in accordance with the positional requirements).13. They must be operational.14. They must emit an amber light (red is acceptable if within 1 metre of the
Note 7: There is no requirement for special bracketry to be manufactured in order to accommodate these lamps. Note 8: Daytime running lamps The lamps must be connected so that they switch off automatically when the	rear). 15. They must be positioned to meet a. the positional requirements of Table 1
headlamps are on.	b. the angles of visibility requirements of Table 1 End Outline Marker Lamps; (see Notes 5, 6 & 7)
	16. The correct number must be fitted to the vehicle (Table 1).17. They must be operational.
	18. They must only emit red light to the rear / white light to the front.19. The lights must be a minimum of 200mm from a positional lamp.

Revision: 9 Date: 20/10/2023 2 of 8

Method of Inspection	Required Standard
	20. They must be positioned to meet (see Note 1)
	a. the positional requirements of Table 1
	b. the angles of visibility requirements of Table 1
	Daytime running lamps; (if fitted)
	21. The correct number must be fitted to the vehicle (Table 1).
	22. They must be operational.
	23. They must only emit white light to the front.
	24. They must be positioned to meet
	a. the positional requirements of Table 1
	b. the angles of visibility requirements of Table 1
	25. They must extinguish automatically when headlamps are operated. (see Note 7).

23 Direction Indicators

Application: All Vehicles

Method of Inspection	Required Standard
Carry out a visual check of all direction indicator and side repeater lamps fitted to the vehicle for operation, colour,	Directional Indicators;
number, approval markings and correct positioning.	1. All lamps must be 'e' or 'E' marked and where applicable, bear the appropriate identity marking as listed in table 1.
With optional lamps check that fitment is permitted and they	
do not exceed the maximum number of lamps allowed to be fitted.	2. They must be operational.
	3. The correct number must be fitted to the vehicle (Table 1).
The inspection of hazard warning lamps applies to all the	
obligatory direction indicator and side repeater lamps fitted to the vehicle.	4. The indicators must flash at a rate of between 60 and 120 times a minute (with all mandatory indicators working, and with the engine running if initially below the requirement).
Two additional lamps may be fitted to a STGO - Abnormal	,
Indivisible Load Vehicles (GTW of at least 120,000kg).	5. There must be an audible or visual tell-tale fitted to indicate the non-operation of any indicators.
In addition to the Required Standards, vehicles MAY have	· ·
EITHER of (1) or (2) below:	6. All indicators must emit amber light.
(1) Direction indicator side repeater lamps Three category 5 side repeaters distributed as evenly as	7. They must be positioned to meet (see Note 1)
practicable along each side OR	a. the positional requirements of Table 1
(2) Flashing Side marker lamps. Mandatory amber side marker lamps may flash	b. the angles of visibility requirements of Table 1
simultaneously with the direction-indicator lamps on the same side of the vehicle.	Hazard Warning Lights
	8. They must operate with the ignition switched on and off.
Only one of the above specific combinations is allowed, no	• The heart warning device must energte all of the direction indicators
other combination is acceptable.	The hazard warning device must operate all of the direction indicators simultaneously.

Direction Indicators 23

Method of Inspection	Required Standard
Where (2) above is used, there is NO requirement for the side marker lamps to be marked in addition as side repeater lamps.	The hazard warning device must have a tell-tale warning light fitted which is circuit specific.
Note 1: Geometric angles of visibility and positional requirements are not required for all optional direction indicator lamps.	
Note 2: Two additional lamps may be fitted to a special purpose vehicle designed for use with equipment that may obstruct the mandatory devices. Where additional dipped beam headlamps are fitted using the waiver in Note 4(b) to section 25, these additional indicator lamps may be mounted at a similar height to the dipped beam headlamps.	

Table 1

25 Headlamps

Application: All Vehicles

Mathad of Increation	Paguirod Standard
Method of Inspection	Required Standard
Carry out a visual check of all headlamps fitted to the	Headlamps;
vehicle for operation, colour, number, approval markings	4 AU 1 () (=)
and correct positioning.	 All lamps must be 'e' or 'E' marked and where applicable, bear the appropriate identity marking as listed in table 1.
With optional lamps check that fitment is permitted and	
they do not exceed the maximum number of lamps allowed to be fitted.	2. They must be operational.
	3. All obligatory and optional headlamps must be fitted as "matched pairs".
Where vehicles are fitted with Gas Discharge or LED	
Headlamps there is no requirement for headlamp cleaning if the light output is below 2000 Lumens (evidence must be	4. They must emit a white light.
provided).	5. When on dip or main beam they must emit sufficient light to be able to illuminate
	the road in front of the vehicle.
In the case of a dipped beam headlamp the minimum	
height is measured to the lower edge of the light emitting surface.	6. The correct number must be fitted to the vehicle (Table 1).
	7. Dipped beam headlamps must be positioned to meet the requirements of Table
Note 1: The "Main Beam" tell-tail can be either blue in colour, or a tell-tale (any colour but preferably blue) with	1.
the symbol (see section 33) or a tell-tale any colour and	8. There must be a tell-tale when on main beam (see Note 1).
the words Main Beam or Main.	
	Gas Discharge and L.E.D Headlamps
Note 2: The alignment requirement must be met without	
the use of masks or beam converters unless they are an	9. Must be accompanied by evidence of compliance with the technical requirements
integral part of the headlamp as it was approved. Devices	if not compliant with the following:
or materials applied to the inside of a headlamp which	Sa UEU an Uau andar d
were not present at the time of approval are unacceptable.	• is "E" or "e" marked
	dipped beam remains on when main beam is on (gas discharge only)
Some vehicles may be fitted with an in-car driver's	is fitted with a wash system
headlamp adjustment device. This may be adjusted to	is fitted with an automatic headlamp self-levelling system or self-levelling
enable both headlamps to meet the criteria. Both	suspension.

Method of Inspection

headlamps, however, must comply with the requirements with the device set in **one** position.

Align the headlamp aim testing equipment to the vehicle in accordance with the manufacturer's instructions. With an assistant sitting in the driver's seat, check the alignment of each dipped beam headlamp in association with the appropriate criteria.

Note 3: Example of marking showing the vertical downwards inclination of the dipped-beam headlamps when the vehicle is at its kerbside weight and has a weight of 75 kg on the driver's seat.

Note 4 Two additional dipped beam headlamps forming a matched pair with electrical connections that permit only one pair to operate at any one time and fitted to:

- (a) a vehicle intended for use in both left hand and right hand rule of the road traffic and in which case one pair must meet the requirements for right hand rule of the road traffic: **or**
- (b) a special purpose vehicle designed for use with equipment that may obstruct the mandatory devices and mounted higher than the mandatory devices but as low as practicable whilst ensuring maximum geometric visibility, notwithstanding that in some positions of movable equipment, the headlamp may be obscured. Headlamps fitted by the OEM should be considered to comply with this requirement. The aim of the lamps only needs to be assessed visually to check that they illuminate the road directly in front of the vehicle.

Required Standard

Headlamp Aim (see Note 2)

European Type (checked on dipped beam)

- **10.** The beam image 'kick-up' must not be to the offside.
- **11.** For headlamps with centres not more than 850mm from the ground, the beam image horizontal cut-off must be between the horizontal 0.5% and 2% lines, i.e., the red tolerance band.
- **12.** For headlamps with centres more than 850mm from the ground, the beam image horizontal cut off must be between the horizontal 1.25% and 2.75% lines, i.e., the blue tolerance band (see **Note 4**).
- **13.** The beam image 'break point' must not be to the right of the 0% vertical line, or to the left of the vertical 2% line.
- **14.** The vehicle must be marked with a clearly legible and indelible marking showing the setting recommended by the manufacturer for the downward inclination of the horizontal part of the cut-off of the beam pattern of the dipped-beam headlamps, and that setting shall be a single figure (see **Note 3**).
 - **a.** between 1 and 1.5 per cent if the height of the centre of the headlamp is not more than 850 mm above the ground, and
 - **b.** between 1 and 2 per cent if the height of the centre of the headlamp is more than 850 mm above the ground.

European Type Headlamp Checked on Dipped Beam

Check the position of the 'break point' and horizontal cut-off.

31 Seat Belts

Application: All Vehicles

Method of Inspection

Disabled persons belts

Disabled person belts are seat belts which have been specially designed or adapted for use by an adult or young person suffering from some physical or mental impairment, intended for use solely by such a person and as such are exempt the requirements of this section, however the belt must be securely attached and appear to operate as intended.

Seats not intended for road use

- (a) The requirements of this section do not apply to seats intended for use solely while the vehicle is stationary or for when the vehicle is not used on a public road.
- (b) Any seats which are not for use when travelling on a public road must be clearly identified to users by means of a pictogram or a sign with appropriate text.

Where optional belts are fitted they must comply with the requirements of this section.

In the case of **armoured vehicles** exemption from any requirement of this section is permitted if it can be demonstrated to the satisfaction of the Approval Authority that it is impossible for the vehicle to comply due to its special purpose.

Note 1: A suitable single bolt fixing of adequate strength would be, for example, a bolt of at least 11mm (7/16") diameter of grade 8.8 (the grade may not be shown on a bolt produced for a seat belt anchorage) Other bolt fixings may be acceptable providing they are of equivalent strength. Two adjacent seat belts may be secured by one bolt. In this case consideration must be given to the additional loads on the

Required Standard

- **1.** Each seat requiring a seat belt must be fitted with a seat belt of the appropriate type. See Annex 1.
- **2.** Each seat belt must bear an appropriate "e" approval mark..
- **3.** Where seats are intended for use **only** when the vehicle is **not** being driven on public roads, the seats must be accompanied by a pictogram or sign clearly indicating that the seat is not to be used whilst the vehicle is in motion.
- **4.** Each seat belt must be attached by an appropriate fixing and be securely fitted (see **Notes 1 & 2**).
- **5.** There must be no damage to the seat belt structure that would affect its strength.
- **6.** The lock mechanism must securely lock the belt.
- **7.** The lock mechanism must be able to be released easily, both in normal use and when the belt is under load.
- 8. The retractor mechanism must be of an acceptable type and be correctly positioned to ensure the correct operation of the belt (see Notes 3 & 4).
- **9.** With the seat belt fastened and the seat unoccupied, retractor mechanisms must take up any excess webbing (see **Note 5**).

Seat Belts 31

Revision: 8 Date 10/04/2018 1 of 8

Method of Inspection

anchorage.

Note 2: In order that a seat belt can be separated from the anchorage without causing damage to the anchorage, for example a mounting in the side of a tube or box section, it is a requirement that the bolt is secured into a "fixed" threaded hole or captive nut. (The presenter may be required to demonstrate this condition is met). The bolt may be secured into an alternative fixing, e.g., a lock nut of suitable strength, where access is provided to the "rear" of the mounting to enable separation/re-attachment of the belt.

