Assessing fitness to drive
– a guide for medical professionals

www.gov.uk/dvla/fitnesstodrive

January 2024
High level changes

Chapter – General information
Changes to use of the word ‘consent’ – DVLA now refers to this as ‘authorisation’, after a recent law change.

Changes to the section around outcomes of medical enquiries, to clarify for DPA purposes that DVLA does not routinely share outcomes with clinicians.

Removal of the telephony and fax options for medical professionals to contact the Drivers Medical department as these channels are no longer available.

Chapter 1 – Neurological disorders
Minor further clarification of what we mean by ‘epilepsy’ in respect of licensing.

Update to the standards for ‘Primary/central hypersomnias – including narcolepsy type 1 (narcolepsy with cataplexy) and type 2’ to require more stringent evidence of symptom control and the need for driving assessments where appropriate.

Minor updates to ‘Stroke and cerebral venous thrombosis’ for Group 1 and Group 2 to cover off stroke and TIAs.

Brain tumours: the classification of the various tumours has been completely redesigned, presenting tumours in respect of their level of risk to driving and also the treatment received.

Minor wording change to hydrocephalus for Group 1 to remove unnecessary reference to ‘till 70 licence’.

Subdural haematoma – merging standards for surgical and non-surgical treatment and renaming.

Cerebral Amyloid Angiopathy-related Transient Focal Neurologic Episodes (previously termed ‘amyloid spells’. This is a new standard.

Posterior Reversible Encephalopathy Syndrome (PRES) and Reversible Cerebral Vasocostriction Syndrome (RCVS). This is a new standard.

Arachnoid cysts – clarification of the standards and presented more clearly. Section tables significantly updated.

Colloid cysts – clarification of the standards and presented more clearly. Section tables significantly updated.

Arteriovenous malformation – clarification of the wording.

Dural Arteriovenous fistula – clarification of the wording.

Chapter 2 – Cardiovascular disorders
Change to the heading for Angina which includes INOCA (ischaemia with non-obstructive arteries).

Changes to the section title ‘ischaemia’ to include ‘with non-obstructive coronary artery disease “INOCA” and myocardial infarction due to non-obstructive coronary artery disease “MINOCA”’.

Changes to the Acute coronary syndrome heading to include MINOCA (myocardial infarction with non-obstructive coronary arteries).

New standard for Spontaneous Coronary Artery Dissection.

Changes to the section on ‘Marfan syndrome and other aortopathies’ in relation to Loeys-Dietz syndrome for Group 2.

Changes to the section on Heart Transplants, for Group 2, to be clearer on testing requirements.
Chapter 3 – Diabetes mellitus
Changes to the section ‘Managed by tablets carrying hypoglycaemia risk’ to reflect more accurately the exact requirements for glucose monitoring for Group 1.

Changes to the section on ‘Pancreas transplant’ to update requirements for licensing for Group 2.

Changes to the section on ‘Islet cell transplantation’ to update requirements for licensing for Group 1 and Group 2.

Changes to the time period for glucose monitoring for Group 2 from 3 months to 6 weeks, in order to mirror changes to the D4 in February 2023.

Chapter 4 – Psychiatric disorders
Minor tweak to the ‘Behavioural disturbances’ title to remove wording ‘dissociative seizures’. This brings the content in line with the equivalent content in ‘Neurological disorders’.

Chapter 5 – Drug or alcohol misuse or dependence
Introduction of a new standalone section for ‘High Risk Offenders’ to make the guidance itself clearer, and to relocate it from sitting in the ‘Alcohol Related Seizure’ section.

Minor amendments to the ‘Alcohol Related Seizure’ section to make clearer what standards should be applied.

Removal of minor duplication regarding benzodiazepines under ‘Drug misuse or dependence’ section.

Chapter 8 – Miscellaneous conditions
Significant changes to the section on ‘AIDS’, to modernise the language we use to describe the condition and to update the required medical standards to be more reflective of the likely low impacts upon safe driving.

Minor tweak to the moderate/severe obstructive sleep apnoea syndrome section for grammatical reasons.

Chapter – Appendices
Minor grammar changes to Appendix A.

Clarification of the Provoked Seizure paragraphs in Appendix B.

Significant changes to Appendix C for Cardiovascular considerations, including Exercise tolerance testing, stress myocardial perfusion scanning, coronary angiography, Marfan syndrome, Aortic stenosis and congenital heart disease. To note there have been no changes to the standards, the wording and testing requirements have been clarified.
Introduction

The impact of medical conditions on driving

Driving involves a complex and rapidly repeating cycle that requires a level of skill and the ability to interact simultaneously with both the vehicle and the external environment. Information about the environment is via the visual and auditory senses and is acted on by many cognitive processes (including short-and long-term memory, and judgement) to affect decisions for the driving task in hand. These decisions are enacted by the musculoskeletal system, which acts on the controls of the vehicle and its relation to the road and other users.

The whole process is coordinated by complex interactions involving behaviour, strategic and tactical abilities, and personality. In the face of illness or disability, adaptive strategies are important for maintaining safe driving.

Safe driving requires, among other elements, the involvement of:
- vision
- visuospatial perception
- attention and concentration
- memory
- insight and understanding
- judgement
- adaptive strategies
- good reaction time
- planning and organisation
- ability to self-monitor
- sensation
- muscle power and control
- coordination

Given these requirements, it follows that many body systems need to be functional for safe driving – and injury or disease may affect any one or more of these abilities. Notwithstanding this, many short term conditions do not require notification to DVLA.

The guidelines and their development

The drivers’ medical section within DVLA deals with all aspects of driver licensing when there are medical conditions that impact, or potentially impact, on safe control of a vehicle.

To do this, DVLA develops and works within guidance, and this publication summarises the national medical guidelines on fitness to drive. It is intended to assist doctors and other healthcare professionals in advising their patients:
- whether or not DVLA requires notification of a medical condition
- what the licensing outcome from DVLA’s medical enquiries is likely to be
Introduction

Some of the guidelines – for example, those around diabetes mellitus, epilepsy and vision – are set against legislative requirements (see Appendix A for details) but others are the result of advice from the 6 Honorary Medical Advisory Panels to the Secretary of State, which cover:

- cardiology
- neurology
- diabetes
- vision
- alcohol or substance misuse and dependence
- psychiatry

Each panel consists of acknowledged experts in the relevant area and includes DVLA and lay membership. The panels meet biannually and, between meetings, give continual advice to the Secretary of State and DVLA.

The medical standards are continually reviewed and updated when indicated in light of recent developments in medicine generally, and traffic medicine in particular. The most up-to-date version of this guide will always be online on GOV.UK.

General information

GB driver licensing

Licensing and licence groups
The GB medical standards for driver licensing refer to Group 1 and Group 2 licence holders:

- Group 1 includes cars and motorcycles
- Group 2 includes large lorries (category C) and buses (category D)

In most cases, the medical standards for Group 2 drivers are substantially higher than for Group 1 drivers. This is because of the size and weight of the vehicle and the length of time an occupational driver typically spends at the wheel.

Drivers who were awarded a Group 1 category B (motor car) licence before 1st January 1997 have additional entitlement to categories C1 (medium-sized lorries, 3.5t to 7.5t) and D1 (minibuses, 9 to 16 seats, not for hire or reward). Drivers with this entitlement retain it only until their licence expires or it is revoked for medical reasons. On subsequent renewal or reapplication, the higher medical standards applicable to Group 2 will apply.

Under certain circumstances, volunteer drivers may drive a minibus of up to 16 seats without category D1 entitlement. DVLA outlines the rules for such circumstances on the GOV.UK website (see Driving a minibus).

Age limits for licensing

Group 1
Licences are normally valid until 70 years of age (the ‘til 70 licence) unless restricted to a shorter duration for medical reasons.

There is no upper age limit to licensing, but after 70 renewal is required every 3 years.

A person in receipt of the mobility component of Personal Independence Payment (PIP) can hold a driving licence from 16 years of age. (A person can’t apply for PIP until their 16th birthday.)

Group 2
The minimum age for Group 2 entitlement to drive lorries (category C) is 21 and for buses (category D) is 24, unless the driver is undergoing or has passed the Driver Certificate of Competence (CPC) initial qualification which they can do at the age of 21. The Group 2 licensing entitlement is valid for a maximum of 5 years. New applicants for a Group 2 licence are required to have a D4 medical examination completed by a registered medical practitioner. Drivers under the age of 45 are required to renew their Group 2 licence every 5 years by way of self-declaration.

When a Group 2 driver reaches the age of 45, their licence will expire and they will need to have a D4 medical examination. Drivers above the age of 45 will need to renew their driving licence every 5 years and will need to have a D4 medical examination each time they renew.

Once a Group 2 driver reaches the age of 65, they need to renew their licence and have a D4 medical examination every year.
General information

Group 2 drivers must notify DVLA if they develop a notifiable medical condition. Shorter duration licences may be issued for medical reasons.

