For additional information including regional data on COVID-19 and other respiratory viruses, COVID-19 in educational settings, co- and secondary infections with COVID-19 and other data supplementary to this report, please refer to the accompanying graph pack.

For additional information regarding data source please refer to Sources of surveillance data for influenza, COVID-19 and other respiratory viruses.
Executive summary

This report summarises the information from the surveillance systems which are used to monitor COVID-19 (caused by SARS-CoV-2), influenza, and diseases caused by seasonal respiratory viruses in England. References to COVID-19 represent the disease name and SARS-CoV-2 represent the virus name. The report is based on data from week 44 (between 30 October and 5 November 2023).

Overall

In week 44, influenza activity remained stable across most indicators. COVID-19 activity showed a decrease of activity across almost all indicators. Respiratory syncytial virus (RSV) activity continued to rise in all indicators, driven by marked increases in children.

Influenza

Through Respiratory DataMart, influenza positivity remained stable at 1.4% in week 44 compared to 1.3% in the previous week.

Through primary care surveillance, the influenza-like-illness (ILI) consultations indicator remained stable at 3.3 per 100,000 in week 44 compared to 3.2 per 100,000 the previous week and was within the baseline activity level range.

There was one influenza confirmed outbreak reported in England in week 44.

Overall, influenza hospitalisations remained within baseline activity levels in week 44. Influenza intensive care unit (ICU) or high dependency unit (HDU) admissions remained within baseline activity levels compared to the previous week. There were 2 new influenza ICU or HDU admissions in week 44.

Emergency department (ED) attendances for influenza-like illness remained stable nationally.

Influenza vaccine uptake for the 2023 to 2024 influenza season is reported for the fifth time. Compared to the equivalent week in the 2022 to 2023 season, vaccine uptake remains higher for those aged 65 years and over, pregnant women and 2 and 3 year olds; and is comparable for those under 65 years in clinical risk groups.

COVID-19

Through Respiratory DataMart, SARS-CoV-2 positivity decreased to 7.6% in week 44 compared to 8.5% in the previous week.

COVID-19 case rates and positivity rates through Pillar 1 decreased in most age groups, regions and ethnic groups in week 44.
The overall number of reported SARS-CoV-2 confirmed outbreaks decreased compared to the previous week. There were 5 SARS-CoV-2 confirmed outbreaks reported in week 44 in England.

Overall, COVID-19 hospitalisations decreased to 3.45 per 100,000 in week 44 compared to 4.04 per 100,000 in the previous week. Hospitalisations were highest in the 85 years and over age group. COVID-19 ICU admissions remained low and stable in week 44 compared to the previous week.

Through syndromic surveillance indicators, ED attendances for COVID-19 -like illness continued to decrease nationally.

**RSV**

Through Respiratory DataMart, positivity for RSV increased to 10.7%, with the highest positivity in those aged under 5 years old at 39.4%. ED attendances for acute bronchiolitis continued to increase nationally. Overall, RSV hospitalisations increased to 2.4 per 100,000 compared to 1.9 per 100,000 in the previous week. The highest rate was seen in the under 5 year olds at 33.5 per 100,000, which increased from 27.0 per 100,000 in the previous week.

**Other viruses**

Adenovirus positivity remained low at 2.2%, with the highest positivity in children under 5 years old at 5.0%. Human metapneumovirus (hMPV) positivity remained low at 1.4%, with the highest positivity in children under 5 years old at 3.8%. Parainfluenza positivity remained low at 0.6%, with the highest positivity in children under 5 years old at 1.6%. Rhinovirus positivity decreased to 13.3% overall, with the highest positivity in children under 5 years old at 20.2%.
Laboratory surveillance

Respiratory DataMart system (England)

In week 44, data is based on reporting from 10 out of the 16 sentinel laboratories.