Note 3: A belt may be fitted with retractor mechanisms on both lap and diagonal sections. If fitted with a single retractor mechanism it must act initially on the diagonal (shoulder) section.

Note 4: An "automatically locking" retractor (i.e., one that allows extension of the belt to the desired length and when the buckle is fastened locks on retraction but then prevents subsequent forward movement by the wearer, unlike a typical inertia reel belt), is not permitted unless the feature is only provided after **full extension** of the belt from the retractor, i.e., for use as a child restraint.

Note 5: Some types of retracting belt might need assistance in order to retract.

Note 6: Where a seat belt is not integral with the seat as approved, check that whilst sitting in each seat in turn, and wearing the seat belt, secured and correctly adjusted, that the position of the webbing on the torso and the location of the **effective belt anchorage** points in relation to the seated body position are correct.

Note 7: The seat belt must be capable of effectively restraining the occupant.

 by the position of the lap belt (due to anchorage location) passing over the pelvic region

Required Standard

- **10.** The seat belt must sit correctly across the wearers torso so as to provide effective restraint in the event of a frontal impact (see **Notes 3,4,6,7 & 8**).
- **11.** There must not be any sharp edges / objects in the seat belt area likely to cause damage to the belt.
- **12.** Where an airbag is fitted in front of a passenger position, a warning label for the airbag must be permanently fixed to the vehicle.
- **13.** The warning label for the airbag must be visible in front of a person about to install a rearward facing child restraint.

- **14.** The warning label for the airbag must be visible when the door is closed otherwise a permanent reference elsewhere that is visible at all times is required.
- **15.** A harness or three point belt "effective upper anchorage" location must be at least 450mm above the reference point. (see **Note 9** and figure 1).
- 16. A lap/diagonal belt "effective upper anchorage" location must be at least 140mm from the longitudinal centre line of the seat. (see Note 9).

Seat Belts 31

Method of Inspection	Required Standard
 in the case of a harness belt or three point belt, by being positioned across the shoulder so that it does not slip off the shoulder of the occupant. Note 8: Where the seat is adjustable, this check must be carried out with the seat secured in the rearmost position and with the back rest in the normal driving position, in any case at a rearward angle of not more than approximately 25° from the vertical. Note 9: The effective belt anchorage is the actual anchorage point to the vehicle unless a change of direction of the belt to the wearer is produced by a fixed intermediate device, for example, a belt guide fitted to the upper part of a seat back, consideration should be made to the suitability of the seat to withstand the loads likely to be imposed. The requirements Section 19 RS 3 apply to the effective anchorage location. Note 10: Seats may vary by only 10 degrees from either the forward or rearward facing direction before they become side facing. 	 17. The lower anchorages must be at least 350mm apart. 18. The lower anchorages on side facing seats must be at least 350mm apart but no further apart than 500mm (see Note 10).

Annex 1

Seat Belts – Minimum Obligatory Requirements see Table Note 3

Vehicle category	Front facing						Side facing Seat

From 30/9/2001	3 Point retractor belt or Lap belt	3 Point retractor belt or Lap belt	None	2 Point lap belt see note 1 below	None	None	None

TABLE NOTE 1: As determined by Annex 2 the front centre seat will require 3 anchorages and a 3 point belt where the windscreen is located

- in the case of a fixed (non-sliding) seat, within 840mm. of the seat reference point
- in the case of a sliding seat, within 840mm. of the seat reference point when the seat is 127mm forward of its rearmost position.

TABLE NOTE 2: '3 point belt' means a seat belt which:

- restrains the upper and lower parts of the torso
- includes a lap belt and a retractor that operates on the diagonal part
- is anchored at not less than three points, and
- is designed for use by an adult.

TABLE NOTE 3: The table lists the minimum required belt type. A 3 point retractor belt may be fitted where the minimum required is a 2 point lap belt and an acceptable alternative to any of the seat belt types listed is an adult harness belt comprising a lap belt and shoulder straps providing the anchorages satisfy section 19

TABLE NOTE 4: Outboard seats are seats closest to the vehicle sides and front seats are those foremost in the vehicle.

33 Identification of Controls

Application: All Vehicles

Method of Inspection

This inspection is to ensure that any controls, tell-tales, and indicators fitted to the vehicle are readily identifiable, useable and of the correct colour.

Where a control, tell-tale or indicator are combined, a common symbol may be used for such a combination.

Note 1: A **control** means that part of a device which enables the driver to bring about a change in the state or functioning of the vehicle.

An **indicator** means a device which presents information on the functioning or situation of a system or part of a system. e.g., fluid level.

A tell-tale means an optical signal which indicates the actuation of a device, correct or defective functioning or condition, or failure to function.

Note 2: Symbols as shown in Table A, these symbols may differ slightly as long as they cause no confusion to the driver.

Note 3: Controls, tell-tales and indicators listed in Table B are not required to be marked. However, present symbols must conform to those listed. These symbols may differ slightly as long as they cause no confusion to the driver.

Note 4: Other controls, tell-tales and indicators may be marked provided there is no confusion with those marked in accordance with those on Table A or B.

Required Standard

Symbols as shown in Table A and B

- 1. The controls, tell-tales and Indicators must be identified with the correct symbols and the stated colour: (see **Notes 1, 2, 3 & 4**)
- **2.** They must be on or close to the controls, tell-tales, and indicators.
- **3.** They must stand out clearly from the background.
- **4.** The vehicle must not be fitted with other controls, tell-tales and indicators that have symbols that may be confused with the symbols listed in Tables A and B (see **Note 5**).
- **5.** All symbols must contrast with the background and be identifiable by the driver.
- **6.** All driver controls must be able to be operated from the driver's seat.

Information Display Device Fitted (See Note 5)

- **7.** It must be able to display simultaneously the warning symbols for brake, main beam, and direction indicator.
- **8.** It must provide the relevant information regarding tell tales and indicators whenever the situation that causes them to operate arises.

Identification of Controls 33

Revision: 3 Date: 31/01/2011 1 of 6

Method of Inspection	Required Standard
Note 5: An information display device is a device capable of displaying more than one type of message or information. The requirements regarding colour do not apply to tell-tales and indicators appearing on the Information Display Device.	9. Must repeat automatically in sequence or indicate in such a manner that it is visible to and identifiable to the driver when two or more messages are given.

42 Lateral Protection

Application: All Vehicles

Method of Inspection

A vehicle of category N2 or N3 is not required to be fitted with a separate lateral protection device, providing the sides of the vehicle are so designed and/or equipped that by their shape and characteristics their component parts together meet the requirements in standards 2 to 18.

On a vehicle fitted with extendible legs to provide additional stability during loading, unloading or other operations for which the vehicle is designed, the side guard may be arranged with additional gaps where these are necessary to permit extension of the legs.

On a vehicle equipped with anchorage points for ro-ro transport, gaps shall be permitted within the side guard to accept the passage and tensioning of fixing lashings.

Vehicles where the distance between centres of two consecutive axles is greater than 3 metres must be fitted with Lateral Protection unless listed below.

Exempt Vehicles:

Tractors for articulated vehicles.

Road sweepers (A vehicle fitted with specialised equipment for sweeping streets).

Car transporters (vehicles with more than one loading deck, designed to carry other vehicles loaded on from

Required Standard

1. Where the side of the body does not meet the requirements, a side guard device must be fitted.

Requirements for both body sides and separate devices:

Required area to be protected

- **2.** The device or body side must have its rearward edge extended to within 300mm of the tyre on the first rear axle (see **Note 1** and figure 4).
- 3. The device or body side must have the front edge of the guard within 300 mm of the rear of the tyre on the front wheel (or second wheel if two front axles are fitted) (see **Note 2** and figure 4). Where stabiliser legs are fitted see **Note 2**.
- 4. The device or body side must be within 350 mm of the body line (see **Note 3**).
- **5.** The device or body side lower edge must be no higher than 550 mm from the ground.

Within the required area the following standards must be met

- **6.** The device or body sides must be constructed of a suitable material and must be of sufficient strength as to offer effective protection to unprotected road users (see **Note 4**).
- **7.** The device or body side must have a smooth or horizontally corrugated surface (see **Note 5**).
- **8.** Any external edges including corners must be rounded with a radius of at least. 2.5mm

Method of Inspection

the rear) exempt where the chassis rails are on the extremities of the vehicle

Gulley emptiers, where fitting of a lateral protection device **prevents** the use of the suction tube (not merely hinders).

Vehicles specifically designed and constructed for a purpose where the fitment of a lateral protection device would prevent the use of that equipment fitted (not merely hinders).

A tank-vehicle that is a vehicle designed solely for the carriage of fluid substance in a closed tank permanently fitted to the vehicle and provided with hose or pipe connections for loading or unloading, shall be fitted with side guards which comply so far as is practicable with all the requirements of this section; strict compliance may be waived only where operational requirements make this necessary.

Vehicles designed and constructed for special purposes where it is not possible, for practical reasons, to fit lateral protection devices.

STGO Exempt Vehicles:

Road Recovery Vehicles (RRV),

Engineering Plant, only where the fitment of a lateral protection device would prevent the use of specialist equipment fitted (not merely hinders).

Note 1: The measurement is taken to a vertical plane extending from the surface of the tread closest to the guard or relevant body work.

Required Standard

- There must be no projecting brackets, bolt heads or similar protrusions (see Notes 5 & 7).
- 10. The device or body side must be continuous in length (see Note 8).
- **11.** The device or body side must not have the rearward end more than 30mm inboard from the outermost edge of the rear tyres over at least the last 250mm of the device / body (see figure 1).
- **12.** Where the 300mm dimension required in standard 3 results in the forward edge of the guard being forward of the rear cab panel. The device or body side must be constructed so that the forward end is beneath the cab panel work. Where the vehicle cab is narrower than the body then the side guard may be angled to meet this requirement and be turned inwards through an angle of not more than 45 degrees (see **Note 9**).

Where equipment is incorporated into the side guard,

- **13.** The equipment must have a smooth substantially flat or horizontally corrugated outer surface (see **Note 5**).
- **14.** There must not be a gap of more than 25 mm between it and the guard or body side (see **Note 2** and figures 3 & 5).
- **15.** Where necessary the equipment must meet any required dimensional requirement as if it was part of the device.
- **16.** There must be no projecting brackets or hinges unless sufficiently radiused from all aspects (see **Note 6**).
- 17. It must not have protruding bolt heads or similar projections (see Note 6).
- **18.** Any external edges and corners must be rounded with a radius of at least 2.5mm.

Method of Inspection

Note 2: A gap of 130mm either side of a crane / stabiliser leg is permitted see figure 5.

Note 3: The 'Body Line' is that part of the structure of the vehicle, cut or contacted by a vertical plane tangential to the outer surface of the tyres, except in the following cases:

Where the plane does not cut the structure of the vehicle, the upper edge must be level with the surface of the load-carrying platform

OR

950mm from the ground, whichever is the less.