There are exceptions, such as driving in the armed forces, and people of a minimum age of 18 can drive lorries and buses after gaining, or training towards, the Driver CPC.

**Police, fire, ambulance and health service driver licensing**

The same medical standards apply for drivers of police, fire, coastguard, ambulance and health service vehicles as they do for all drivers holding Group 1 and 2 licences. Any responsibility for determining higher medical standards, over and above these licensing requirements, rests with the individual force, service or other relevant body.

**Taxi licensing**

Responsibility for determining any higher standards and medical requirements for taxi drivers, over and above the driver licensing requirements, rests with Transport for London in the Metropolitan area, or the local council in all other areas.

Decisions taken by employers on the use and application of the GB standards on fitness to drive in particular circumstances and as they relate to employees are for the employer to make. Any responsibility for determining higher medical standards, over and above these licensing requirements, rests with the individual force, service or other relevant body.

**Interpretation of GB legislation**

The advice of the Honorary Medical Advisory Panels on the interpretation of GB legislation and its appropriate application is made within the context of driver licensing.

**Sudden disabling events**

Anyone with a medical condition likely to cause a sudden disabling event at the wheel, or who is unable to control their vehicle safely for any other reason, **must not drive**.

DVLA defines the risk of a sudden disabling event as:

- 20% likelihood of an event in 1 year for Group 1 licensing
- 2% likelihood of an event in 1 year for Group 2 licensing

These figures, while originally defined by older studies, have since been revalidated by more recent risk-of-harm calculations.
General information

DVLA notification by drivers or healthcare professionals

Applicants and licence holders have a legal duty to:

- notify DVLA of any injury or illness that would have a likely impact on safe driving ability (except some short-term conditions that are unlikely to continue beyond 3 months, as set out in this guide)
- respond fully and accurately to any requests for information from either DVLA or healthcare professionals
- comply with the requirements of the issued licence, including any periodic medical reviews indicated by DVLA

They should also adhere, with ongoing consideration of fitness to drive, to prescribed medical treatment, and to monitor and manage the condition and any adaptations.

Doctors and other healthcare professionals should:

- advise the individual on the impact of their medical condition for safe driving ability
- advise the individual on their legal requirement to notify DVLA of any relevant condition
- treat, manage and monitor the individual’s condition with ongoing consideration of their fitness to drive
- notify DVLA directly of an individual’s medical condition or fitness to drive, where they cannot or will not notify DVLA themselves

Of course, this last obligation on professionals may pose a challenge to issues of authorisation and the relationship between patient and healthcare professional. The General Medical Council (GMC) and the General Optical Council (GOC) offer guidance on this which is summarised below.

In law, it is the duty of the licence holder or applicant to notify DVLA of any medical condition that may affect safe driving. Individuals from Scotland, Wales and England can notify via GOV.UK – see Medical conditions, disabilities and driving.

For people with licences issued by the Driver and Vehicle Agency in Northern Ireland, the options for direct notification are given on the NI Direct page: How to tell DVA about a medical condition.

Circumstances may arise in which a person cannot or will not notify DVLA. It may be necessary for a doctor, optometrist or other healthcare professional to consider notifying DVLA under such circumstances if there is concern for road safety, which would be for both the individual and the wider public.

The General Medical Council (GMC) and the General Optical Council (GOC) offer clear guidance about notifying the DVLA when the person cannot or will not exercise their own legal duty to do so.

The GMC guidelines 2017 (reproduced with permission) state:

1. In our guidance Confidentiality: good practice in handling patient information we say:

   1. Trust is an essential part of the doctor-patient relationship and confidentiality is central to this. Patients may avoid seeking medical help, or may under-report symptoms, if they think that their personal information will be disclosed by doctors without consent, or without the chance to have some control over the timing or amount of information shared.
60. Doctors owe a duty of confidentiality to their patients, but they also have a wider duty to protect and promote the health of patients and the public.

62. You should ask for a patient’s consent to disclose information for the protection of others unless it is not safe or practicable to do so, or the information is required by law. You should consider any reasons given for refusal.

64. If it is not practicable to seek consent, and in exceptional cases where a patient has refused consent, disclosing personal information may be justified in the public interest if failure to do so may expose others to a risk of death or serious harm. The benefits to an individual or to society of the disclosure must outweigh both the patient’s and the public interest in keeping the information confidential.

68. If you consider that failure to disclose the information would leave individuals or society exposed to a risk so serious that it outweighs patients’ and the public interest in maintaining confidentiality, you should disclose relevant information promptly to an appropriate person or authority. You should inform the patient before disclosing the information, if it is practicable and safe to do so, even if you intend to disclose without their consent.

About this guidance

2. Doctors owe a duty of confidentiality to their patients, but they also have a wider duty to protect and promote the health of patients and the public. This explanatory guidance sets out the steps doctors should take if a patient’s failure or refusal to stop driving exposes others to a risk of death or serious harm.

Fitness to drive: doctors’ and patients’ responsibilities

3. The Driver and Vehicle Licensing Agency (DVLA) in England, Scotland and Wales and the Driver and Vehicle Agency (DVA) in Northern Ireland are legally responsible for deciding if a person is medically unfit to drive. This means they need to know if a person holding a driving licence has a condition or is undergoing treatment that may now, or in the future, affect their safety as a driver.

4. The driver is legally responsible for telling the DVLA or DVA about any such condition or treatment. Doctors should therefore alert patients to conditions and treatments that might affect their ability to drive and remind them of their duty to tell the appropriate agency. Doctors may, however, need to make a decision about whether to disclose relevant information without consent to the DVLA or DVA in the public interest if a patient is unfit to drive but continues to do so.

Assessing a patient’s fitness to drive

5. When diagnosing a patient’s condition, or providing or arranging treatment, you should consider whether the condition or treatment may affect their ability to drive safely. You should:

■ refer to the DVLA’s guidance Assessing fitness to drive – a guide for medical professionals, which includes information about disorders and conditions that can impair a patient’s fitness to drive

■ seek the advice of an experienced colleague or the DVLA’s or DVA’s medical adviser if you are not sure whether a condition or treatment might affect a patient’s fitness to drive.
General information

Reporting concerns to the DVLA or DVA

6. If a patient has a condition or is undergoing treatment that could impair their fitness to drive, you should:
   
   a. explain this to the patient and tell them that they have a legal duty to inform the DVLA or DVA
   
   b. tell the patient that you may be obliged to disclose relevant medical information about them, in confidence, to the DVLA or DVA if they continue to drive when they are not fit to do so
   
   c. make a note of any advice you have given to a patient about their fitness to drive in their medical record.

7. If a patient is incapable of understanding this advice – for example, because of dementia – you should inform the DVLA or DVA as soon as practicable.

8. If a patient refuses to accept the diagnosis, or the effect of the condition or treatment on their ability to drive, you can suggest that they seek a second opinion, and help arrange for them to do so. You should advise the patient not to drive in the meantime. As long as the patient agrees, you may discuss your concerns with their relatives, friends or carers.

9. If you become aware that a patient is continuing to drive when they may not be fit to do so, you should make every reasonable effort to persuade them to stop. If you do not manage to persuade the patient to stop driving, or you discover that they are continuing to drive against your advice, you should consider whether the patient’s refusal to stop driving leaves others exposed to a risk of death or serious harm. If you believe that it does, you should contact the DVLA or DVA promptly and disclose any relevant medical information, in confidence, to the medical adviser.

10. Before contacting the DVLA or DVA, you should try to inform the patient of your intention to disclose personal information. If the patient objects to the disclosure, you should consider any reasons they give for objecting. If you decide to contact the DVLA or DVA, you should tell your patient in writing once you have done so, and make a note on the patient’s record.

Responding to requests for information from the DVLA or the DVA

11. If you agree to prepare a report or complete or sign a document to assist the DVLA’s or the DVA’s assessment of a patient’s fitness to drive, you should do so without unreasonable delay.

See the full guidance at the GMC website, Confidentiality: patients’ fitness to drive and reporting concerns to the DVLA or DVA (2017).

The GOC offers similar guidance, available in full at its website under the confidentiality section of its General Optical Council Standards (use the subsection on ‘disclosing confidential information about patients with or without consent’).

This guidance includes the following (reproduced with permission of GOC):

Disclosing information with consent

Where you are not sharing information with other healthcare professionals for the purpose of providing (or supporting the provision of) direct care to a patient, you should always try to get your patient’s explicit consent to disclose sensitive information about them, unless any of the following apply:
General information

a. obtaining consent would defeat the purpose of the disclosure (for example, where there would be a risk of harm to others; where detection of a serious crime would be obstructed); or

b. you have already made the decision to disclose information in the public interest and obtaining consent would be meaningless or tokenistic; or

c. the patient is not able to give consent as a result of disability, illness or injury.