In week 44, 4,424 respiratory specimens reported through the Respiratory DataMart System were tested for influenza. Of these, 63 samples tested positive for influenza; 42 influenza A (not subtyped), 8 influenza A(H3N2) and 13 were influenza B (Figure 4). Overall, influenza positivity remained stable at 1.4% in week 44 compared to 1.3% in the previous week.

In week 44, 4,362 respiratory specimens reported through the Respiratory DataMart System were tested for SARS-CoV-2. There were 331 samples that tested positive for SARS-CoV-2 with an overall positivity of 7.6%, which decreased compared to 8.5% in the previous week. The highest positivity was seen in adults older than 65 years of age at 10.5%.

Adenovirus positivity remained low at 2.2%, with the highest positivity in children under 5 years old at 5.0%.

Human metapneumovirus (hMPV) positivity remained low at 1.4%, with the highest positivity in children under 5 years old at 3.8%.

Parainfluenza positivity remained low at 0.6%, with the highest positivity in children under 5 years old at 1.6%.

Rhinovirus positivity decreased to 13.3% overall, with the highest positivity in children under 5 years old at 20.2%.

The overall positivity for RSV increased to 10.7%, with the highest positivity in those aged under 5 years old at 39.4%.

Figure 8: Respiratory DataMart weekly positivity (%) for RSV by age, England
Confirmed COVID-19 cases (England)

As of 9am on 30 October 2023, a total of 2,151,223 episodes have been confirmed for COVID-19 in England under Pillar 1 and 18,847,849 under Pillar 2 since the beginning of the pandemic.

In week 44, COVID-19 case rates and positivity continued to decrease in most age groups, regions, and ethnic groups through Pillar 1.

There were a total of 5,363 cases this week 44, a 22% decrease from the previous week. Case rates were highest in the over 80 age group, with 25.9 cases per 100,000, (a decrease from 37.8 per 100,000 in week 43) and in the North East, with 5.3 cases per 100,000 (a decrease from 6.3 per 100,000 in week 43).

**Data notes:** Changes to testing policies over time may affect positivity rates and incidence rates and should be interpreted accordingly. COVID-19 case reporting in England uses an episode-based definition which includes possible reinfections, each infection episode is counted separately if there are at least 91 days between positive test results (polymerase chain reaction (PCR) or rapid lateral flow device). Each infection episode begins with the earliest positive specimen date. Additionally, further changes in testing policy are in effect since 1 April 2023, which may affect case rates and positivity rates.

**Figure 9:** Confirmed COVID-19 episodes tested under Pillar 1, based on sample date with overall seven-day rolling average PCR positivity for Pillar 1 (%)

The vertical dashed line (red) denotes changes in testing policies.
**Age**

**Figure 10: Seven-day rolling average PCR positivity (%) of confirmed COVID-19 cases tested under Pillar 1 by age group**

Please note the highlighted line corresponds to the age group in the subplot title, grey lines correspond to all other age groups.

**Geography**

**Figure 11: Seven-day rolling average PCR positivity (%) of confirmed COVID-19 cases tested under Pillar 1 by UKHSA region**

Please note the highlighted line corresponds to the UKHSA region in the subplot title, grey lines correspond to all other regions.
Ethnicity

Figure 12: Weekly incidence of confirmed COVID-19 cases per 100,000 population by ethnicity (Pillar 1), England

Please note the highlighted line corresponds to the ethnicity in the subplot title, grey lines correspond to all other ethnicities.
Microbiological surveillance

SARS-CoV-2 variants

This section is updated fortnightly with updated data presented in this report.

UK Health Security Agency (UKHSA) conducts genomic surveillance of SARS-CoV-2 variants.

This section provides an overview of new and current circulating variants in England.

Detailed surveillance of particular variants of concerns can be found in recent technical briefings.

Information on whole genome sequencing coverage can be found in the accompanying slide set.

The prevalence of different UKHSA-designated variants amongst sequenced cases is presented in Figure 13.