Where the plane cuts the structure of the vehicle at a level more than 1.3m above the ground, then the upper edge of the side guard must not be less than 950mm above the ground.

Note 4: "Unprotected road users" means pedestrians, cyclists or motor cyclists using the road in such a way that they are liable to fall under the sides of the vehicle and be caught under the wheels.

Note 5: Any adjacent parts may overlap providing that all overlapping edges face rearwards or downwards.

Note 6: Dome shaped bolt heads and rivets, or other parts provided they are similarly rounded and smooth protruding to a maximum of 10mm in height are acceptable.

Required Standard

Additional requirements for separate devices

- **19.** The device must be attached securely.
- 20. The device must consist of at least one horizontal rail (see Note 3).
- **21.** Where more than one horizontal rail is used, the rails must be not more than 300mm apart.
- **22.** For N2 vehicles the horizontal rails must have a section height of at least 50 mm (see figure 2 A).
- **23.** For N3 vehicles the horizontal rails must have a section height of at least 100 mm (see figure 2 B).
- 24. It must have a forward facing edge of at least 100 mm.
- **25.** The side guard must be no more than 150mm inboard from the outermost plane of the vehicle.
- **26.** It must not increase the overall width of the vehicle.
- 27. The device must not be used for the attachment of air or hydraulic brake pipes.
- **28.** Where the forward edge lies in open space then the following requirements must be met (see **Note 10**):
 - a) There must be a continuous vertical member extending over the whole height of the device.
 - b) For N2 vehicles, the outer and forward faces must measure at least 50 mm rearward and be turned 100 mm inwards (see **Note 11** & figure 2 A).
 - c) For N3 vehicles, the outer and forward faces must measure at least 100 mm rearward and be turned 100 mm inwards (see **Note 11** & figure 2 B).

Method of Inspection	Required Standard
Note 7: Where items protruding less than 5mm are added to the outer surface of Lateral Protection Devices, the edges only require blunting; corners will however require a radius of at least 2.5mm in two planes.	
Note 8: Combinations of surfaces and rails shall be considered as a continuous side guard as long as the gaps between them are no greater than 25mm.	
Note 9. On a motor vehicle where the 300 mm dimension referring to the forward edge of the sideguard falls within the cab, the guard must be constructed to meet the cab panels and if necessary be turned in through an angle not exceeding 45 degrees. A longitudinal gap of 100 mm is permissible between the forward edge and the cab panels.	
Note 10 : "Open Space", is defined as a gap of more than 25mm.	
Note 11: The inward measurement is taken at 90 degrees to the longitudinal plane of the vehicle from the outer face of the guard; the actual face of the portion turned inwards may be between 90 and 45 degrees from the same plane towards the front of the vehicle.

10	10/04/2018	Add figure 5 to note 7, Add Note 10 & 11

43 Spray Suppression

Application: All Vehicles

Method of	Inspection	Required Standard
All road wheels must be fitted with	Spray Suppression devices.	Component Check
Vehicle Exemptions:		Every road wheel must be fitted with a Spray Suppression system.
Vehicle Type	Exemption Provided	2. All Spray Suppression material must be of an approved type (see
All vehicles up to 7500kg	Exemption from spray suppression but will require mud guards.	Notes 1 & 2). 3. All components must be secured so that they perform their function.
Multi wheel drive motor vehicles (capable of driving at		Installation Check
least one front axle and one rear axle)	Exemption from spray suppression but will require mud guards.	Mudguards (fitted in combination with energy absorption materials).
High ground clearance motor vehicles (>400mm)Off Road Vehicles		must fully cover the zone immediately above, ahead and behind any part of the tyre or tyres
Motor vehicles with tipper bodies – side tipping or rear tipping	Tippers are exempt from spray suppression but will require mud guards.	 in the case of non-steered wheels must have the lower front edge no more than 45 degrees above the horizontal line of the axle (A on figure 1)
Refuse vehicles including refuse collection vehicles, road sweepers, skip loaders and gulley emptiers	Exemption from spray suppression but will require mud guards.	 in the case of steered wheels must have the lower front edge no more than 45 degrees above the horizontal line of the axle (A on figure 1)
Concrete /Volumetric Mixers	Exemption from spray suppression but will require mud guards.	7. must have the lower-rear edge no more than 100mm above the horizontal line of the axle (C on figure 1).
Mudguards must comply with RS 4, 5, 6 & 7		8. must have Spray Suppression material fitted to the front face of the rear of the guard facing the tyre tread, complying with the dimensional requirements of figure 1 and 3
		Chroy Cuppropion 42

Spray Suppression 43

Method of Inspection

STGO Exempt Vehicles:

Abnormal Indivisible Load (AIL) vehicles > 2.55m (2.75m for locomotive wide) and/or > 12m long which are either Cat 2 <80T and Cat 3 <150T.

Definitions

Mudguard

Is a device to prevent as far as practical mud or water being thrown from a tyre. They may be formed using parts of the body or they may be an entirely separate unit.

Outer Valances

Are usually strips of material that are fitted longitudinally across a wheel space attached at one end to a rain flap to form an outer wheel arch lip, a vertical downward face that closes off what would be an open area.

Rain flaps

Can be a flexible extension to a mudguard or it may form the rear most vertical face of a mudguard in conjunction with the body, in this latter case it must be treated as a mudguard and be securely fixed to prevent excessive movement.

Lifting axles

Where a vehicle is fitted with one or more lifting axles, the spraysuppression system must cover all the wheels when the axle is lowered and the remaining wheels which are in contact with the ground when the axle is raised.

Self-tracking axles

Where a vehicle is fitted with a self-tracking axle, the spraysuppression system must satisfy the conditions applicable to nonsteered wheels if mounted on the pivoting part. If not mounted on that

Required Standard

9. that consist of several components must have no gaps between or within individual parts when assembled that will permit the exit of spray when the vehicle is in motion.

Additional standard where Separate Mudguards are fitted (in combination with air/water separation to multiple axle configurations).

10. Where the distance between the tyres on adjacent axles does not exceed 300 mm the mudguards must also conform to the model shown in Figure 7.

Alternative Standards from standards 4-10 where the body forms the mudguards (and energy absorption systems are fitted).

- **11.** must cover the zone above the tyre or tyres from the front edge of the tyre to the rain flap located behind the wheel see figure 5
- **12.** must have their inner faces made from or be fitted with a spray suppression material.

Outer Valances (with energy absorption Spray Suppression systems installed).

- **13.** fitted to steered and self-steered wheels must have its vertical face within 100mm of the tyre wall (**D** on figure 2) (see **Note 3**).
- **14.** fitted to non -steered wheels must have its vertical face within 75 mm of the tyre wall (**D** on figure 2) (see **Note 3**).
- **15.** must have a depth of at least 45mm, at all points behind a vertical line passing through the centre of the wheel see Figure 2.
- **16.** fitted to steered wheels must have the lower edge within 1.8 x tyre radius at points A, B and C as shown in Figure 4

Spray Suppression 43

IVA N2 / N3 Inspection Manual	Document uncontrolled when printed
Method of Inspection	Required Standard
part, it must satisfy the conditions that are applicable to steered wheels.	17. fitted to non - steered wheels must have the lower edge within 1.5 x tyre radius at points A,B and C as in Figure 4
Note 1: All spray suppression materials must be either e marked or be accompanied by an e marked sample of the material to permit the examiner to make a comparison.	18. must have no openings in them or between them and other parts of the mudguard enabling spray to emerge.
Note 2: 'Spray-suppression device' means part of the spray-suppression system, which may comprise:	Alternative standards (to 13 -18) for Outer Valances (where the body forms the mudguard over non steered or self steering wheels and a energy absorption spray suppression system is installed).
Air/water separator: This is a component forming part of the valance and/or of the rain flap through which air can pass whilst reducing pulverized water	19. must be located above each wheel of multiple axles where a rain flap is fitted between each wheel. See figure 5
emissions.	20. must have the entire inner surface fitted with an energy-absorption
or	spray-suppression material
Energy absorber: This is a component forming part of the mudguard and/or valance and/or rain flap which absorbs the energy of water spray, thus reducing	21. must be a minimum of 100mm high
pulverized water spray.	22. must have no openings in them or between the outer valance and the inner part of the mud guard enabling spray to emerge
Note 3: Where rope hooks are fitted the outer valance may meet the requirements of figure 6 as an alternative.	23. must be continuous where rain flaps are not fitted behind each wheel, they must extend between the outer edge of the rain flap and a
Note 4: The maximum height of the bottom edge of the rain flap in	vertical plane passing through the front edge of the tyre. See figure 5.
relation to the ground, may be raised to 300 mm if the manufacturer deems it technically appropriate with regard to the suspension characteristics e.g., 'road friendly' suspension.	Outer Valances (with air/water separation Spray Suppression systems installed).
	24. must have air/water separator spray-suppression devices fitted to the lower edges.
	25. must have a depth of at least 45mm, at all points behind a vertical line passing through the centre of the wheel

Spray Suppression 43

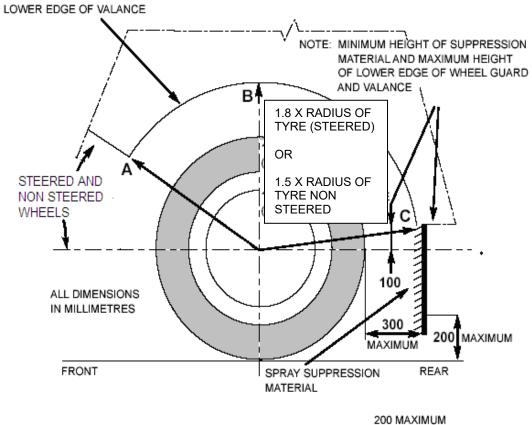

26. fitted to steered wheels must have its lowest edge within 1.05 x tyre

radius see figure 7

Method of Inspection	Required Standard
	27. fitted to non-steered wheels must have its lowest edge within 1 x tyre radius see figure 7
	28. must have no openings in them or between them and the mudguard enabling spray to emerge
	29. In the case of non steered wheels must have the lower front edge no more than 20 degrees above the horizontal line of the axle (A on figure 1)
	30. In the case of steered wheels must have the lower front edge no more than 30 degrees above the horizontal line of the axle (A on figure 1)
	Rain Flaps : (where energy absorption Spray Suppression systems are installed)
	31. must be at least equal to the full width of the tyre/s
	32. must be vertical
	33. must have the lower edge no more than 200 mm above the ground. (see Note 4)
	34. must be no more than 300 mm from a vertical plane passing through the rearmost edge of the tyre
	35. must have no openings between the rain flap and the lower edge of the wheel guard enabling spray to emerge.36. must have the whole face made of spray suppression material
	37. must be fitted to the rearmost axle of multiple axles where distance between the tyres on adjacent axles is less than 250 mm,

Method of Inspection	Required Standard
	38. must be fitted behind each wheel of multiple axles when the distance between the tyres on adjacent axles is 250 mm or greater.
	Rain Flaps: (where the body forms the mudguard and energy absorption Spray Suppression systems are installed)
	39. must extend to the lower part of the mud guard and comply with standards 29 to 36
	Rain Flaps (where air/water Separation Systems are installed)
	40. must be at least equal to the full width of the tyre/s
	41. must be vertical
	42. must have no openings between the rain flap and the lower edge of the wheel guard enabling spray to emerge
	43. must be fitted to the rearmost axle of multiple axles where distance between the tyres on adjacent axles is less than 250 mm
	44. must be fitted behind each wheel of multiple axles when the distance between the tyres on adjacent axles is 250 mm or greater
	45. must not be more than 200 mm from the rearmost edge of the tyre, measured horizontally
	46. must be at least 100 mm deep. See figure 7.