A patient’s ability to give consent is referred to as their ‘capacity’ to consent. For more information on capacity, including what to do if a patient lacks capacity, see our consent guidance.

Where your patient provides you with explicit consent to disclose confidential information about them, you must ensure that they know what they are consenting to (see Standards 2 and 3 of the Standards of Practice, and our consent guidance) and that they are clear what information is going to be disclosed, why it is being disclosed and to which person or authority. Where you are relying on implied consent (see paragraph 10 above), patients should not be surprised to learn how their information is used; if the information would be used in ways that patients would not reasonably expect, you should seek explicit consent for this from the patient.

It is important to remember that patients with the capacity to consent have the right to make their own decisions and to refuse consent, even where you or others may consider the decision to be ill-advised. If a patient makes a decision contrary to clinical advice, you should document this in the patient records so that it is clear to all involved in that patient’s care.

Disclosing information without consent

If a patient does not provide you with explicit consent to disclose confidential information about them, and if you cannot rely on implied consent, there may still be circumstances in which you may pass the information on to an appropriate authority, such as where it is in the public interest, or where there is a legal requirement for you to do so.

Notification can be provided by healthcare professionals in the above circumstances, in confidence:

By email: medadviser@dvla.gov.uk

By post:
Medical Business Support

How DVLA responds to notification and applies the medical standards

Once DVLA is notified of a medical condition and obtains authorisation, it will make medical enquiries as required.

The Secretary of State (in practice, DVLA) is unable to make a licensing decision until all the relevant medical information is available and has been considered. Exceptions to this do exist, specifically DVLA’s ability to revoke a licence immediately in the interests of road safety and without detailed enquiry if individual case circumstances dictate this.
General information

DVLA’s medical enquiries procedure is generally a 2-stage process:

1. Information on the medical condition is sought from the licence holder or applicant, either by paper questionnaire or online
2. Information is sought from relevant healthcare professionals, either by questionnaire or provision of medical notes.

In some circumstances DVLA will require independent review by a DVLA-appointed doctor or optician/optometrist. Depending on individual circumstances, a licence applicant may also require a driving assessment and/or appraisal.

Driving during medical enquiries

The time taken to obtain all necessary reports can be lengthy but a licence holder may retain entitlement to drive under Section 88 of the Road Traffic Act 1988. However, a driver whose last licence was revoked or refused because of a medical condition or is a high risk offender re-applying after a drink/drive disqualification from 1 June 2013 would not, however, be eligible to drive until they are issued with a new licence.

The driver may be covered to drive, but this carries implications for road safety in that the licence holder may continue to drive with a medical condition that, on completion of DVLA’s enquiries, may ultimately result in licence withdrawal.

It is for the patient to assure themselves that they are fit to drive. Medical professionals who are asked for an opinion about a patient’s fitness to drive in these circumstances should explain the likely outcome by reference to this guide. The final decision in relation to driver licensing will, however, rest with DVLA.

By reference to DVLA’s guidance, the doctor in charge of an individual’s care should be able to advise the driver whether or not it is safe for them to continue to drive during this period.

Patients must be reminded that if they choose to ignore medical advice to stop driving this may affect the validity of their motor insurance cover. Doctors are advised to formally and clearly document the advice given.

DVLA is solely reliant on doctors and other healthcare professionals for the provision of medical information. To make timely licensing decisions that impact on the safety of the individual and the public, DVLA needs information to be provided as quickly as possible.

When DVLA holds all relevant information, a decision can then be made as to whether or not the driver or applicant satisfies the national medical guidelines and the requirements of the law. A licence is accordingly issued or refused/revoked.

Outcome of medical enquiries

DVLA does not routinely tell doctors of the outcome of a medical enquiry. Drivers are always informed of the outcome, either by being issued a licence or by notification of a refusal or revocation.

For cases in which the driver may not have the insight and/or memory function to abide by the refusal or revocation of their licence – for example, in cognitive impairment, dementia or a mental health condition – DVLA may, in exceptional circumstances, send a decision letter to the GP in line with prevailing legislation and GMC guidance on disclosures in the public interest.

When a notification is received from a doctor in accordance with the GMC guidelines, unless relevant to one of these conditions affecting mental capacity, DVLA will send an acknowledgement letter only to the GP, to confirm receipt of the original notification.
General information

Medical notification form for use by healthcare professionals

The medical notification form for use when patients cannot or will not notify DVLA themselves is available, for use by healthcare professionals only, on GOV.UK. This form is only for patients living in England, Scotland or Wales who hold a driving licence issued by DVLA.

The completed form should be returned to:

medadviser@dvla.gov.uk
Or by post:
Medical Business Support
D7 West
DVLA
Swansea
SA6 7JL

For patients living in Northern Ireland who cannot or will not self-notify, please use these contact details:

dva@doeni.gov.uk
Telephone: 0300 200 7861
Drivers Medical Section
Driver and Vehicle Agency
Castlerock Road
Waterside
Coleraine
BT51 3TB

Please fill in all parts of DVLA’s medical notification form in relation to the medical condition of your patient. Parts A and B are for your patient’s and your own details, including your signed and dated declaration that all details are correct to the best of your knowledge.

Part C of the form should be completed in all fields and providing as much detail as possible regarding your patient’s medical condition. You may send clinic letters with this notification, to help provide details of your patient’s medical condition or if you think it will aid the licensing decision.

Please note, your patient can request copies of any medical documents held at DVLA unless you specify in writing that releasing this information could cause serious harm to your patient.

DVLA cannot be responsible for the payment of any fee associated with notification.
Obtaining advice from DVLA on fitness to drive

Contacting DVLA’s doctors

Doctors and other healthcare professionals are always welcome to write to or email one of DVLA’s doctors.

Advice may be sought about a particular driver identified by a unique reference number, or about fitness to drive in general.

The contact details for such enquiries in England, Scotland and Wales are:

medadviser@dvla.gov.uk
Drivers Medical Group
DVLA
Swansea
SA99 1DA

Please note that this service is for medical professionals only.

The contact details for enquiries in Northern Ireland are:

Telephone: 0300 200 7861
Drivers Medical Section
Driver and Vehicle Agency
Castlerock Road
Waterside
Coleraine
BT51 3TB

Seat belt use and exemption

The law makes it compulsory for car occupants to wear seatbelts where fixed. Exemption on medical grounds requires a valid exemption certificate to confirm that, in a medical practitioner’s view, exemption is justified. Exemption will require careful consideration in view of extensive evidence for the safety implications of seatbelts in reducing casualty rates.

The guidance leaflet Medical exemption from compulsory seat belt wearing.

Intracranial pressure monitoring device – inserted by burr hole surgery 59
Implanted electrodes .......................................................... 59
Serious neurological disorders

Changes to Annex III to the EC Directive 2006/126/EC require that driving licences may not be issued to, or renewed for, applicants or drivers who have a serious neurological disorder unless there is medical support from their doctors.

A serious neurological disorder is considered as:

- any condition of the central or peripheral nervous system presently with, or at risk of progression to a condition with, functional (sensory (including special senses), motor and/or cognitive) effects likely to impact on safe driving

Further information relating to specific functional criteria is provided on:

- specific neurological conditions in this chapter (Neurology)
- cognitive and related conditions
- visual conditions and disorders
- excessive sleepiness

When considering licensing for these customers, the functional status and risk of progression will be considered. A short term medical review licence is generally issued when there is a risk of progression.
Appendix B sets out the relevant regulations.

The following definitions apply:

- epilepsy encompasses all seizure types, including major, minor and auras
- if within a 24-hour period more than one epileptic event occurs, these are treated as a single event for the purpose of applying the epilepsy and seizure regulations
- from a licensing perspective, epilepsy means 2 or more unprovoked seizures over a period which exceeds 24 hours and less than five years apart
- epilepsy is prescribed in legislation as a relevant disability where there have been 2 or more epileptic seizures during the previous 5 year period
- isolated seizure means one or more unprovoked seizures within a 24 hour period, or one or more unprovoked seizures within a 24 hour period where that period of seizure has occurred more than 5 years after the last unprovoked seizure

The following features, in both Group 1 car and motorcycle and Group 2 bus and lorry drivers, are considered to indicate a good prognosis for a person under care for a first unprovoked or isolated epileptic seizure:

- no relevant structural abnormalities on brain imaging
- no definite epileptiform activity on EEG
- support of a neurologist
- annual risk of seizure considered to be 2% or lower for bus and lorry drivers

<table>

| Provoked seizures (except related to use of alcohol or illicit drugs) | ✗ Must not drive and must notify DVLA. Driving must cease for up to 5 years after the provoked seizure. See the special considerations in Appendix B and Provoked seizures. |
| Dissociative seizures | ✗ Must not drive and must notify DVLA. Licensing may be considered once episodes have been satisfactorily controlled for 3 months and there are no relevant mental health issues. If high risk features, a specialist’s review would be required prior to relicensing. |

continued
Special considerations

Group 1 car and motorcycle

The following special considerations apply to drivers of cars and motorcycles:

1. The person with epilepsy may qualify for a driving licence if they have been free from any seizure for 1 year. This needs to include being free of minor seizures, including those that do not involve a loss of consciousness, and epilepsy signs such as limb jerking, auras and absences.