To account for sequencing delays, we report the proportion of variants from sequenced cases between 23 October 2023 and 29 October 2023. Of those sequenced in this period, 25.7% were classified as XBB (V-22OCT-02), 6.8% as XBB.1.5 (V-23JAN-01), 19.8% as XBB.1.16 (V-23APR-01), 34.7% as EG.5.1 (V-23JUL-01), 10.9% as BA.2.86 (V-23AUG-01).
Figure 13: Prevalence of SARS-CoV-2 variants amongst available sequences cases for England from 7 November 2022 to 5 November 2023

The grey line indicates proportion of cases sequenced. The vertical dashed line (red) in April 2023 denotes changes in PCR testing in social care and hospital settings.

Sequencing data has a lag of approximately 2 weeks therefore the data presented should be interpreted in this context.
Cumulative numbers may be revised up or down as a result of reclassification.
Influenza virus characterisation

UKHSA characterises the properties of influenza viruses through one or more tests, including genome sequencing (genetic analysis) and haemagglutination inhibition (HI) assays (antigenic analysis). These data are used to compare how similar the currently circulating influenza viruses are to the strains included in seasonal influenza vaccines, and to monitor for changes in circulating influenza viruses. The interpretation of genetic and antigenic data sources is complex due to a number of factors, for example, not all viruses can be cultivated in sufficient quantity for antigenic characterisation, so that viruses with sequence information may not be able to be antigenically characterised as well. Occasionally, this can lead to a biased view of the properties of circulating viruses as the viruses which can be recovered and analysed antigenically may not be fully representative of majority variants, and genetic characterisation data does not always predict the antigenic characterisation.

As of week 44 2023, the UKHSA Respiratory Virus Unit (RVU) has genetically characterised 18 influenza A(H3N2) viruses, which were detected since week 34. Sequencing of the haemagglutinin (HA) gene shows that these A(H3N2) viruses belong in genetic subclade 3C.2a1b.2a.2 in the 2a.3a.1 subgroup. The Northern Hemisphere 2023/24 influenza A(H3N2) vaccine strain (an A/Darwin/9/2021-like virus) also belongs in genetic subclade 3C.2a1b.2a.2.

Thirteen influenza A(H1N1)pdm09 viruses have been characterised to date this season, with 8 belonging in genetic subgroup 6B.1A.5a.2a and 5 in subgroup 6B.1A.5a.2a.1. The Northern Hemisphere 2023/24 influenza A(H1N1)pdm09 vaccine strain (an A/Victoria/4897/2022 (H1N1)pdm09-like virus) also belongs in genetic subclade 6B.1A.5a, within the 6B.1A.5a.2a.1 cluster.

One influenza B/Victoria lineage virus has been genetically characterised belonging in subclade V1A3, within the subgroup V1A3a.2. The Northern Hemisphere 2023/24 influenza B/Victoria lineage vaccine strain (a B/Austria/1359417/2021-like virus) also belongs in this V1A3a.2 subclade/group.

At this early stage of the influenza season, it is too early to predict which influenza lineages will dominate throughout the season, and a close watch will be kept on the proportion of different viruses circulating to assist with the evaluation of vaccine effectiveness.

The RVU has confirmed by genome sequencing the detection of live attenuated influenza vaccine (LAIV) viruses in one influenza B positive sample and in one influenza A positive sample collected since week 40, from children aged between 2 and 16 years of age.

Influenza antiviral susceptibility

Influenza positive samples are genome sequenced and screened for mutations in the virus neuraminidase (NA) and the cap-dependent endonuclease (PA) genes known to confer neuraminidase inhibitor or baloxavir resistance, respectively. The samples tested are routinely obtained for surveillance purposes, but diagnostic testing of patients suspected to be infected with antiviral-resistant virus is also performed.