IVA N2 / N3 Inspection Manual

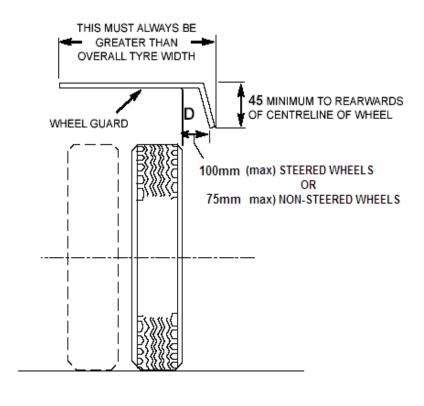

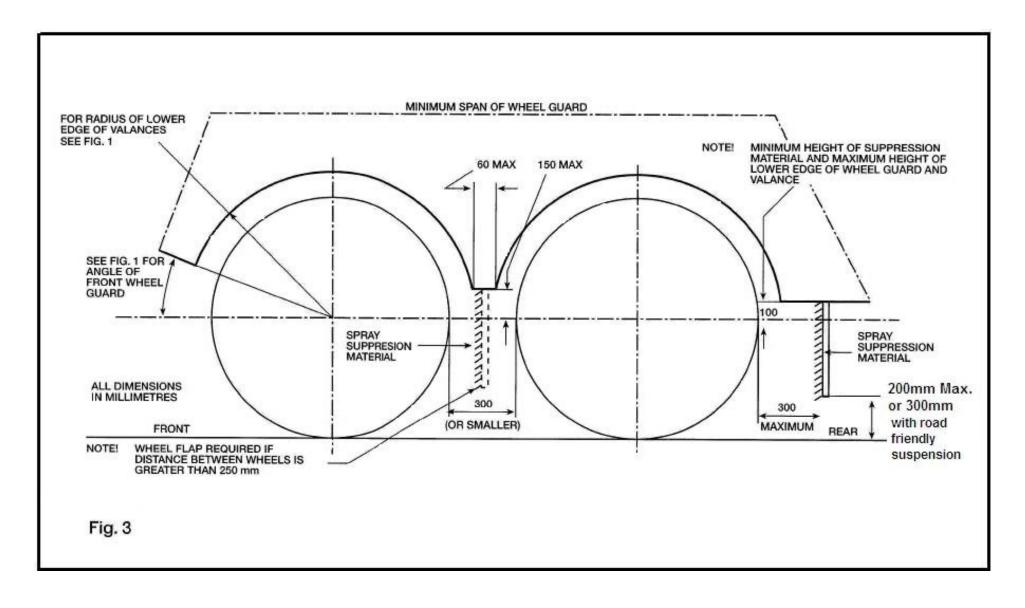

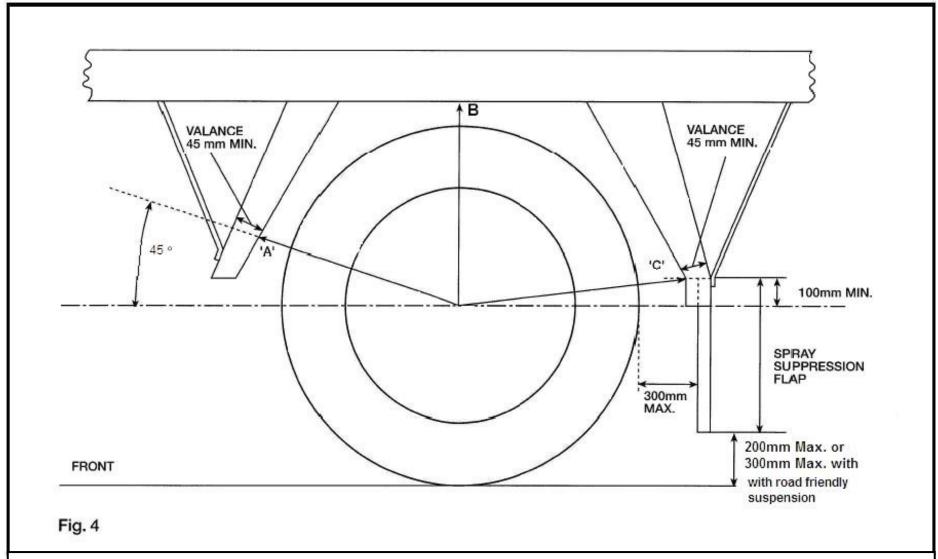

Figure 1

Figure 2

The lower edge of the outer valance shall not exceed 1.8 X tyre radius on steerable wheels, or 1.5 X tyre radius on non-steerable wheels at points A, B, & C

Spray Suppression 43

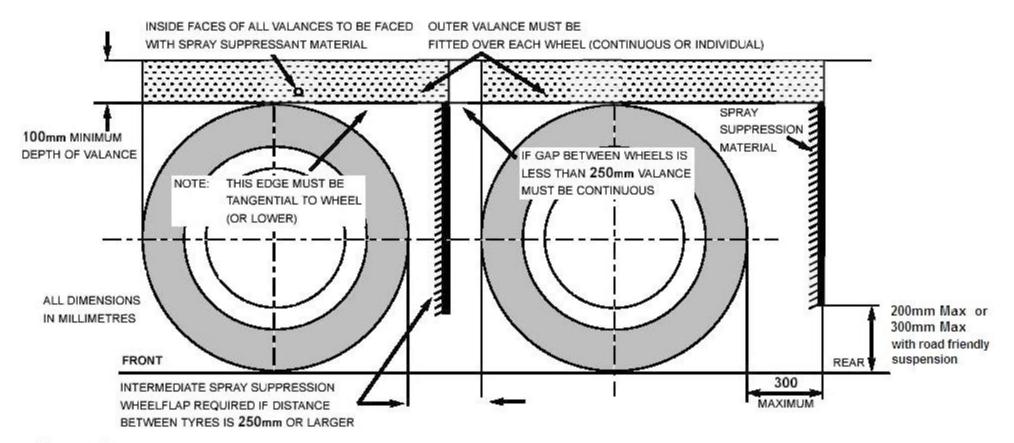

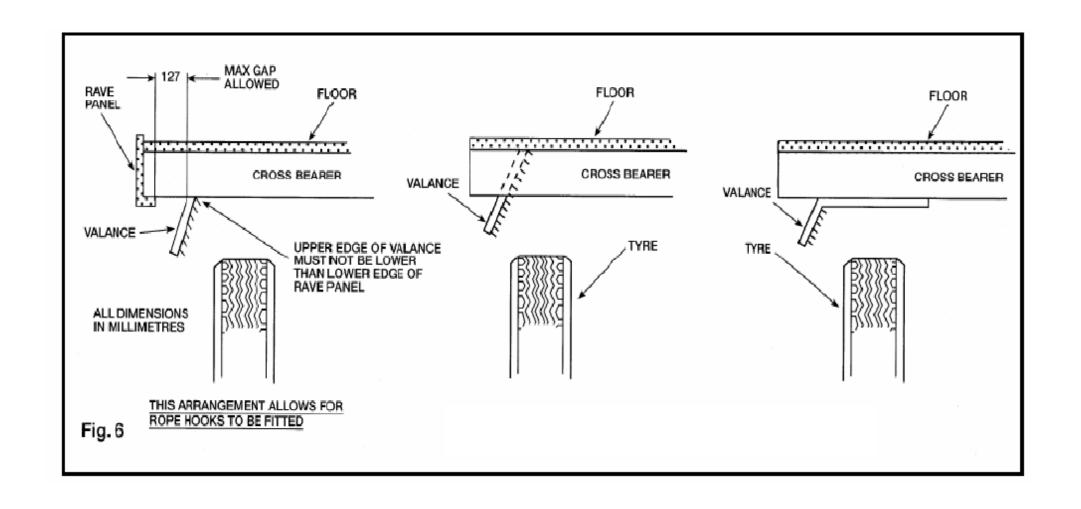

Figure 5

IVA N2 / N3 Inspection Manual

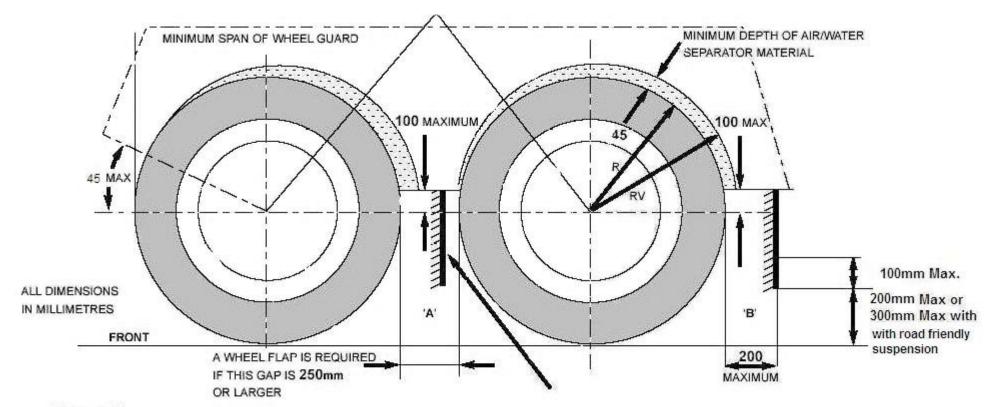

Figure 7

where:

R = the radius of tyre fitted to the vehicle;

RV = the radial distance from the lowest edge of the outer Valance to the centre of the wheel.