2. The person who has had a seizure while asleep must stop driving for 1 year from the date of the seizure unless point 3 or 5 apply.

3. Relicensing may be granted if the person, over the course of at least 1 year from the date of the first sleep seizure, establishes a history or pattern of seizures occurring only ever while asleep.

4. Relicensing may be granted if the person, over the course of at least 1 year from the date of the first seizure, establishes a history or pattern of seizures which affect neither consciousness nor cause any functional impairment. The person must never have experienced any other type of unprovoked seizure.

5. Regardless of preceding seizure history, if a person establishes a pattern of asleep seizures only (all seizures had onset during sleep), starting at least 3 years prior to licence application and there have been no other unprovoked seizures during those 3 years, a licence may be issued.

Overriding all of the above considerations is that the licence holder or applicant with epilepsy must not be regarded as a likely source of danger to the public while driving and that they are compliant with their treatment and follow up.

If the licensed driver has any epileptic seizure, they must stop driving immediately unless DVLA has established that considerations 3, 4 or 5 can be met, and they must notify DVLA.

If a licence is issued under considerations 3, 4 or 5 and the driver has a different type of seizure, they lose the concession, must stop driving, and must notify DVLA.

Isolated seizures

An isolated seizure is an unprovoked seizure experienced by a person who has not had any other unprovoked seizures during the preceding 5 years. A person who has an isolated seizure will qualify for a driving licence if they are free from any further seizure for 6 months, unless there are clinical factors or results of investigations suggesting an underlying causative factor that may increase the risk of a further seizure, in which case 12 months is required before relicensing.

Withdrawal of epilepsy medication (also see Appendix B)

Individuals should not drive whilst anti-epilepsy medication is being withdrawn and for 6 months after the last dose.

For a driver with epilepsy, if a seizure occurs within 6 months of, and because of a documented physician-advised substitution, reduction or withdrawal of anti-epilepsy medication, the regulations allow relicensing prior to the usual 12 month post-seizure period. Earlier relicensing may be considered if previously effective medication has been reinstated for at least 6 months and the driver has remained seizure free for at least 6 months.
Group 2 bus and lorry

Drivers of buses and lorries must satisfy all of the following conditions under the regulations. They must:

■ hold a full ordinary driving licence
■ have been free of epileptic seizures for the last 10 years
■ not have taken any medication to treat epilepsy during these 10 years (there are thus no special considerations for withdrawal)
■ have no continuing increased risk of epileptic seizures
■ not be a source of danger whilst driving

Isolated seizure

Drivers of buses and lorries must satisfy all the following conditions in relation to an isolated seizure. They must:

■ hold a full ordinary driving licence
■ have been free of epileptic attacks for the last 5 years
■ not have taken any medication to treat epilepsy or a seizure during these 5 years
■ have undergone a recent assessment by a neurologist
■ have no continuing increased risk of seizures

Transient loss of consciousness (‘blackouts’) – or lost/altered awareness

Transient loss of consciousness (TLoC) or ‘blackout’ is very common – it affects up to half the population in the UK at some point in their lives. An estimated 3% of A&E presentations and 1% of hospital admissions are due to TLoC.

Road traffic collisions resulting from blackouts are two or three times more common than those resulting from seizures.

Recurrent TLoC (more than one isolated event), not including syncope, is uncommon – but always requires detailed medical assessment.

There are several causes of transient loss of consciousness:

- **Syncope**
  - See syncope
- **Seizure/epilepsy**
  - See epilepsy
- **Hypoglycaemia**
  - See diabetes
- **Drug/alcohol**
  - See drug/alcohol
- **Sleep disorders**
  - See excessive sleepiness
- **Undetermined**
  - See syncope
- **Medication**
  - See medications
In relation to TLoC, 3 features are of note to medical practitioners:
- provocation
- posture
- prodrome

In relation to road safety, however, the 2 most important features are:
- prodrome – are there warning symptoms sufficient in both nature and duration?
- posture – do the episodes of TLoC occur while sitting?

A prodrome must allow time for a driver to find a safe place to stop before losing consciousness. A prodrome is reliable if the signs are clear, consistent across all events and provide sufficient duration to find a safe stop, or unreliable if these are absent.

Licence holders or applicants should be informed that they must notify DVLA when TLoC occurs while sitting.

For syncope occurring while standing or sitting, the following factors indicate high risk:
- abnormal ECG
- clinical evidence of structural heart disease

Further investigations such as 48-hour ambulatory ECG, echocardiography and exercise testing may be indicated after specialist opinion has been sought.

</tbody>
</table>
Chapter 01: Neurological disorders

Blackout with seizure markers

This category is for those where on the balance of probability there is clinical suspicion of a seizure but no definite evidence. Individuals will require assessment by an appropriate specialist and investigation, for example EEG and brain scan, where indicated.

The following factors indicate a likely seizure:
- loss of consciousness for more than 5 minutes
- amnesia longer than 5 minutes
- injury
- tongue biting
- incontinence
- post ictal confusion
- headache post attack

While standing or sitting

- Must stop driving and notify DVLA. 6 months off driving from the date of the episode.
  If there are factors that may lead to an increased risk of recurrence, 1 year off driving would be required.

- Must stop driving and notify DVLA. 5 years off driving from the date of the episode.

Transient loss of consciousness – recurring episodes

Recurrent episodes of TLoC are less common than isolated episodes but the relevance to increased risk in driving cannot be overemphasised.

Recurrent TLoC is most commonly due to recurrent syncope, occurring in around 20% to 30% of patients. Recurrence of syncope is usually within 3 years of the first episode, and in over 80% of these cases there has been at least one additional episode within 2 years of the first episode.

In relation to road safety however, the 2 most important features of temporary loss of consciousness are:
- prodrome – are there warning signs sufficient in both nature and duration?
- posture – do the episodes of TLoC occur while sitting?

A prodrome must allow time for a driver to find a safe place to stop before losing consciousness. A prodrome is reliable if the signs are clear, consistent across all events and provide sufficient duration to find a safe stop, or unreliable if these are absent.

Recurrent pre-syncopal events should be treated (from a licensing point of view) in the same way as recurrent syncope and should therefore be categorised according to the standards for recurrent syncope.

Licence holders or applicants should be informed that they must notify DVLA when transient loss of consciousness occurs while sitting.
Chapter 01: Neurological disorders

**Cough syncope**

Having experienced an episode or episodes of cough syncope, a person has identified themselves as being in a higher risk group that is predisposed to cough syncope. Therefore, even if the cough syncope episode occurred during a short-lived period of increased cough (such as an episode of acute respiratory infection), this would not alter the fact that the person is then at a higher risk of experiencing an episode of cough syncope whenever they cough, regardless of the cause.

Treatment, management or resolution of the condition which caused the cough does not reduce the risk of syncope with further episodes of cough.

Cerebral amyloid angiopathy-related transient focal neurologic episodes (previously termed “amyloid spells”)

CAA-related transient focal neurological episodes (TFNE) are usually recurrent, stereotyped attacks of unilateral spreading symptoms including paraesthesia, numbness, or weakness (alone or in combination), lasting less than 10 minutes. In the vast majority of cases, TFNE are associated with either convexal sub-arachnoid haemorrhage (cSAH), cortical superficial siderosis (the chronic form of cSAH), or both.

</table>

## Brain tumours

The standards will apply to first occurrence, recurrence and progression.

Section 1 classifies the different tumour types into 4 groups:
- very low risk primary brain tumours
- low risk primary brain tumours
- high risk primary brain tumours
- metastatic cerebral disease, primary and secondary lymphoma, and non-Central Nervous System (CNS) tumours invading intracranially and breaching the dura

The risk refers to seizure risk and/or risk of recurrence and also the risk of deterioration.

Section 2 then provides the medical standards of fitness to drive for Group 1 licensing (cars and motorcycles) and Group 2 licensing (lorries and buses) for each of these 4 groups.

The standards for acoustic neuroma/schwannoma, pituitary tumours and arachnoid and colloid cysts are detailed elsewhere.

In individuals where there are mixed grades of tumours and/or two types of therapy, the higher standard (longer time off driving) will apply.

When a tumour or its treatment is being monitored with imaging, this should usually demonstrate an absence of progression or deterioration.

Pineal tumours have been categorised as infratentorial in the classification table. DVLA acknowledges these tumours are not anatomically considered to be infratentorial. It was concluded this classification best reflected the risk of seizures and potential effect on driving of this tumour type.