Influenza virus sequences from samples collected between weeks 34 of 2023 and 44 of 2023 have been analysed. Analysis of 18 A(H3N2) viruses found no viruses with known markers of resistance to neuraminidase inhibitors. Analysis of 11 A(H1N1)pdm09 by sequencing found one oseltamivir resistant virus with an H275Y amino acid substitution (99% H275Y). The sample was collected from an immune compromised adult who was known to have received oseltamivir treatment. Analysis of one influenza B NA sequence found no evidence of known markers of resistance to neuraminidase inhibitors.

No viruses with known markers of resistance to baloxavir marboxil were detected in 17 A(H3N2), 10 A(H1N1)pdm09 and one influenza B PA sequences analysed.

Community surveillance

Acute respiratory infection incidents (ARI)

Here we present data on acute respiratory infection (ARI) incidents in different settings that are reported to UKHSA Health Protection Teams (HPTs).

There were 43 new ARI incidents reported in week 44 in England including:

- 29 incidents reported from care homes, where 5 had at least one linked case that tested positive for SARS-CoV-2, 3 tested positive for rhinovirus and one for RSV
- 12 incidents reported from hospitals, where one had at least one linked case that tested positive for influenza A (not subtyped)
- 2 incidents reported from educational settings, where no test results were available

Figure 14: Number of ARI incidents by setting, England
Figure 15: Number of ARI incidents in all settings by virus type, England

Figure 16: Number of ARI incidents in care homes by virus type, England
Figure 17: Number of ARI incidents in educational settings by virus type, England
Google search queries

This is a web-based syndromic surveillance system which uses daily search query frequency statistics obtained from the Google Health Trends API (Application Programming Interface). This model focuses on search queries about COVID-19 symptoms as well as generic queries about ‘coronavirus’ (for example ‘COVID-19’). The search query frequency time series is weighted based on symptom frequency as reported in other data sources. Frequency of searches for symptoms is compared with a baseline calculated from historical daily data. Further information on this model is available online.

This figure was not updated this week. During week 43, the overall and media-debiasing weighted Google search scores remained stable compared to the previous week (Figure 18).

Figure 18: Normalised Google search score for COVID-19 symptoms, with weighted score for media-debiasing and historical trend, England
Flu Detector

FluDetector is a web-based model which assesses internet-based search queries for influenza-like illness (ILI) in the general population.

Daily ILI rate estimates are based on uniformly averaged search query frequencies for a week-long period (including the current day and the 6 days before it).

This figure was not updated this week. For week 43, the daily ILI rate was low and below the baseline threshold of 10.25 per 100,000 for the 2023 to 2024 season (Figure 19).

Figure 19: Daily estimated ILI Google search query rates per 100,000 population, England
Syndromic surveillance

During week 44, NHS 111 calls for cough increased in infants under one year old, calls for cold or flu remained stable and below baseline levels. GP in hours consultation rates for influenza-like illness (ILI) remained stable and similar to seasonally expected levels. ED attendances for ARI continued to increase nationally and particularly in infants aged under 5 years old (Figure 20). ED attendances for ILI remained stable nationally (Figure 21). ED attendances for acute bronchiolitis continued to increase nationally, particularly in children aged under 5 years old (Figure 22). ED for COVID-19-like illness continued to decrease nationally and across all age groups.

For further information on syndromic surveillance please see the [Syndromic Surveillance: weekly summaries](#).

EDSSS: acute bronchiolitis by age (years) 30/10/2022 to 29/10/2023

The scales may vary in each graph to enable trend comparison. The black line is the 7-day moving average adjusted for bank holidays.

Please note, there was no update in week 14 for acute bronchiolitis syndromic surveillance.
Primary care surveillance

RCGP Clinical Indicators (England)

The weekly ILI consultation rate through the Royal College of general Practitioners (RCGP) surveillance remained stable at 3.3 per 100,000 registered population in participating GP practices in week 44 compared to 3.2 per 100,000 in the previous week. This is within baseline activity levels (less than 10.25 per 100,000) (Figure 23). By age group, the highest rates were seen in those aged below 1 years old (4.9 per 100,000) followed by those aged between 15 and 44 years of age (4.1 per 100,000). The lower respiratory tract infections (LRTI) consultation rate increased slightly to 83.9 per 100,000 in week 44 compared to 77.9 per 100,000 in the previous week.