 $RV \leq 1.05$ on steered wheels

RV < 1.00 on non-steered wheels

Spray Suppression 43

45 Safety Glass

Application: All Vehicles (except Armoured vehicles)

Method of Inspection	Required Standard
Ensure that all windscreens, windows, internal glazed panels, and side screens are securely attached to the vehicle and are constructed from approved materials. Clear panels, not made of glass, fitted to the vehicle that do not impinge on the forward, rearward or sideward view of the driver are considered to be body panels and are not subject to the requirements of this section. The inspection of internally glazed panels applies to a partition or screen divider used for the separation of driver to passenger area or for passenger protection. It does not apply to such items like; break glass hammer panels, fire extinguisher panels or L.E.D information screens etc. This is not an exhaustive list but is provided as guidance. Note 1: "Safety Glazing" made from glass or plastic must be so constructed or treated that if fractured it does not fly into fragments likely to cause severe cuts. Each piece of glazing must display the relevant permanent marking applied by the manufacturer. Example Marking 43R Note 2: Exterior glazing must meet the requirements of Table 1 when the vehicle is in motion even when covered by shutters. Note 3: This only applies to those windows or parts of window affording the driver a view of the road.	 Windscreens, windows, internal glazed panels, and sidescreens where fitted must be securely attached to the vehicle. Windscreens, windows, internal glazed panels, and sidescreens where fitted must be suitable for use (see Table 1). Windscreens and windows wholly or partly on either side of the driver's seat must be "Safety Glazing" made from glass and display the relevant markings (see Note 1 and Table 1). All other windows (including sunroofs internal glazed panels and removable glass panels) and side-screens must be "Safety Glazing" (which may be made from glass, or from plastic) and display the relevant markings (see Notes 1 & 2 and Table 1). Windscreens and windows wholly or partly on either side of the driver's seat must allow a light transmission of at least 70% (see Note 3).

Table 1

Type of window	Relevant Markings (Mandatory) In addition to "e" approval	Markings (Not Allowed)
Windscreen	II -for ordinary laminated glassIII -for treated laminated glassIV -for glass-plastics glazing.	 V - safety glazing having a regular light transmittance less than 70 per cent. VI - double-glazed unit VII - uniformly-toughened glass which can only be used as windscreens for slow-moving vehicles which, by construction, cannot exceed 40 km/h. VIII -In the case of rigid plastic glazing.
Windows wholly or partly on either side of the driver's seat	VIII -In the case of rigid plastic glazing. In addition, the appropriate application will be signified by: /B for side, rear and roof glazing	 V -in the case of safety glazing having a regular light transmittance less than 70 per cent. VII - uniformly-toughened glass which can only be used as windscreens for slow-moving vehicles which, by construction, cannot exceed 40 km/h. VIII -In the case of rigid plastic glazing. In addition, the appropriate application will be signified by: /A for forward facing panels, /C in locations where there is little or no chance of head impact.
Other windows and other glazed panels	None	VII - uniformly-toughened glass which can only be used as windscreens for slow-moving vehicles which, by construction, cannot exceed 40 km/h.

These symbols may be marked down in a different format i.e., *II - IV*

Laminated-glass

Means a glass pane consisting of two or more layers of glass held together by one or more interlayers of plastics material; it may be:

- o "ordinary", when none of the layers of glass of which it is composed has been treated; or
- o **"treated"**, when at least one of the layers of glass of which it is composed has been specially treated to increase its mechanical strength and to condition its fragmentation after shattering;

Glass-plastics glazing

Means a pane of laminated glass having one layer of glass and one or more layers of plastics material, at least one of which acts as interlayer. The plastics layer(s) shall be on the inner face when the glazing is fitted on the vehicle;

Rigid plastic glazing

Means a plastic glazing material which does not deflect vertically more than 50 mm in the flexibility test as shown in UNECE Regulation 43

Safety Glass 45

46 Tyres

Application: All Vehicles

Method of Inspection

Check each tyre for correct fitment, structure and that it has the correct markings to confirm compliance with the required standards. (Where it is not possible to check markings, a declaration will be required from the applicant).

In the case of an **Armoured vehicle**, or **Mobile crane**, exemption from one or more of the provisions is permitted where it can be demonstrated to the satisfaction of the Approval Authority that the special purpose of the vehicle makes it impossible to fully comply.

In the case of a **Mobile crane** the provision in the above paragraph applies on condition that the requirements in ISO 10571 – 1995 (E) or ETRTO Standards Manual 1998 are fulfilled. (Satisfactory documentary evidence would be required).

Annex 1

EC Type Approval Mark

UNECE Type Approval Mark

Box should be a minimum of 12mm x 8mm

e 24 00479

Letters and numbers, minimum of 4mm high

Circle with a minimum diameter of 12mm

Number 4mm high and serial number alongside

Retreaded tyres must be approved and suitably e-marked according to UN Regulation No. 109, incorporating the manufacturers approval number as per the example below:

Required Standard

- **1.** Each tyre fitted to the vehicle, including any spare or temporary use spare, must have the correct approval marks (Annex 1).
- 2. The tyre must also be marked with the following information:

 Manufacturer's name or trade mark, tyre size designation, category of use (as appropriate), speed category, load capacity index and tyre cross section (see **Note 1**).
- **3.** Each of the tyres fitted to a vehicle, must have the same structure (see **Note 2**).
- **4.** Each of the tyres fitted to any one axle must be of the same type (see **Note 3**).
- **5.** Each tyre must have the correct load indices, speed ratings and use markings, taking into account the vehicle to which it is fitted, and the type of use i.e., load and speeds the vehicle will be subject to (see **Notes 1, 2, 3, 4, 5 & 6** and tables 1, 2, 3 & 4).
- **6.** Each wheel and tyre must have sufficient room to revolve so as to ensure that it is unlikely to foul on any part, taking into consideration the suspension and steering constraints provided by the manufacturer.
- **7.** Tyres must be fitted in accordance with the manufacturer's instructions as indicated on the side wall of the tyre.
- **8.** The grooves of the tread pattern must be at least 1mm in depth through a continuous band comprising of at least ¾ of the original breadth of the tread pattern (excluding wear indicators).

Method of Inspection	Required Standard
UNECE Type Approval mark	
· LE 4	
109 R - 002439 🗘 №	
a=12mm minimum	
Note 1: Tyres with no category of use designation (special, snow tyre etc), will be deemed to be Normal Use Tyres.	
Note 2: Structure means the technical characteristics of the tyre's carcass, such as diagonal or bias ply, bias belted, Radial, reinforced.	
Note 3: Type of tyre means tyres which do not differ in such essential respects as manufacturer's name or trade mark, tyre size designation, category of use (special, snow tyre etc), speed category, load capacity index and tyre cross section. Nb. When dealing with an age related IVA and imported used vehicles "manufacturers name or trade mark" does not apply in the above definition.	
Note 4: Operators may display a 50mph sticker on the rear of their vehicle, they must have documentary evidence to claim the vehicle is one with a restricted speed.	
Note 5: Vehicles running under STGO can be fitted with tyres showing a lower maximum load as running speeds will be reduced, see Table 4.	
Note 6 As an alternative to rejecting a vehicle for a tyre of inadequate load capacity the applicant may choose to reduce the GB weights to that of the tyre capacity. (The examiner must also ensure that the DVSA technical record is correct).	

Table 1

The Minimum required speed ratings are:

Class of Vehicle	Permitted Speed MPH	Minimum Speed Symbol Required
Rigid goods vehicles with a maximum laden weight not exceeding 7.5 tonnes	70	L
Rigid goods vehicles with a maximum laden weight exceeding 7.5 tonnes	60	J
Articulated vehicles	60	J
Goods vehicles operating under 2J or 2M tyre use conditions	40	D
Restricted speed vehicles operating under 2R tyre use conditions	50	F

Table 2

Alternative Speed Ratings

Certain vehicles can be fitted with tyres showing a lower speed rating than those shown above but the maximum axle loads will be reduced as shown below.

Class of Vehicle	Normal Speed Rating	Alternative Speed Rating	Reduction in Axle Load
Motor vehicles not		J	7 %
exceeding 7500kg plated weight	L	К	3 %

Revision: 6 Date: 10/04/2018 2 of 2

48A Masses and Dimensions

Application: Normal dimensions, C&U or dual plated (C&U/STGO) vehicles.

Method of Inspection

This inspection is to ensure that the vehicle as presented has satisfactory evidence of compliance to the required standard and has not been subject to modifications that may invalidate any approval held.

In most cases a vehicle/trailer submitted for test will be unladen and will be obviously well within the permissible GB weights set out in the Maximum Permitted Weight Annex.

However, if it seems likely that the vehicle/trailer or an axle (as presented) may exceed any of these weights, either weigh the vehicle/trailer or request a weight ticket.

STGO:

Vehicles complying with the Road Vehicles (Authorisation of Special Types)(General) Order 2003 or the Motor Vehicles (Authorisation of Special Types) Order (Northern Ireland) 1997 are exempt from any of the standards which they are unable to comply with due to their special purpose.

Plating:

A Plating examination under the Goods Vehicle (Plating and Testing) Regulations 1988 must be carried out during the IVA examination unless the vehicle is exempt (as in Schedule 2 of those regulations). An IVA test pass result confirms that the provisional weights allocated on the DVSA technical record are correct. In the case of vehicles exempted from the "Plating" or intended for registration in Northern Ireland the statutory plate prescribed in Section 18 of this manual must have two columns,

Required Standard

Dimensions:

1. The vehicle must not exceed the maximum authorised dimensions for width and length. (see **Notes 1, 3, 4, 5** and Annex 1).

Category	WIDTH (see Annex 1)	LENGTH (see Annex 1)
N2	2550mm #	12000mm
N3	2550mm #	12000mm

2600mm for the superstructure of vehicles designed for transport of goods under controlled temperatures with or without equipment to maintain the interior temperature

Masses:

- 2. In the case of a vehicle subject to Plating, the vehicle or axle weights (as presented) must not exceed the maximums authorised for the Plating certificate.
- **3.** In the case of a vehicle not subject to Plating, the vehicle or axle weights (as presented) must not exceed the maximums marked on the Statutory Plate prescribed in section 18 of this manual.
- **4.** Where the Maximum permissible trailer towing weight exceeds 3500kg or the vehicle is equipped to tow a semi-trailer, it must be verified that the vehicle has a facility to operate power brakes on the trailer.

Masses and Dimensions 48A

Revision: 11 Date: 20/10/2023 1 of 12

Method of Inspection

one for maximum GB/NI weights, which must align to the requirements of Annex 2 of this section and one for technically permissible (design) weights if they are higher.

Dimensions:

Check that the vehicle does not exceed the maximum authorised dimensions given in the table in Standard 1.

Masses:

Check the requested/regulated GB weights, where they are different to the Design Weights two columns are required on the manufacturers plate.

Non Ministry plated vehicles must show two columns on the manufacture's plate.

Draft Ministry plated vehicles should be checked for two columns where applicable.

Turning Circle Requirements:

Check that the vehicle is able to manoeuvre a complete circular trajectory of 360 degrees inside an area defined by two concentric circles, without any of the vehicles outermost points projecting outside the circumferences of the circles (See figure 1). This must be completed on both steering locks.

The outer circle having a radius of 12.50 metres.

The inner circle having a radius of 5.30 metres.

When the vehicle is stationary facing the circle establish a vertical plane and mark this on the ground alongside the vehicle (see figure 2).