---

continued
If the tumour has been associated with seizures, please refer to the seizure guidelines within Assessing Fitness to Drive: A guide for medical professionals, which will apply in addition to the standards listed in this document. A brain tumour is generally considered to be an underlying risk factor that increases risk of further seizures, and a longer time off driving will be applied. Licensing is dependent on there being no residual impairment likely to affect safe driving, for example, debarring hemianopia or cognitive impairment.

### Section 1 – Classification of tumour

<table>
<thead>
<tr>
<th>Classification</th>
<th>Brain tumours</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Very low risk</strong>&lt;br&gt; (0-6 months off driving for Group 1)</td>
<td><strong>Supratentorial</strong>&lt;br&gt; - WHO Grade 1 meningioma, without seizures or any persisting neurological impairment that would affect driving.&lt;br&gt; - Asymptomatic, diagnosed or suspected low-grade tumours identified on imaging which are being monitored only and not treated or biopsied.</td>
</tr>
<tr>
<td></td>
<td><strong>Infratentorial</strong>&lt;br&gt; - Meningiomas (WHO Grade 1 and 2)&lt;br&gt; - WHO Grade 1 glioma&lt;br&gt; - WHO Grade 1 glioneuronal tumour&lt;br&gt; - WHO Grade 1 haemangioblastoma&lt;br&gt; - Subependymoma&lt;br&gt; - Ependymomas&lt;br&gt; - IDH mutant WHO Grade 2 and 3 Gliomas&lt;br&gt; - Pineocytoma&lt;br&gt; - Germinoma, pineal parenchymal tumours of indeterminate differentiation and papillary tumours of the pineal region&lt;br&gt; - Asymptomatic, diagnosed or suspected low-grade tumours identified on imaging which are being monitored only and not treated or biopsied</td>
</tr>
<tr>
<td><strong>Low risk</strong>&lt;br&gt; (1 year off driving for Group 1)</td>
<td><strong>Supratentorial</strong>&lt;br&gt; - WHO Grade 1 meningioma associated with seizure&lt;br&gt; - WHO Grade 2 meningioma&lt;br&gt; - WHO Grade 1 Glioma or glioneuronal tumour&lt;br&gt; - IDH mutant WHO Grade 2 and Grade 3 glioma (astrocytoma and oligodendroglioma) except IDH mutant astrocytoma with the CDKN2A/B homozygous deletion&lt;br&gt; - Ependymoma except RELA fusion positive ependymomas (please see high risk)</td>
</tr>
<tr>
<td></td>
<td><strong>Infratentorial</strong>&lt;br&gt; - PNET&lt;br&gt; - Medulloblastoma&lt;br&gt; - Pineoblastoma</td>
</tr>
</tbody>
</table>

---

continued
Supratentorial
- IDH wild type WHO Grade 2 and 3 astrocytoma
- IDH mutant Grade 4 astrocytoma
- IDH mutant Grade 2 or 3 astrocytoma with the CDKN2A/B homozygous deletion
- Glioblastoma/Gliosarcoma
- Diffuse Midline Glioma
- PNET
- WHO Grade 3 or malignant (anaplastic) meningioma
- RELA fusion positive ependymoma

Infratentorial
- WHO Grade 4 astrocytoma
- IDH wild type WHO Grade 2 and 3 astrocytoma
- Diffuse Midline Glioma
- WHO Grade 3 or malignant (anaplastic) meningioma

Brain Metastases
Primary and Secondary CNS lymphoma
Non-CNS tumours invading intracranially and breaching the dura

Standards apply to first occurrence and any cerebral recurrence but not to recurrence elsewhere in the body.

Management | Group 1 licensing | Group 2 licensing
--- | --- | ---
Molecular targeted therapy/immunotherapy | Must not drive and must notify DVLA. The licence will be refused or revoked. Driving must stop until at least 1 year after the completion of the primary surgery or targeted radiotherapy (or 1 year after starting immunotherapy or molecular targeted therapy if no other primary treatment for the intracranial disease has been given). Provided there is clinical and imaging evidence of disease stability or improvement, with no deterioration intracranially, a return to driving can then be considered. | Must not drive and must notify DVLA. Driving must stop until at least 5 years after the completion of the primary surgery or targeted radiotherapy (or 5 years after starting the molecular targeted therapy or immunotherapy if no other primary treatment for the intracranial disease has been given). Provided there is clinical and imaging evidence of disease stability or improvement, with no deterioration intracranially, a return to driving can then be considered after 5 years. If these criteria cannot be met the Group 2 licence will be permanently revoked.

Acoustic neuroma/schwannoma

Group 1 car and motorcycle | Group 2 bus and lorry
--- | ---
⚠️ May drive and need not notify DVLA unless there is sudden and disabling giddiness. | ⚠️ May drive and need not notify DVLA unless there is sudden and disabling giddiness and/or the condition is bilateral.

Brain biopsy

Group 1 car and motorcycle | Group 2 bus and lorry
--- | ---
⚠️ Must not drive and must notify DVLA. Relicensing may be considered after 6 months if the biopsy shows insignificant (from a licensing perspective) histology and if there is no debarring residual impairment likely to affect safe driving. If a tumour is diagnosed on biopsy please refer to the relevant tumour standard. | ⚠️ Must not drive and must notify DVLA. Relicensing may be considered after a minimum of 6 months depending on individual assessment of the underlying condition and if the biopsy shows insignificant (from a licensing perspective) histology. If a tumour is diagnosed on biopsy please refer to the relevant tumour standard.
# Traumatic brain injury

<table>
<thead>
<tr>
<th>Group 1</th>
<th>Group 2</th>
</tr>
</thead>
<tbody>
<tr>
<td>car and motorcycle</td>
<td>bus and lorry</td>
</tr>
<tr>
<td>Must not drive but may need to notify DVLA. Relicensing may be considered usually after 6 to 12 months dependent on features such as seizures, post-traumatic amnesia more than 24 hours, dural tear, haematoma and/or contusions seen on CT imaging. There will need to have been satisfactory clinical recovery and in particular no visual field defects or cognitive impairment likely to affect safe driving. Driving can resume on recovery and DVLA need not be notified if all of the following can be satisfied: ■ there is full clinical recovery ■ there are no seizures (other than an immediate seizure at the moment of impact) ■ there is no post traumatic amnesia lasting more than 24 hours ■ there is no intracranial haematoma and/or contusions seen on CT imaging (a small traumatic subarachnoid haemorrhage in isolation would be acceptable)</td>
<td>Must not drive and must notify DVLA. The licence will be refused or revoked. Drivers may relicensed after the annual risk of seizure has fallen to 2% or below and provided no debarring residual impairment is likely to affect safe driving. The Advisory Panel has suggested that by five years, and sometimes after 2 or 3 years following a head injury, when there has been a full recovery with no residual functional deficit likely to affect safe driving, licensing can usually be permitted for Group 2. Relicensing can be reconsidered after 3 months if all of the following can be satisfied: ■ there is full clinical recovery ■ there are no seizures (other than an immediate seizure at the moment of impact) ■ there is no post traumatic amnesia lasting more than 24 hours ■ there is no intracranial haematoma and/or contusions seen on CT imaging If there has been a small subarachnoid haemorrhage but the bullet points above can otherwise be satisfied, and there is documented evidence of a full clinical recovery, driving may resume after 6 months.</td>
</tr>
</tbody>
</table>
Subdural haematoma

With any procedure, if another one is also undertaken (for example a ventriculoperitoneal shunt, and a craniotomy for a haematoma), the standards for that procedure also apply, and may take precedence.

- Must not drive and must notify DVLA.
- Driving may resume on clinical confirmation of recovery and, if no other cause has been identified, documented normal cerebrovascular imaging.
- Must not drive and must notify DVLA.
- Relicensing may be considered after 6 months provided comprehensive cerebrovascular imaging is normal, if no other cause has been identified, and no debarring residual impairment is likely to affect safe driving.

### With intracranial aneurysm

#### Intervention not currently needed

- Must not drive and must notify DVLA.
- Relicensing may be considered after 6 months if there is no debarring residual impairment likely to affect safe driving.
- Must not drive and must notify DVLA.
- The licence will be refused or revoked permanently.

### With intracranial aneurysm – non-middle cerebral artery

#### Treated by craniotomy

- Must not drive but need not notify DVLA.
- Driving may resume following clinical recovery.
- Must not drive and must notify DVLA.
- Relicensing may be considered after 1 year if the patient scored below 2 on the modified Rankin Scale (MRS) at 2 months.
- If the MRS score is 2 or higher at 2 months, relicensing will not be considered until after 2 years, and will require no debarring residual impairment likely to affect driving.

#### Treated endovascularly

- Must not drive but need not notify DVLA.
- Driving may resume following clinical recovery.
- Must not drive and must notify DVLA.
- Relicensing may be considered after 6 months if the patient scored below 2 on the modified Rankin Scale (MRS) at 2 months.
- If the MRS score is 2 or higher at 2 months, relicensing will not be considered until after 2 years, and will require no debarring residual impairment likely to affect driving.