Figure 23: RCGP ILI consultation rates, all ages, England

Moving Epidemic Method (MEM) thresholds are based on data from the 2015 to 2016 season to the 2022 to 2023 season. Please note the 2020 to 2021 and 2021 to 2022 seasons have been removed due to low activity throughout these seasons.
RCGP sentinel swabbing scheme in England

Based on the date samples were received in the reference laboratory, in week 44 2023 (week commencing 30 October 2023) 405 samples were tested through the GP sentinel swabbing scheme in England, of which 67 samples tested positive (Figure 24). Among all positive samples, 38.8% were positive for RSV, 34.3% for rhinovirus, 20.9% for SARS-CoV-2, 4.5% for hMPV and 1.5% for adenovirus (Figure 25).

Based on the date samples were taken, positivity for RSV was 16.2%, positivity for SARS-CoV-2 was 4.1%, and positivity for influenza was 0.0% in week 44 (Figure 26). Data for the most recent week will be updated retrospectively.
Figure 24: Number of samples tested for SARS-CoV-2, influenza, and other respiratory viruses in England by week, GP sentinel swabbing

Unknown category corresponds to samples with no result yet.

Secondary care surveillance

Influenza, SARI Watch

Surveillance of influenza hospitalisations to all levels of care is based on data from a small sentinel network of acute NHS trusts in England. Surveillance of admissions to ICU or HDU for influenza is mandatory with data required from all acute NHS trusts in England. Please note that the SARI-Watch rates for 2023 to 2024 use the latest trust catchment population. For consistency the rates have been updated back to October 2020. The population denominator reflects changes in trust reconfiguration, hospital admission activity and population estimates.

In week 44 (ending 5 November 2023), the overall weekly hospital admission rate for influenza remained low but increased to 0.39 per 100,000 compared to 0.19 per 100,000 in the previous week. The rate in the latest week remained within baseline activity levels. By age group, the highest hospital admission rate was in those under 5 years old. There were 36 new hospital admissions for influenza (20 influenza A(not subtyped), 8 influenza A(H3N2), 4 influenza A(H1N1)pdm09 and 4 influenza B).

In week 44, the overall ICU or HDU rate for influenza remained low at 0.00 per 100,000 compared to 0.02 per 100,000 in the previous week. The rate in the latest week remained within baseline activity levels. There were 2 new case reports of an ICU or HDU admission for influenza in week 44 (2 influenza A(H1N1)pdm09).
Figure 27: Weekly overall influenza hospital admission rates per 100,000 trust catchment population with MEM thresholds, reported through SARI Watch, England

MEM thresholds are based on data from the 2015 to 2016 season to the 2022 to 2023 season. Please note the 2020 to 2021 and 2021 to 2022 seasons have been removed due to low activity throughout these seasons.

Influenza hospital admission rate based on 21 sentinel NHS trusts for week 44.

SARI Watch data is provisional and subject to retrospective updates.
Figure 28: Weekly influenza hospital admissions by influenza type, reported through SARI Watch, England

Number of influenza hospital admissions based on sentinel NHS trusts.

Figure 29: Weekly hospital admission rate by UKHSA region for new influenza reported through SARI Watch*

Rates in some regions may not include all influenza surveillance sentinel sites from week to week. Please note the highlighted line corresponds to the UKHSA region in the subplot title, grey lines correspond to all other regions.
Figure 30: Weekly hospital admission rate by age group for new influenza reported through SARI Watch - a) fixed y-axis, b) adjusted y-axis

Please note the highlighted line corresponds to the age group in the subplot title, grey lines correspond to all other age groups.

b)
MEM thresholds are based on data from the 2015 to 2016 season to the 2022 to 2023 season. Please note the 2020 to 2021 and 2021 to 2022 seasons have been removed due to low activity throughout these seasons.