Required Standard

Installation of retractable or loadable axles:

5. If a vehicle is fitted with one or more loadable axles, satisfactory evidence must be provided stating that under all driving conditions, the axle will lower to the ground automatically when the front axle or the nearest axle of a group of axles is loaded.

Turning Circle Requirements (see Note 2)

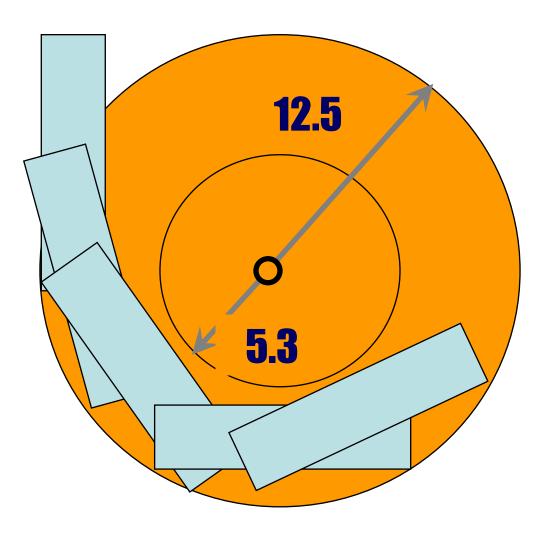

- **6.** The motor vehicle must be able to manoeuvre for a complete circular trajectory of 360 degrees within the defined area (with the exception of the protruding parts prescribed for the vehicle width shown in Annex 1) (See figure 1).
- 7. Any part of the vehicle must not move outside of the vertical plane by more than 0.8 metres. For vehicles with retractable axles in the lifted position, or loadable axles in the un-laden condition, the figure of 0,80 m is replaced by 1,00 m.
 (For vehicles with an axle-lift device this requirement should be
 - (For vehicles with an axle-lift device this requirement should be checked to both requirements shown above applies with the axle(s) in the running and lifted positions) (See figure 2).

Masses and Dimensions 48A

Method of Inspection	Required Standard
When the vehicle enters the circle as described above no part of it shall move outside of this by prescribed limits in required standard 7. This procedure must be carried out on both sides.	
Note 1: Where the vehicle is clearly within the maximum, a measurement is not needed.	
Note 2: Turning Circle Requirements need not be met by vehicles with four or more axles where the distance between the foremost and rearmost axles exceeds 6.4 metres.	
Note 3: Safety railings mounted on a vehicle designed to carry at least two other wheeled vehicles are to be excluded, provided that the safety railings are more than 2m above the ground and the overall width including safety railings does not exceed 2.70m.	
Note 4: Devices for securing the tarpaulin and their projection not projecting by more than 20mm where they are no more than 2.0m from the ground level and no more than 50mm where they are more than 2.0m from the ground level. The edges shall be rounded to a radius of not less than 2.5mm.	
Note 5: Vehicles fitted with Elongated Cabs where the overall length exceeds 12m:	
 The loading area length behind the cab shall be a maximum of 10.5m. The vehicle must be marked with 96/53/EC ARTICLE 9A COMPLIANT or C&U REGULATION 7(3D) COMPLIANT on the vehicle manufacturers statutory plate. 	

Figure 1

Vehicle must remain in between the 2 circles for a full 360 deg.

	*	points)		
Two-axle rigid	18000 kg	19000 kg	20000 kg	6000
Three-axle rigid	25000 kg	26000 kg (see Note 1)	27000 kg (see Note 1)	5500
Three axle rigid (complying with Note 2)	26000 kg	27000 kg (see Note 1)	28000 kg (see Note 1)	5500
Four or more axle rigid	30000 kgs	N/A	N/A	5000
Four or more axle rigid (complying with Note 2)	32000 kg	N/A	N/A	5000
Two-axle tractor unit	18000 kg	19000 kg (see Note 1) #	20000 kg (see Note 1) #	6000
Three or more axle tractor unit	25000 kg	26000 kg (see Note 1)	27000 kg (see Note 1)	6000
Three or more axle tractor unit (complying with Note 2)	26000 kg	27000 kg (see Note 1)	28000 kg (see Note 1)	6000

Note 1 The figure for Alternative fuel and Zero emission vehicles can be increased above the figure in column 5, **up to** the maximum specified in column 6 and 7; by a figure equal to the increase in unladen mass compared to a conventional powertrain. For example, the added mass of a battery and electric motor for a hybrid, or the increase in mass for a CNG or hydrogen tank compared to the mass of a diesel tank. The payload cannot be increased. Written evidence of the additional mass for the alternative propulsion from the manufacturer is required.

Note 2 Where the driving axle is not a steering axle and is fitted with twin tyres and air suspension or suspension recognised as being equivalent, **or** where each driving axle is fitted with twin tyres and the maximum weight of each axle does not exceed 9.5 tonnes.

Due to design weight limitations, there are circumstances where the Gross Train Weight (GTW) can be increased on two-axle tractor units, where the design GTW allows.

PLEASE NOTE: If the vehicle axle configuration is not listed above please contact Ellipse Technical Section for advice on the weights applicable.

Masses and Dimensions 48A

49 Exterior Projections of Cabs

Application: All Vehicles

Method of Ins	spection
---------------	----------

The cab area of Vehicles must not display any features likely to increase the risk of injury to other road users. This section does not apply to mirrors, their supports, or accessories such as aerials and luggage racks.

In the case of unmodified Mass-Produced vehicles (cabs) the standards in this section shall be considered to be met.

In considering if an item meets the requirements of this section, the examiner will compare the materials and methods used to those employed by a Major Vehicle manufacturer or to examples found on Approved vehicles. Items such as covers (rubber or otherwise) that are held in place by being stretched on or attached by double sided tape or other inadequate means, rubber hosing, pipe lagging etc. are not considered acceptable methods or materials. This is not an exhaustive list but provided as guidance as to the type of item considered to be un acceptable.

In the case of an **Armoured vehicle**, exemption from one or more of the requirements is permitted where it can be demonstrated to the satisfaction of the Approval Authority that the special purpose of the vehicle makes it impossible to fully comply.

Exterior projections will be assessed between the 'floor line' and a height of 2 metres from the ground extending rearwards to a plane passing across the rear of the cab (see note 1) and includes damaged, modified, or repaired bodywork. The theoretical floor line is determined by the series of contact points formed between the vehicle and the application of a curved area of a cone segment. The curved

Required Standard

- 1. A mascot, emblem or other ornamental object must retract or detach when a reasonable force is applied and leave a base or mounting free from sharp edges that does not protrude from the surface by more than 10mm.
- 2. All 'hard' parts contactable with a 100mm sphere, which form an external surface or protrude 5mm or more from the external surface must have a radius of curvature of at least 2.5mm. (see **Notes 1, 2, 3, 4, 5, 6, & 7**).

The criteria of Standard 2 DOES NOT apply to the following, which must be checked to their individual requirements:

- **3.** Protrusions less than 5mm contactable with a 100mm sphere must have blunted edges (see **Notes 1 & 2**).
- **4.** Wheel arches must be 'turned inwards' or have a radius of curvature of at least 2.5mm.
- **5.** The edges of running boards and steps must be rounded (the top surface of the step is exempt).
- **6.** Grills, gaps, slots, grooves, channels, recesses, and holes that have a width of 10mm or less as determined by the contact points of a 100mm sphere must be blunted (see **Note 8**).

Exterior Projections of Cabs 49

Revision 7 Date: 10/04/2018 1 of 6

Method of Inspection

area is at an angle of 30 degrees from the vertical. The points of contact are used as a guide to judge the actual floor line. I.e., Certain items that the cone contacts are likely to move or offer little resistance prior to detaching and are therefore excluded from the actual floor line. In addition, where the cone contacts 2 or more points and cannot contact other items that may determine the floor line a judgement will be made as to where the cone would contact the other items. Jacking points, exhaust pipes (**only** where the tail pipe protrudes from under the body – side mounted exhausts may actually provide the points of contact that form the floor line) and wheels are not taken into consideration when the floor line is being determined. Wheel arches are assumed to be filled in exempting any projection inboard of the turned in edge of the wheel arch. **Note** the floor line its self is subject to the requirements of RS2 i.e., the 2.5mm radius requirement applies.

'Radius' refers to the external radius of curvature.

'Blunted edges' are those which under finger and thumb pressure alone would not be likely to cut the skin.

"Cab rear panel" means the rearmost transverse panel of the external surface of the driver and passenger compartment. Where it is not possible to determine the position of the cab rear panel it would be deemed to be the vertical transversal plane situated 50 cm to the rear of the R point of the driver's seat, with the driver's seat, if adjustable, located at its rearmost driving position. If the cab is fitted with more than one row of seats, the rearmost passenger seat in its rearmost position has to be taken into account for the definition of the rear cab panel. The rear panel is excluded from the requirements of this section.

The IVA test plate (referred to in Section 4 Rear Registration Plate Space) will be placed on any number plate mountings provided. This will allow the area around the plate and its mountings to be assessed correctly.

Required Standard

- 7. Grills, gaps, slots, grooves, channels, recesses, and holes which have a width of more than 10mm, and up to 25mm determined by the contact points of a 100mm sphere must be blunted (see **Note 8**).
- **8.** Grills, gaps, slots, grooves, channels, recesses, and holes which have a width of more than 25mm, and up to 40mm determined by the contact points of a 100mm sphere must have a radius of curvature of at least 1mm (see **Note 8**).
- 9. Grills, gaps, slots, grooves, channels, recesses, and holes which have a width of more than 40mm determined by the contact points of a 100mm sphere must have a radius of curvature of at least 2.5mm (see Note 8).
- **10.** Where contactable with the 100mm sphere sheet metal edges must be folded back on themselves (180 degrees).
- **11.** Where contactable with the 100mm sphere a glass/fibre reinforced plastic panel edge must have a radius of curvature of at least 1.5mm.
- **12.** Wiper blades and their support arms must be at least blunted.
- **13.** Wheel nuts, hub caps and protective devices must not exhibit any finshaped projections.
- **14.** Protective device(s) with a radius of curvature of at least 5mm must be fitted to wheel securing bolts, nuts, or hubs if they protrude beyond the upper half of the tyre surface. The protective devices which cover wheel nuts and hubs may project beyond the body plan by no more than 30 mm.
- **15.** The upper half of a wheel must not protrude beyond the cab body plan form (disregarding tyres).

Exterior Projections of Cabs 49

Method of Inspection

Note 1: The measurement of a protrusion is taken from the "external surface". The external surface is the first surface that the 100mm sphere can contact nearest to the protrusion in question. Where the sphere does not touch a surface (possibly due to the length of the projection) or contacts a further projection, a simple measurement from the projections mounting surface will be made.