Cavernous malformation

Cavernomas are also known as cavernous malformations, cavernous angiomas, or cavernous haemangiomas. They are all surrounded by haemosiderin on brain MRI, but this does not necessarily imply that they have ‘bled’ in the past. The risk of events that might affect driving differs according to cavernoma location (brainstem vs. other locations) and symptoms attributable to the cavernoma (stroke vs. epileptic seizure vs. no symptoms).

A person’s age, the number of cavernomas, and the size of the cavernoma do not seem to affect these risks. With multiple cavernomas, licensing restrictions differ according to cavernoma location, symptoms, or treatment. The most restrictive guidance will apply.

Might be allowed to drive subject to medical advice and/or notifying DVLA

Must not drive

May drive and need not notify DVLA
Chapter 02: Cardiovascular disorders

Angina – to include INOCA (ischaemia with non-obstructive arteries)

<table>
<thead>
<tr>
<th>Group 1</th>
<th>Group 2</th>
</tr>
</thead>
<tbody>
<tr>
<td>car and motorcycle</td>
<td>bus and lorry</td>
</tr>
</tbody>
</table>

**Angina**
- Must not drive when symptoms occur:
  - at rest
  - with emotion
  - at the wheel
- Driving may resume after satisfactory symptom control.
- Need not notify DVLA.

**Must notify DVLA. Must not drive when symptoms occur.**
- A licence will be refused or revoked if symptoms continue (treated or untreated).
- May be relicensed/licensed (provided there is no other disqualifying condition) if:
  - no angina for at least 6 weeks
  - the requirements for exercise or other functional tests can be met (see Appendix C)

Acute coronary syndrome (ACS) – to include type 1 and type 2 myocardial infarction, MINOCA (myocardial infarction with non-obstructive coronary arteries) and Takotsubo cardiomyopathy

<table>
<thead>
<tr>
<th>Group 1</th>
<th>Group 2</th>
</tr>
</thead>
<tbody>
<tr>
<td>car and motorcycle</td>
<td>bus and lorry</td>
</tr>
</tbody>
</table>

**Must not drive but need not notify DVLA.**
- Driving may resume 1 week after ACS if successful coronary intervention (PCI) has been carried out and if all of the following are met:
  - no other urgent revascularisation planned (urgent means within 4 weeks of acute event)
  - LV ejection fraction is at least 40% before hospital discharge
  - there is no other disqualifying condition
- If not treated by successful coronary intervention or any of the above are not met, driving may resume only after 4 weeks from the acute event, provided there is no other disqualifying condition.

**Must not drive and must notify DVLA – for all ACS.**
- Licence will be refused or revoked.
- May be relicensed/licensed after at least 6 weeks if:
  - the requirements for exercise or other functional tests can be met (see Appendix C)
  - LV ejection fraction is at least 40%
  - there is no other disqualifying condition
- No functional cardiac test is required in Takotsubo cardiomyopathy in the absence of known coronary artery disease.

Note: DVLA bars Group 2 bus and lorry licensing whenever left ventricular ejection fraction is less than 40%
### Elective percutaneous coronary intervention (PCI)

<table>
<thead>
<tr>
<th>Group 1</th>
<th>Group 2</th>
</tr>
</thead>
<tbody>
<tr>
<td>car and motorcycle</td>
<td>bus and lorry</td>
</tr>
</tbody>
</table>

- **Must not drive for at least 1 week but need not notify DVLA.** Driving may resume after 1 week provided there is no other disqualifying condition.

- **Must not drive and must notify DVLA.** Licence will be refused or revoked. May be re-licensed/licensed after at least 6 weeks if:
  - LV ejection fraction is at least 40%
  - the requirements for exercise or other functional tests can be met (see Appendix C)
  - there is no other disqualifying condition

### Coronary artery bypass graft (CABG)

<table>
<thead>
<tr>
<th>Group 1</th>
<th>Group 2</th>
</tr>
</thead>
<tbody>
<tr>
<td>car and motorcycle</td>
<td>bus and lorry</td>
</tr>
</tbody>
</table>

- **Must not drive for at least 4 weeks but need not notify DVLA.** Driving may resume after 4 weeks provided there is no other disqualifying condition.

- **Must not drive and must notify DVLA.** Licence will be refused or revoked. May be re-licensed/licensed after at least 3 months if:
  - LV ejection fraction is at least 40%
  - the requirements for exercise or other functional tests can be met (see Appendix C), at least 3 months postoperatively
  - there is no other disqualifying condition

### Coronary artery disease

For Group 2 licensing, if there is evidence of obstructive coronary artery disease on invasive or CT angiography or myocardial ischaemia on functional testing but it does not fall under any of the categories above, those individuals would need to meet the functional test requirements.

---

*Note: DVLA bars Group 2 bus and lorry licensing whenever left ventricular ejection fraction is less than 40%*

Chapter 02: Cardiovascular disorders

Implantable cardioverter defibrillator (ICD)

**Group 1 car and motorcycle**

In all cases of ICD implanted for sustained ventricular arrhythmia associated with incapacity, **driving must stop** for 6 months from the date of ICD implantation and any resumption requires:

- the device being under regular review with interrogation
- no other disqualifying condition
- all the requirements as below must be met

**Group 2 bus and lorry**

ICD implantation is a permanent bar to Group 2 licensing. In all cases of ICD implantation (including prophylactic ICD implantation) driving must stop permanently and:

- DVLA must be notified
- the licence will be refused or revoked permanently

<table>
<thead>
<tr>
<th>Group 1 car and motorcycle</th>
<th>Group 2 bus and lorry</th>
</tr>
</thead>
<tbody>
<tr>
<td>ICD implanted for sustained ventricular arrhythmia associated with incapacity</td>
<td></td>
</tr>
</tbody>
</table>

### Without further sequelae

- Must not drive and must notify DVLA.
  - Driving may resume after 6 months following implantation – except that any of the sequelae 1-3 below require further specific restrictions and may require notification to DVLA.

### 1. With any shock therapy, and/or anti-tachycardia pacing associated with incapacity or likely to cause incapacity (whether incapacity caused by device or arrhythmia)

- If therapy delivery was due to an inappropriate cause such as atrial fibrillation or programming issues driving may resume 1 month after complete control of any cause to the satisfaction of the cardiologist, and DVLA need not be notified.
  - If therapy delivery was appropriate due to sustained ventricular tachycardia or ventricular fibrillation, DVLA must be notified and driving may resume 6 months after the event provided:
    - preventive steps against recurrence have been taken with anti-arrhythmic drugs, an ablation procedure, or ICD programming alteration and

- Must not drive and must notify DVLA.
  - Licence will be refused or revoked permanently.

Note: DVLA bars Group 2 bus and lorry licensing whenever left ventricular ejection fraction is less than 40%
### Cardiovascular disorders

**Table 2.1: Driving Restrictions for Various Conditions**

<table>
<thead>
<tr>
<th>Condition Description</th>
<th>Group 1 car and motorcycle</th>
<th>Group 2 bus and lorry</th>
</tr>
</thead>
<tbody>
<tr>
<td>■ there is an absence of further shock therapy and/or anti-tachycardia pacing associated with incapacity or likely to cause incapacity</td>
<td>Otherwise, must not drive for 2 years and must notify DVLA.</td>
<td></td>
</tr>
</tbody>
</table>

**Section 2. With any revision of electrodes or anti-arrhythmic drug treatment**

- Must not drive for 1 month but need not notify DVLA.
- Driving may resume 1 month after electrode revision or drug alteration provided there is no other disqualifying condition.

**Section 3. With defibrillator box change**

- Must not drive for 1 week but need not notify DVLA.
- Driving may resume 1 week after box change provided there is no other disqualifying condition.

**ICD implanted for sustained ventricular arrhythmia not associated with incapacity**

- Must not drive for 1 month following implantation and must notify DVLA.
- Driving may resume 1 month after implantation provided all of the following are met:
  - presentation was a ‘non-disqualifying’ cardiac event – i.e. haemodynamically stable sustained ventricular tachycardia without incapacity
  - LV ejection fraction is greater than 35%
  - any VT induced on electrophysiological study has RR interval greater than 250 milliseconds
  - during the post implantation electrophysiological study, any induced VT could be pace-terminated by the ICD twice, without acceleration
- If any of the above not met, must not drive for 6 months following implantation.

- Must not drive and must notify DVLA.
- Licence will be refused or revoked permanently.

**Note:** DVLA bars Group 2 bus and lorry licensing whenever left ventricular ejection fraction is less than 40%
### Prophylactic ICD

**In asymptomatic individuals with a high risk of significant arrhythmia**

- Must not drive for 1 month following implantation and must notify DVLA:
  - driving may resume 1 month after implantation if remains asymptomatic and no ICD therapy needed
  - should the ICD subsequently deliver shock therapy and/or anti-tachycardia pacing associated with or likely to cause incapacity (except during normal clinical testing), DVLA must be notified and relevant restrictions must be applied as detailed under the heading ‘ICD implanted for sustained ventricular arrhythmia associated with incapacity.’