Influenza ICU or HDU admission rate based on 92 NHS trusts for week 44. SARI Watch data is provisional and subject to retrospective updates.
Figure 32: Weekly influenza ICU or HDU admissions by influenza type, reported through SARI Watch, England

Figure 33: Weekly ICU or HDU admission rate by UKHSA region for new influenza, reported through SARI Watch

Please note the highlighted line corresponds to the UKHSA region in the subplot title, grey lines correspond to all other regions.
Figure 34: Weekly ICU or HDU admission rate by age group for new influenza cases, reported through SARI Watch - a) fixed y-axis, b) adjusted y-axis

Please note the highlighted line corresponds to the age group in the subplot title, grey lines correspond to all other age groups.
COVID-19, SARI Watch

Surveillance of COVID-19 hospitalisations to all levels of care and surveillance of admissions to ICU or HDU for COVID-19 are both mandatory with data required from all acute NHS trusts in England. Please note that the SARI-Watch rates for 2023 to 2024 use the latest trust catchment population. For consistency the rates have been updated back to October 2020. The population denominator reflects changes in trust reconfiguration, hospital admission activity and population estimates.

In week 44 (ending 5 November 2023), the overall weekly hospital admission rate for COVID-19 decreased to 3.45 per 100,000 compared to 4.04 per 100,000 in the previous week. By UKHSA region, the highest hospital admission rate for COVID-19 was observed in the North West. By age group, the highest hospital admission rate for COVID-19 continues to be in those aged 85 years old and over.

In week 44 (ending 5 November 2023), the overall weekly ICU or HDU admission rate for COVID-19 remained low at 0.10 per 100,000, compared to 0.14 per 100,000 in the previous week. Note that ICU or HDU admission rates may represent a lag from admission to hospital to an ICU or HDU ward. The ICU or HDU admission rate for COVID-19 by UKHSA region or by age group fluctuated at low levels in week 44 due to low underlying numbers.

Figure 35: Weekly overall COVID-19 hospital admission rates per 100,000 trust catchment population, reported through SARI Watch, England

COVID-19 hospital admission rate based on 88 NHS trusts for week 44.
SARI Watch data is provisional and subject to retrospective updates.
Figure 36: Weekly hospital admission rate by UKHSA region for new COVID-19 positive cases, reported through SARI Watch*

Please note the highlighted line corresponds to the UKHSA region in the subplot title, grey lines correspond to all other regions.
Figure 37: Weekly hospital admission rate by age group for new COVID-19 positive cases reported through SARI Watch - a) fixed y-axis, b) adjusted y-axis

Please note the highlighted line corresponds to the age group in the subplot title, grey lines correspond to all other age groups.

b)
Figure 38: Weekly overall COVID-19 ICU or HDU admission rates per 100,000 trust catchment population, reported through SARI Watch, England

COVID-19 ICU or HDU admission rate based on 78 NHS trusts for week 44. SARI Watch data is provisional and subject to retrospective updates.

Figure 39: Weekly ICU or HDU admission rate by UKHSA region for new COVID-19 positive cases reported through SARI Watch

Please note the highlighted line corresponds to the UKHSA region in the subplot title, grey lines correspond to all other regions.
Figure 40: Weekly ICU or HDU admission rate by age group for new COVID-19 positive cases reported through SARI Watch - a) fixed y-axis, b) adjusted y-axis

Please note the highlighted line corresponds to the age group in the subplot title, grey lines correspond to all other age groups.

b)
ECMO, SARI Watch

There were 3 new extra corporeal membrane oxygenation (ECMO) admissions reported in week 44 from the 7 Severe Respiratory Failure (SRF) centres in the UK. Two admissions were due to suspected acute respiratory infection.