- **Note 2:** For grab handles the projection is measured in relation to a plane passing through the points of attachment.
- **Note 3:** A 'hard' feature is a feature which has a hardness of at least 60 Shore A (as a guide, deemed to be harder than the average pencil eraser).
- **Note 4:** This does not apply to the couplings fitted to Abnormal Indivisible Load Vehicles (**STGO**), and which need only to be blunted.
- **Note 5:** Landing / Stabiliser Legs fitted within the cab area are not subject to the radial requirements of this section, they need only to be blunted.
- **Note 6:** Safety cameras fitted to vehicles for the protection of unprotected road users will not be subject to the 2.5mm radius requirements they only need to be blunted, protective shields /guards fitted for these devices are still subject to the normal criteria of the section.
- **Note 7:** This does not apply to the heavy duty installation brackets/components for the fitting of specialist equipment i.e., snowplough blade which only need to be blunted.
- **Note 8:** The distance between parts of a grille is the distance between two planes passing through the points of contact of the sphere and perpendicular to the line joining the points of contact.

Required Standard

- **16.** The edges on lateral air and rain deflectors and window anti-smear air deflectors, capable of being directed outwards must have a radius of curvature of not less than 1 mm.
- **17.** The ends of front protective devices (bumpers) must be turned inwards towards the external surface of the body.
- **18.** The components of bumpers projecting 5mm or more must be so designed that all rigid surfaces facing outwards have a radius of curvature of not less than 5 mm. The edges of devices projecting less than 5 mm must be blunted.

The following Standards must be met IN ADDITION to Standard 2:

- **19.** Equipment such as towing hitches and winches must not protrude beyond the foremost surface of the bumper. However, winches may protrude beyond the foremost surface of the bumper provided they are covered when not in use by a suitable protective covering having a radius of curvature of not less than 2.5 mm (see **Note 4**).
- 20. Push buttons must not protrude more than 30mm (see Note 9).
- **21.** Handles (other than grab handles), hinges, and fuel tank filler caps must not protrude more than 50mm.
- **22.** Grab handles and bonnet fasteners must not project more than 70mm.
- **23.** Headlight visors and rims must not project more than 30mm beyond the lens surface (measured horizontally from the point of contact of a 100mm sphere touching lens and visor/rim or the adjacent bodywork and the visor/rim if the lamp is recessed).

Exterior Projections of Cabs 49

Method of Inspection	Required Standard
Note 9: This does not apply to Emergency Stop Buttons used by auxiliary equipment fitted to the vehicle.	24. Handles that rotate or pivot outwards must be enclosed in a protective surround or be recessed unless they cannot in any circumstance project beyond the extreme outer edge of the cab.
	25. Handles that rotate parallel to the plane of the panel must be turned inwards towards the plane of the panel.
	26. The open end of any handle that rotates parallel to the plane of the panel and protrudes beyond the extreme outer edge of the cab must face rearwards.
	 27. Any handle that does not protrude beyond the extreme outer edge of the cab must have: a. The open end facing rearwards, or b. the open end shielded to the front by a protective surround, or c. the open end recessed into the bodywork, or d. a gap measuring a maximum of 2mm between the open end of the handle and the vehicle body.
	28. Handles that pivot outwards must have the open end facing rearwards or downwards unless they have an independent return mechanism which in event of failure will not allow the handle to project more than 15mm.
	29. An exhaust tailpipe must not project beyond the floor line or the vertical projection of the intersection of the reference plane with the external surface of the vehicle lying directly above it by more than 10mm unless it terminates in a radius of curvature of at least 2.5mm.

50 Couplings

Application: All Vehicles (where fitted)

Method of Inspection	Required Standard
Every coupling device-must be accompanied by installation and operating instructions to ensure it is correctly installed and can be operated safely. This inspection process checks for the correct 'e' or "E" markings.	All Couplings I. If a coupling device is fitted then the vehicle must be provided with a Gross Train Weight, which must satisfy the requirements of Section 48 (masses & dimensions).
An assessment must be made of the coupling load bearing structure to which the device is attached to ensure it and any fixings are of sufficient strength. This may be by either: • approval relevant to the vehicle, or	 The coupling load bearing structure, to which the coupling is attached, and/or any fixings used, must be of sufficient strength and in accordance with the relevant approval.
visual examination and assessment of the surrounding area and fixings.	 The coupling devices must be of an approved type and have the correct markings (see Notes 1 & 2).
Only automatic coupling devices (which allow an automatic coupling procedure on motor vehicles) are permitted for the coupling of	4. The coupling must display its load capacity.
trailers having a maximum mass of more than 3.5 tonnes.	5. The coupling must be of sufficient capacity (see Note 3).
Compliance may be demonstrated by: • A vehicle approval; or • A vehicle test report; or	The chassis and coupling manufacturer's installation / operating instructions must be presented with the vehicle.
An installation check	7. The coupling must be installed in accordance with the instructions provided, paying particular attention to:
Note 1: Where the relevant "e" or "E" markings are not visible due to the installation method, the presenter may provide evidence that the coupling used is appropriately marked,	a. The number and grade of securing bolts required
	b. Whether any reinforcement of the fixing area is required
Note 2: STGO - Abnormal Indivisible Load Vehicles (GTW of at least 120,000kg), the couplings are not required to be 'e' or 'E' marked	There must be sufficient free space around the coupling to enable the coupling to operate safely when a trailer is attached.

Couplings 50

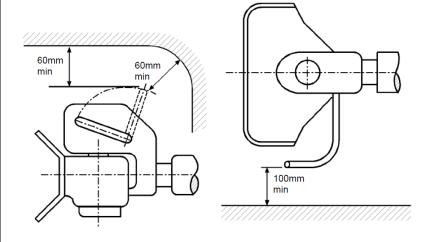

Method of Inspection

Note 3: Other than in the case of a 50mm ball coupling, the coupling must be of sufficient strength/rating to attach a trailer relevant to the displayed design train weight on the vehicle.

Note 4: If one or more of the following standards regarding easy and safe operation (RS8/9), accessibility (RS11) or clearance for the hand lever (RS10) cannot be met; a coupling with a remote control device must be used. Evidence of compliance with Directive 94/20/EC or Regulation 55:01 will be required.

Note 5: If it is mounted in this area, then a coupling ball that can be dismantled without special tools has to be used.

Figure 1

Required Standard

Draw bar couplings

- **9.** A drawbar coupling must have a safe area in which a person can operate the coupling, this area must be free from any points of possible danger, any sharp edges or corners must be protected so that injury is unlikely (see **Note 4**).
- **10.** The way of escape from the coupling area for draw bar couplings must be free from restriction and not be barred on either side by any attached objects (see **Note 4**).
- **11.** A manually operated draw bar coupling must have sufficient clearance for the hand lever to operate easily (see **Note 4** and figure 1).
- **12.** The distance from the centre of the coupling pin to the rear of the bodywork must not exceed 420mm except: (see **Note 4**)
 - a. providing the easy and safe actuation of the drawbar coupling is not adversely affected, this distance may be extended up to 650mm for vehicles with tipping bodies or rear mounted equipment
 - **b.** or up to 1320 mm if the unobstructed height is at least 1150mm.
 - **c.** Car transporters with at least two loading levels when the trailer / vehicle is not separated during normal operation may have the coupling set further back than the 420mm.
- **13.** A remote control device must be accompanied by satisfactory evidence of compliance (see **Note 4**).

50 mm Ball couplings

14. Where a 50mm ball coupling is fitted the ball must not be mounted so as to obscure the place or visibility of the rear licence plate (See **Note 5**).

57 Front Under Run

Application: All Vehicles

Method of Inspection	Required Standard
Ensure that the vehicle has approved / tested front under-run protection, this may be in the form of a separate front under run device or be part of the normal structure at the front of the vehicle.	The device must be accompanied by satisfactory evidence of compliance with the required standard for "Front Under Run Protection" (see Note 1).
For vehicles having a separate front under run device ensure that an approved device is fitted and that it complies to the installation requirements found in standards 2 – 7.	Installation Check2. The device must be attached securely to the front of the
	vehicle.
Vehicle Exemptions	3. The device must have a ground elegrance not exceeding 400
Highways surface / Geographic survey vehicles where specialist equipment prevents the fitting of devices.	The device must have a ground clearance not exceeding 400 mm.
Vehicles (including Off-Road and STGO) where fitment would not be compatible with their use.	4. The device must not extend beyond the width of the front axle (measured at the outermost part of the tyres excluding the bulging of the tyres close to the ground):
Road Recovery Vehicles where extra ballast is fitted behind the front bumper.	The device must be no shorter than the width of the front axle by more than 100 mm on either side (measured at the
Note 1: For vehicles of category N2 not exceeding 7.5t maximum mass as an alternative to satisfactory documentary evidence, can meet the requirements for front under run protection if:	outermost part of the tyres excluding the bulging of the tyres close to the ground):
Herit diraci fair protection in	6. The device must be no shorter than the outermost point of the
 The ground clearance at the front of the vehicle does not exceed 400mm between two points set at not more than 200mm inwards from the outer edge of the front tyre on each side; 	•
and	7. The device must not be bent to meet the requirements of RS 5
 Outside these points the height may increase towards the outside of the vehicle at an angle of not more than 15 degrees from the horizontal. 	or 6.

62 Hydrogen Powered Motor Vehicles

Application: All Vehicles powered by hydrogen

For the information of applicants only

For the required standards for hydrogen fuelled vehicles please refer to Section 03A Fuel Tanks.

Hydrogen powered vehicles can be either internal combustion engine, with hydrogen fuel burnt in a similar way to petrol, or they can be hydrogen fuel cell, where hydrogen is converted to electricity in a chemical reaction, and the electricity powers the vehicle via an electric motor. The hydrogen can be stored (under high pressure) in compressed gas or liquefied form.

Method of Inspection

Confirm that the vehicle is a Hydrogen powered vehicle, by noting the presence of a Hydrogen fuel tank, and in the case of hydrogen fuel cell vehicle, the fuel cell and electric motor.

3	20/10/2023	Section renamed to match RV(A)R 2020, application clarified, reference to glossary added to MOI. Removal of RS3 & re-numbering of remaining RS. TSE IVA N2N3 069 001

Revision: 3 Date: 20/10/2023 2 of 2

General Construction

Application: All Vehicles subject to IVA requirements

Method of Inspection

The following section assesses the vehicles suitability for use under all normal operating conditions, including when it is laden to its maximum permitted axle/gross vehicle weight and considers the effects of vibrations and the forces imposed by its design speed, acceleration characteristics, braking and cornering. The vehicle must at all times present no danger to the occupants or other road users.

All components and attachment methods will be compared to those employed on ECWVTA vehicles. This does not prevent a manufacturer utilising other construction methods or materials providing they offer at least the equivalent performance of those employed on an approved vehicles.

Note 1: A television monitor which can be seen from the driving position and capable of operation when the vehicle is in motion is not acceptable, unless it provides visibility to the rear of the vehicle, a navigation map, vehicle specific information or a combination of these items.