For the purposes of this guidance ‘incapacity’ is defined as any condition, symptom or treatment that is likely to cause an individual to be unable to safely control or stop a vehicle.

- Must not drive and must notify DVLA.
  - Licence will be refused or revoked permanently.
  - For the purposes of this guidance ‘incapacity’ is defined as any condition, symptom or treatment that is likely to cause an individual to be unable to safely control or stop a vehicle.

---

*Note: DVLA bars Group 2 bus and lorry licensing whenever left ventricular ejection fraction is less than 40%*
# Aortic aneurysm

-- ascending or descending thoracic and/or abdominal

All patients must have regular medical review.
Note: for Group 2 cases, the exercise or other functional test requirements will need to be met in all cases of abdominal aortic aneurysm.

<table>
<thead>
<tr>
<th>Aortic aneurysm (see separate standards for people with bicuspid aortopathy or Marfan’s syndrome)</th>

<th>Group 2</th>
</tr>
</thead>
<tbody>
<tr>
<td>car and motorcycle</td>
<td>bus and lorry</td>
</tr>
</tbody>
</table>

- May drive and need not notify DVLA. There must be no other disqualifying condition.
- May drive but must notify DVLA. May be relicenced/licensed only if:
  - there is no symptomatic myocardial ischemia, and
  - the exercise or other functional test requirements can be met (see Appendix C)

Hypertension

<table>
<thead>
<tr>
<th>Group 1</th>
<th>Group 2</th>
</tr>
</thead>
<tbody>
<tr>
<td>car and motorcycle</td>
<td>bus and lorry</td>
</tr>
</tbody>
</table>

- May drive and need not notify DVLA, except:
  - Must not drive if diagnosed with malignant hypertension until condition has been effectively treated or controlled but need not notify DVLA.
  - Malignant hypertension: elevation in systolic blood pressure greater than or equal to 180 mm Hg or diastolic blood pressure greater than 110 mm Hg associated with evidence of progressive organ damage.
- May drive and need not notify DVLA, except:
  - Must not drive and must notify DVLA if resting BP is consistently:
    - 180mm Hg or higher systolic and/or
    - 100mm Hg or more diastolic
    - or if diagnosed with malignant hypertension
  - May be relicensed/licensed after BP is controlled, provided there are no side-effects from treatment that affect or are likely to affect safe driving.

Cardiomyopathies

Note: DVLA bars Group 2 bus and lorry licensing whenever left ventricular ejection fraction is less than 40%.

Also refer to the following sections in this document:
- arrhythmia
- pacemaker implant
- implantable cardioverter defibrillator

<td>bus and lorry</td>
</tr>
</tbody>
</table>

## Hypertrophic cardiomyopathy (HCM)

### Asymptomatic
- May drive and need not notify DVLA.
  - There must be no other disqualifying condition.
  - Must not drive and must notify DVLA. Must not drive if in the High Risk group (as per ESC HCM Risk-SCD calculator – see Appendix C for details) and/or if ICD is indicated/implanted. If in the Low Risk or Intermediate Risk group licensing will be permitted if the applicant is able to complete the full 9 minutes of the standard exercise tolerance test (or energy equivalent using a cycle ergometer) (see Appendix C for details). Should the applicant be unable to exercise for non-cardiovascular reasons cardiac MRI imaging must not reveal more than 15% of ventricular myocardium demonstrating gadolinium enhancement.

### Symptomatic
- May drive and need not notify DVLA.
  - There must be no other disqualifying condition (must meet all other relevant standards e.g. angina, arrhythmia).
  - Must not drive and must notify DVLA. Licence will be refused or revoked. Relicensing will be considered once symptoms are satisfactorily controlled and the criteria for asymptomatic HCM met as detailed above. If there is a history of associated syncope the standards for syncope need to be met in addition.

## Dilated cardiomyopathy

### Asymptomatic
- May drive and need not notify DVLA.
  - There must be no other disqualifying condition.
  - May drive but must notify DVLA. LV ejection fraction must be at least 40% and there must be no other disqualifying condition.

### Symptomatic
- May drive and need not notify DVLA.
  - There must be no other disqualifying condition (must meet all other standards e.g. angina arrhythmia).
  - Must not drive and must notify DVLA. Licence may be issued/renewed once asymptomatic, if LV ejection fraction is at least 40% and there is no other disqualifying condition.

## Arrhythmogenic right ventricular cardiomyopathy and allied disorders

### Asymptomatic
- May drive and need not notify DVLA.
  - Must not drive and must notify DVLA. May be relicensed/licensed following specialist electrophysiological assessment, provided there is no other disqualifying condition.

---

Note: DVLA bars Group 2 bus and lorry licensing whenever left ventricular ejection fraction is less than 40%

---

Notes:
- **DVLA bars Group 2 bus and lorry licensing whenever left ventricular ejection fraction is less than 40%**
- **NYHA classification**: NYHA (New York Heart Association) classification is a system used to grade the severity of heart failure. It is based on symptoms and physical examination. The classification ranges from NYHA class I (mild or no symptoms) to NYHA class IV (actively incapacitated).
Chapter 02: Cardiovascular disorders

New York Heart Association (NYHA) Classification of heart failure
The New York Heart Association (NYHA) classification is used to grade the severity of functional limitations in a patient with heart failure (1):

- **class I** no limitation of physical activity
  - ordinary physical activity does not cause fatigue, breathlessness or palpitation (includes asymptomatic left ventricular dysfunction)
- **class II** slight limitation of physical activity
  - patients are comfortable at rest. Ordinary physical activity results in fatigue, palpitation, breathlessness or angina pectoris (symptomatically ‘mild’ heart failure)
- **class III** marked limitation of physical activity
  - although patients are comfortable at rest, less than ordinary activity will lead to symptoms (symptomatically ‘moderate’ heart failure)
- **class IV** inability to carry out any physical activity without discomfort
  - symptoms of congestive cardiac failure are present even at rest. Increased discomfort with any physical activity (symptomatically ‘severe’ heart failure)

Cardiac resynchronisation therapy (CRT)

<table>
<thead>

Note: DVLA bars Group 2 bus and lorry licensing whenever left ventricular ejection fraction is less than 40%
# Cardiovascular disorders

## Symptomatic

- Must not drive and must notify DVLA. Symptoms include angina, palpitations, dyspnoea, symptoms related to uncontrolled hypertension, heart failure, heart valve disease. For patients with congenital heart disease who have had ablation, pacemaker including CRT, ICD, heart valve intervention (surgical or percutaneous) or percutaneous cardiac/pulmonary devices (ASD/VSD/coarctation/MAPCAs/pulmonary-systemic shunts etc) – if symptoms develop after being asymptomatic or if they fall under any other category which requires notification to DVLA, must notify DVLA. Individual assessment of symptomatic cases. DVLA may require specialist assessment to issue a licence, which may be subject to medical review at 1, 2, or 3 years. There must be no other disqualifying condition.

- Must not drive and must notify DVLA. Licence will be refused or revoked if CHD is severe*. Otherwise, following individual assessment of cases, DVLA may issue a licence subject to medical review at 1, 2 or 3 years, depending on specialist assessment and provided there is:
  - mild/moderate disease*
  - successful cardiac or pulmonary intervention (percutaneous device or surgery)
  - no other disqualifying condition

*See classification of congenital heart disease complexity and the section in Appendix C.

For syncope, refer to Chapter 1

- Transient loss of consciousness

## ECG abnormality

Diabetes mellitus

Information sent to drivers

Insulin-treated drivers are sent a detailed letter from DVLA explaining the licensing requirements and driving responsibilities. (see INF294 Appendix D).

All drivers with diabetes must follow the information provided in ‘Information for drivers with diabetes’, which includes a notice of when they must contact DVLA (see Appendix D).

Insulin-treated diabetes

Adequate awareness of hypoglycaemia

The Secretary of State’s Honorary Medical Advisory Panel on Driving and Diabetes has defined adequate awareness of hypoglycaemia as whether ‘the licence holder/applicant [is] capable of bringing their vehicle to a safe controlled stop’.

This is a matter of professional judgement and as a guide the duration of hypoglycaemic symptoms experienced should be compatible with bringing a vehicle to a safe controlled stop.

The reliance on alarms on glucose monitoring devices are not accepted as a substitute for adequate symptomatic or physiological awareness of hypoglycaemia experienced by the driver.

Should a driver become reliant on these alarms to advise them that they are hypoglycaemic they must stop driving and notify DVLA.

Impaired awareness of hypoglycaemia

The Panel has also defined impaired awareness of hypoglycaemia for Group 1 drivers as ‘an inability to detect the onset of hypoglycaemia because of total absence of warning symptoms’.