Please note that the ‘Other’ group includes other viral, bacterial or fungal ARI, suspected ARI, non-infection (such as asthma, primary cardiac, trauma etc) and sepsis of non respiratory origin.

**Figure 41: Laboratory confirmed ECMO admissions in adults (COVID-19, influenza and non-COVID-19 confirmed) to Severe Respiratory Failure centres in the UK**

SARI Watch data is provisional and subject to retrospective updates.
RSV admissions, SARI Watch

Data on hospitalisations, including ICU or HDU admissions, with RSV are shown below. RSV SARI Watch surveillance is sentinel. Please note that the SARI-Watch rates for 2023 to 2024 use the latest trust catchment population. For consistency the rates have been updated back to October 2020. The population denominator reflects changes in trust reconfiguration, hospital admission activity and population estimates.

In week 44, the overall hospital admission rate for RSV increased to 2.40 per 100,000 compared to 1.88 per 100,000 in the previous week. The highest rate was seen in the under 5 year olds at 33.46 per 100,000, which increased from 27.00 per 100,000 in the previous week.

Figure 42: Weekly overall hospital admission rates (including ICU or HDU) of RSV positive cases per 100,000 population reported through SARI Watch, England

Please note that rates are based on the number of hospitalised cases divided by the Trust catchment population, multiplied by 100,000.
Figure 43: Weekly count hospital admissions of RSV positive cases reported through SARI Watch sentinel surveillance by level of care, England
Figure 44: Weekly hospitalisation (including ICU or HDU) admission rates by age group for new RSV cases reported through SARI Watch, England - a) fixed y-axis, b) adjusted y-axis

Please note the highlighted line corresponds to the age group in the subplot title, grey lines correspond to all other age groups.

b) SARI Watch data is provisional.
Mortality surveillance

COVID-19 deaths

Daily excess all-cause mortality (England)

For further information on excess all-cause mortality in England please see the [Fingertips excess mortality in England report](https://www.gov.uk/fingertips-excess-mortality-in-england-report), which uses Office for National Statistics (ONS) death registration data and the [all-cause mortality surveillance report](https://www.gov.uk/all-cause-mortality-surveillance-report), which uses the EuroMOMO model to identify weeks with higher than expected mortality.
Influenza vaccination

Influenza vaccine uptake in GP patients

Weekly vaccine coverage data are provisional.

Up to week 44 of 2023, in 39.3% of GP practices reporting weekly to ImmForm for the main collection, the provisional proportion of people in England who had received the 2023 to 2024 influenza vaccine in targeted groups was as follows:

- 33.4% in those under 65 years in a clinical risk group
- 25.6% in all pregnant women
- 72.5% in all those aged 65 years and over

**Figure 45: Cumulative weekly influenza vaccine uptake by target group in England**

![Cumulative weekly influenza vaccine uptake by target group in England](image-url)
In 2023 to 2024, all 2 and 3 year olds continue to be eligible for influenza vaccination through their GPs. Up to week 44 of 2023, in 39.9% of GP practices reporting weekly to ImmForm for the childhood collection, the provisional proportion of children in England who had received the 2023 to 2024 influenza vaccine in targeted groups was as follows:

- 35.1% in all 2 year olds
- 33.2% in all 3 year olds

**Figure 46: Cumulative weekly influenza vaccine uptake in 2 and 3 year olds, in England**

These data represent both healthy and at risk children.
COVID-19 vaccination

COVID-19 vaccine uptake in England

The data for week 44 only includes information up to Friday, 3 November. This is due to delayed receipt of data files in time for extraction on Monday 6 November. The data for the most recent week is therefore incomplete. This will be corrected in the next weeks.