Note 2 This assessment includes the attachment of any component/assembly of any structure, the strength and suitability of materials used, (including pipes etc.), all fastenings, (welding, brazing, bonding, rivets, nuts, and bolts etc.) are to be assessed for suitability, completeness, and security.

Note 3 When assessing a component for leaks the original design of the component will be taken into consideration.

Required Standard

- 1. All aspects of the design and construction of the vehicle must be such that no Immediate danger is caused or likely to be caused to any person in the vehicle or to other road users (see **Note 1**).
- **2.** When driven, the safe control of the vehicle must not be impaired or likely to be impaired, due to a design or construction feature or characteristic.
- **3.** The vehicle structure and all components including their attachment must be suitable and of adequate strength (see **Note 2**).
- **4.** A transmission/braking component which rotates during vehicle operation, electrical component, steering or suspension component, wheel or tyre must not foul on another component, or be likely to foul under normal operating conditions.
- **5.** Fuel and electrical components must not be subject to either a corrosive environment or be exposed to heat sources likely to cause premature failure.
- **6.** All steering, suspension, brake, and fuel system components must not be leaking (see **Note 3**).
- 7. All electrical cables/wires must be free from chaffing and secured at intervals of at least every 300mm unless contained in a secure hollow component (see Note 4).
- **8.** All electrical components must be secure, be of adequate capacity, and be insulated as required as to prevent short circuiting during operation.

General Construction

This page intentionally left blank

General Construction

Glossary of Terms

Abnormal Indivisible Load vehicle

A vehicle specially designed and constructed, and used only for, or empty in connection with, the conveyance of abnormal indivisible loads.

Air Bag

A flexible bag fitted to a vehicle designed to be filled with gas under pressure in order to protect the driver or front seat passenger in the event of a collision involving the front of the vehicle.

Alternative Fuel

A fuel or power source which serves, at least partly, as a substitute for fossil oil sources in the energy supply to transport and which has the potential to contribute to its de-carbonisation and enhance the environmental performance of the transport sector, consisting of—

- (a) electricity consumed in all types of electric vehicles;
- (b) hydrogen;
- (c) natural gas, including biomethane, in gaseous form and liquefied form;
- (d) liquefied petroleum gas;
- (e) mechanical energy from on-board sources, including waste heat;

Alternatively Fueled Vehicle

A motor vehicle powered wholly or in part by an alternative fuel and which has been approved under the "Framework Directive."

Armoured Vehicle

A vehicle intended for the protection of conveyed passengers and/or goods and complying with armour plating anti-bullet requirements.

"Anti-bullet requirements" shall be interpreted as meaning; the driver and passenger compartment (front, rear and sides including doors and glazing are capable of withstanding ballistic penetration from small arms fire. e.g. materials to EN 1063 or an equivalent level of protection.

Approval Authority

The Vehicle Certification Agency are the UK Approval Authority,

Auxiliary engine

An engine not used to propel the vehicle but to drive engineering plant equipment on the vehicle.

Blunted Edge

An edge not likely to cause injury whatever the circumstances under finger/thumb pressure (contact is not likely to puncture the skin).

Cab Plan Form

The area resulting from the vertical projection of the front and sides of the cab area only onto a horizontal surface. For the purposes of this definition "cab area" means all parts of the bodywork and chassis, of the cab only, including any separate wheel guards but not including running gear such as wheels, axles, suspension, brakes, and steering.

CNG

Compressed Natural Gas.

Coupling Class

Class A = Coupling balls and towing brackets

Class B = Coupling heads

Class C = Automatic drawbar couplings

Class D = Drawbar eyes Class G = Fifth wheel Couplings Class H = Fifth wheel pin

Class S = Devices and components which do not conform to any of the Classes A to H above and which are used, for example, for special heavy transport or are devices unique to some countries and covered by existing national standards.

Date of Manufacture

In the case of an Amateur Built Vehicle is, unless otherwise stated in the regulations or Inspection Manual:

- the date on which the vehicle is presented for examination; or
- a date prior to the date the vehicle is presented for examination if there is conclusive evidence the vehicle was completed and included all the parts which it needs to comply with the prescribed requirements and was in such a condition as to be acceptable to test on that date.

Designated Seating Position

A position where there is a seat designated for normal use while the vehicle is travelling on the road.

Disabled Person's Belt

A seat belt which has been specifically designed or adapted for use by an adult or young person suffering from some physical defect or disability and which is intended for use solely by such a person.

Double Glazing

An assembly of two glazing panes permanently assembled in manufacture and separated by a uniform gap.

Double Windows

Two separate units installed in a vehicle as separate inner and outer panes.

Emergency vehicle

An **emergency vehicle** is any vehicle that is designated and authorized to respond to an <u>emergency</u> in a life-threatening situation. These vehicles are usually operated by designated agencies, often part of the government, but also run by charities, non-governmental organisations and some commercial companies.

Extreme outer edge

In relation to the side of a vehicle, the vertical plane parallel with the longitudinal axis of the vehicle and coinciding with its lateral outer edge, disregard the projection of;

- a. distortion of any tyre due to the weight of the vehicle
- b. connections for tyre pressure gauges
- c. anti-skid devices mounted on the wheels
- d. rear view mirrors
- e. lamps and reflectors
- f. custom seals and devices for securing and protecting such seals
- g. special equipment (as listed in Annex 1 section 48)
- h. in respect of Section 49 (Exterior Projections) only: windows, handles, hinges, push buttons and fuel tank filler caps.

Front under-run protection

Means the presence at the front of the vehicle of either:

A special front under-run protection device; or

Body work, chassis parts or other components, such that by virtue of their shape and characteristics, these elements can be regarded as fulfilling the function of the front under-run protection device.

Forward control vehicle

A vehicle with the configuration in which more than half of the engine length is rearward of the foremost point of the windshield base and the steering wheel hub in the forward quarter of the vehicle length.

Harness Belt

Means an adult belt which is a harness belt compromising a lap belt and shoulder straps.

Indivisible load

Shall mean a load that cannot, for the purpose of carriage by road, be divided into two or more loads without undue expense or risk of damage.

Hard Parts

Parts made of a material of hardness exceeding 60 shore A.

Hybrid Electric Vehicle (HEV)

A vehicle, including vehicles which draw energy from a consumable fuel only for the purpose of recharging the electrical energy/power storage device that for the purpose of mechanical propulsion draws energy from both of the following on-vehicle sources of stored energy/power:

- (a) A consumable fuel;
- (b) A battery, capacitor, flywheel/generator, or other electrical energy/power storage device.

In Running Order

In relation to the vehicle weight, means

- with all fluids (such as oils and engine coolant) necessary for the vehicle to be driven, the fuel tanks full, a spare wheel and tool kit
- carrying a driver weighing 75kg but no other passenger or load.

Illuminating Surface

Should be taken to be the area of the "reflector" to the rear of the bulbs. Where lamps are mounted in a common housing and are "E" marked, the separation criteria should be assumed to be met.

Insecure

A component or its fixing is, due to its design or a construction feature, not completely attached to the vehicle structure or to another associated component as intended.

Lap Belt

A seat belt which passes across the front of the wearer's pelvic region, and which is designed for use by an adult.

Lifting Axle

'Lifting axle' means an axle which can be lifted from the road during normal trailer use.

Locomotive

Vehicles not constructed or adapted to carry a load or passengers except water/fuel/batteries/tools. Light locomotive 7370 – 11690kg. Heavy locomotive exceeding 11690kg, e.g., Mobile cranes, fixed plant or agricultural.

Longitudinal Plane

A vertical plane parallel to the longitudinal axis of the vehicle.

LPG

Liquid Petroleum Gas.

Major Manufacturer

A vehicle manufacturer that produces vehicles approved to EC Whole Vehicle Type Approval standards.

Manufacturer's Plate

A piece of durable material e.g., metal or plastic that is likely to last the life of the vehicle and which is permanently marked with the required markings.

Matched Pair

For the purpose of this manual only:

Lamps fitted to the vehicle must be of the same brightness, intensity, colour, shape, height, position, and beam pattern.

Obvious modification

Where evidence suggests that the vehicle / component has been modified which invalidates the approval, evidence must be easily recognisable without the need of a detailed inspection.

Off-Road Vehicle

Vehicles in Category N2

Are to be considered to be off-road vehicles either if the wheels are designed to be driven simultaneously, including vehicles where the drive to one axle can be disengaged; or

If the following three requirements are met

- 1) At least one front and at least one rear axle are designed to be driven simultaneously, including vehicles where the drive to one axle can be disengaged.
- 2) There is at least one differential locking mechanism or at least one mechanism having a similar effect.
- 3) They can climb a 25% gradient calculated for a solo vehicle.

Vehicles in category N3

Are to be considered to be off-road vehicles either if the wheels are designed to be driven simultaneously, including vehicles where the drive to one axle can be disengaged; or

If the following requirements are satisfied:

- At least half the wheels are driven,
- There is at least one differential locking mechanism or at least one mechanism having a similar effect,
- They can climb a 25 % gradient calculated for a solo vehicle,
- At least four of the following six requirements are satisfied:
- 1) The approach angle must be at least 25°,
- 2) The ramp angle must be at least 25°,
- 3) The ground clearance between the axles must be at least 300 mm,
- 4) The departure angle must be at least 25°,
- 5) The ground clearance under the front axle must be at least 250 mm,
- 6) The ground clearance under the rear axle must be at least 250 mm.

Production Vehicle

A vehicle of a make, model and type, mass produced by the vehicle manufacturer.

Radius

Refers to the external radius of curvature.

Rain flap

'Rain flap' means a flexible component mounted vertically behind the wheel, on the lower part of the chassis or the loading surface, or on the mudguard.

Seat Displacement Device

A device to permit forward tipping of a seat or the back rest to fold down.

Servo Assisted

A system where the muscular energy of the driver is supplemented by another energy source.

Stairway

A passageway incorporating a flight of steps, from one floor or level to another.

Unladen weight

The unladen weight of any vehicle is the weight of the vehicle excluding passengers, goods, or other items. It includes the body and all parts normally used with the vehicle or trailer when in use on the road but does not include the weight of the fuel or, if an electric vehicle, the batteries.

Vehicle cab

Constitutes the driver and passenger compartment, including the doors.

Zero emission vehicle (ZEV)

A vehicle without an internal combustion engine, or with an internal combustion engine that emits less than 1g CO_2/kWh as determined in accordance with Regulation (EC) No 595/2009 and its implementing measures.

Record of Revision

Revision: 7

Revision	Date	Description of Change
1	24/04/2009	
2	16/08/2010	Add definitions
3	31/01/2011	Add definition of Approval Authority
4	29/10/2014	Minor revisions
5	01/09/2015	Minor revisions
6	10/04/2018	Revision to definition of major manufacturer, Add definition of forward control vehicle & Emergency vehicle, revision to extreme outer edge definition
7	20/10/2023	Definition of Hybrid Electric Vehicle & Zero emission vehicle added