COVID-19 vaccinations began in England on 8 December 2020 during week 50 2020 (week ending 13 December 2020). Cumulative data up to the end of week 44 2023 (week ending 03 November 2023) was extracted from the National Immunisation Management Service (NIMS). The data presented this week is the provisional proportion of living people resident in England who had received COVID-19 vaccinations. Individuals vaccinated in England who have a registered address outside of England or where their address, age, or sex is unknown have been excluded. Due to changes in GP practice lists, in order to include newly registered patients and remove those who are no longer resident, there will be slight variation to the figures to reflect those who are currently resident in England.

Age is calculated as age on 31 March 2024. From 23rd October, data is extracted on a Monday with data capped to the previous Sunday. This change from Tuesday data extraction means that because of data lags, reported coverage for the most recent week is marginally lower than if data was extracted on Tuesday. This change has been implemented to help ensure timely reporting. All backing data is updated each week going back to the start of the programme.

Data is provisional and subject to change following further validation checks. There are significant changes being undertaken in the data feeds that provide these statistics. It is therefore necessary to report the autumn campaign on a fixed denominator, the population as at 31 August 2023. Any changes to historic figures will be reflected in the most recent publication. Please note that numbers published by UKHSA are for public health surveillance purposes only.

Autumn 2023 Campaign

Immunity derived from vaccination declines over time, Joint Committee on Vaccination and Immunisation (JCVI) has recommended an autumn 2023 campaign with the primary objective to boost immunity in those at higher risk from COVID-19 and thereby optimise protection against severe COVID-19, specifically hospitalisation and death in time for winter 2023 to 2024.

The autumn 2023 data reported below covers any dose administered from the 1 September 2024 provided there is at least 20 days from the previous dose. Eligible groups for the autumn campaign are defined in the COVID-19 healthcare guidance Green Book.

Table 4 presents coverage as measured against the total population and includes people who are not yet due to have their autumn 2023 booster, specifically those turning 65 years of age by the 31 March 2024. It is important that unvaccinated individuals, especially vulnerable adults, receive a primary course of vaccination, irrespective of whether individuals have had previous
infection. To understand the data in the context of vaccine waning across the whole COVID-19 programme, we present Table 5 which shows how recently a person who is living and resident in England has been vaccinated either through the primary vaccination campaign or a subsequent booster campaign.

By the end of week 44 2023 (week ending 3 November 2023), 63.2% (7,050,519 out of 11,164,326) of all people aged over 65 years old who are living and resident in England who had been vaccinated with an autumn 2023 booster dose since 1 September 2023, Table 4 and Figure 47.

</table>

Table 5 is presented to provide an overview of how recently a person has been vaccinated either through the primary vaccination campaign or subsequent booster campaigns. This helps us understand the data in the context of vaccine waning across the whole COVID-19 programme. Breakdowns by Ethnicity, and IMD, for those aged 65 and over can be found in the backing tables.
For a regional breakdown of the ethnicity data, please see the accompanying data file for this report.

For COVID-19 data on the real-world effectiveness of the COVID-19 vaccines, and on COVID-19 vaccination in pregnancy, please see the COVID-19 vaccine surveillance reports.

For COVID-19 management information on the number of COVID-19 vaccinations provided by the NHS in England, please see the COVID-19 vaccinations webpage.

For UK COVID-19 daily vaccination figures and definitions, please see the Vaccinations’ section of the UK COVID-19 dashboard.

The population coverage data representing the evergreen offer of doses 1, 2, and 3 has changed little in recent months and are no longer presented in both the UKHSA weekly flu and COVID-19 surveillance reports and in the UK COVID-19 Dashboard. Both the UKHSA weekly flu and COVID-19 surveillance reports and in the UK COVID-19 Dashboard now highlight data on the most recent vaccination campaign in those at higher risk from COVID-19 as immunity derived from vaccination declines over time. The overall vaccine uptake in the living and resident population for those with at least dose 1, 2 and 3 doses is still available within the backing tables for this section and in the dashboard APIs.