Group 2 drivers must have full awareness of hypoglycaemia.

Severe hypoglycaemia

The law defines ‘severe’ as an episode of hypoglycaemia requiring the assistance of another person.

Group 1 drivers – episodes of hypoglycaemia occurring during established sleep are no longer considered relevant for licensing purposes unless there are concerns regarding their hypoglycaemia awareness.

Group 2 drivers – must report all episodes of severe hypoglycaemia requiring the assistance of another person.

Interstitial glucose monitoring systems

These devices are more widely known as flash glucose monitoring systems (Flash GM) and real-time continuous glucose monitoring systems (RT-CGM).

continued
Chapter 03: Diabetes mellitus

Group 1
These systems may be used for monitoring glucose at times relevant to driving Group 1 vehicles. Users of these systems must carry finger prick capillary glucose testing equipment for driving purposes as there are times when a confirmatory finger prick blood glucose level is required.

If using an interstitial fluid continuous glucose monitoring system (Flash GM or RT-CGM), the blood glucose level must be confirmed with a finger prick blood glucose reading in the following circumstances:

- when the glucose level is 4.0 mmol/L or below
- when symptoms of hypoglycaemia are being experienced
- when the glucose monitoring system gives a reading that is not consistent with the symptoms being experienced (for example symptoms of hypoglycaemia and the system reading does not indicate this) – see the INF294 leaflet in Appendix D for further details

Group 2
There is a legal requirement for Group 2 drivers to monitor their blood glucose for the purpose of Group 2 driving.

Flash GM and RT-CGM interstitial fluid glucose monitoring systems are not permitted for the purposes of Group 2 driving and licensing.

Group 2 drivers who use these devices must continue to monitor finger prick capillary blood glucose levels with the regularity defined below.

⚠️ Must meet the criteria to drive and must notify DVLA.

- All the following criteria must be met for DVLA to license the person with insulin-treated diabetes for 1, 2 or 3 years:
  - adequate awareness of hypoglycaemia
  - no more than 1 episode of severe hypoglycaemia while awake in the preceding 12 months and the most recent episode occurred more than 3 months ago (see recurrent severe hypoglycaemia guidance below).
  - practises appropriate glucose monitoring as defined in the box below
  - not regarded as a likely risk to the public while driving
  - meets the visual standards for acuity and visual field (see Chapter 6, visual disorders)
  - under regular review

⚠️ Must meet the criteria to drive and must notify DVLA.

- All the following criteria must be met for DVLA to license the person with insulin-treated diabetes for 1 year (with annual review as indicated last below):
  - full awareness of hypoglycaemia
  - no episode of severe hypoglycaemia in the preceding 12 months
  - practises blood glucose monitoring with the regularity defined in the box below.
  - must use a blood glucose meter with sufficient memory to store 6 weeks of readings as detailed below
  - demonstrates an understanding of the risks of hypoglycaemia
  - no disqualifying complications of diabetes that would mean a licence being refused or revoked, such as visual field defect (see Chapter 6, visual disorders)
Group 1 and Group 2 requirements for insulin-treated drivers licensed on review

The Secretary of State’s Honorary Medical Advisory Panel on Driving and Diabetes has defined the glucose self-monitoring requirements for licensing as follows.

**Group 1 car and motorcycle**
- glucose testing no more than 2 hours before the start of the first journey
- every 2 hours after driving has started
- a maximum of 2 hours should pass between the pre-driving glucose test and the first glucose check performed after driving has started
- applicants will be asked to sign an undertaking to comply with the directions of the healthcare professionals treating their diabetes and to report any significant change in their condition to DVLA immediately

More frequent self-monitoring may be required with any greater risk of hypoglycaemia (physical activity, altered meal routine).

**Group 2 bus and lorry**
- regular blood glucose testing – at least twice daily including on days when not driving
- no more than 2 hours before the start of the first journey
- every 2 hours after driving has started
- a maximum of 2 hours should pass between the pre-driving glucose test and the first glucose check performed after driving has started

More frequent self-monitoring may be required with any greater risk of hypoglycaemia (physical activity, altered meal routine), in which case a bus or lorry driver may be licensed if they:
- use one or more blood glucose meters with memory functions to ensure 6 weeks of readings whilst on insulin that will be available for assessment

**How DVLA checks diabetes management requirements for insulin-treated Group 2 bus and lorry licensing**

DVLA takes the following measures to ensure the requirements are met for licensing of insulin-treated Group 2 bus and lorry drivers:
- applicants must stop driving Group 2 vehicles when they commence insulin until DVLA has made a licensing decision
- arranges an examination to be undertaken every 12 months by an independent consultant specialist in diabetes
- at the examination, the consultant will require sight of blood glucose self-monitoring records for the previous 6 weeks stored on the memory of a traditional blood glucose meter (not Continuous Glucose Monitoring System)
- the license application process cannot start until an applicant’s condition has been stable for at least 1 month, and they can provide 2 months of blood glucose readings taken whilst on insulin

continued
applicants will be asked to sign an undertaking to comply with the directions of the healthcare professionals treating their diabetes and to report any significant change in their condition to DVLA immediately

Recurrent severe hypoglycaemia guidance
Advice for Group 1 drivers who have had more than one episode of severe hypoglycaemia while awake in the last 12 months
- must not drive and must notify DVLA.
  DVLA will then carry out medical enquiries before a licensing decision is made.

Advice for Group 2 drivers after every episode of severe hypoglycaemia in the last 12 months
- must not drive and must notify DVLA following all episodes of severe hypoglycaemia.

Severe hypoglycaemia whilst driving
All Group 1 and Group 2 drivers who experience an episode of severe hypoglycaemia whilst driving must not drive and must notify DVLA.

Impaired awareness of hypoglycaemia
- ‘hypoglycaemia unawareness’

<table>
<thead>
<tr>
<th>Group 1 car and motorcycle</th>
<th>Group 2 bus and lorry</th>
</tr>
</thead>
<tbody>
<tr>
<td>● Must not drive and must notify DVLA. Driving may resume after a clinical report by a GP or consultant diabetes specialist confirms that adequate hypoglycaemia awareness has been regained.</td>
<td>● Must not drive and must notify DVLA. The licence will be refused or revoked. Refer to the requirements for insulin-treated diabetes.</td>
</tr>
</tbody>
</table>

Diabetes complications
Visual complications
- affecting visual acuity or visual field

<table>
<thead>
<tr>
<th>Group 1 car and motorcycle</th>
<th>Group 2 bus and lorry</th>
</tr>
</thead>
<tbody>
<tr>
<td>□ May need to stop driving and notify DVLA. Refer to Chapter 6, visual disorders.</td>

</tr>
</tbody>
</table>
Renal complications

Group 1
- car and motorcycle

Group 2
- bus and lorry

- May need to stop driving and notify DVLA.
  Refer to Chapter 7, renal and respiratory disorders.

Limb complications
- including peripheral neuropathy

Group 1
- car and motorcycle

Group 2
- bus and lorry

- Any complication such as peripheral neuropathy that means a driver must meet requirements (such as vehicle adaptations) for disabilities

- May need to stop driving and notify DVLA.
  See Appendix F, disabilities and vehicle adaptations.
  Limb problems or amputations are of themselves unlikely to prevent driving since they may be assisted by suitable vehicle adaptations. The ability to safely control a vehicle at all times is the essential requirement.

- May need to stop driving and notify DVLA.
  See Appendix F, disabilities and vehicle adaptations.
  Limb problems or amputations are of themselves unlikely to prevent driving since they may be assisted by suitable vehicle adaptations. The ability to safely control a vehicle at all times is the essential requirement.

Temporary insulin treatment
- including gestational diabetes or post-myocardial infarction

Group 1
- car and motorcycle

Group 2
- bus and lorry

- Trial participants for oral or inhaled insulin are also examples to be included as receiving temporary insulin treatment

- May drive and need not notify DVLA, provided:
  - under medical supervision
  - not advised by clinician as at risk of disabling hypoglycaemia

- May continue to drive but must notify DVLA if:
  - disabling hypoglycaemia occurs
  - treatment continues for more than 3 months – or in gestational diabetes, continues for 3 months after delivery

- Must notify DVLA and meet the above standards.
# Diabetes treated by medication other than insulin

## Severe hypoglycaemia

The law defines ‘severe’ as an episode of hypoglycaemia requiring the assistance of another person.

All Group 1 and Group 2 drivers who experience an episode of severe hypoglycaemia whilst driving must not drive and must notify DVLA.

### Managed by tablets carrying hypoglycaemia risk

<table>
<thead>
<tr>
<th>Group 1</th>
<th>Group 2</th>
</tr>
</thead>
<tbody>
<tr>
<td>car and motorcycle</td>
<td>bus and lorry</td>
</tr>
</tbody>
</table>

- **Including sulphonylureas and glinides (for example Repaglinide, Nateglinide)**
  - May drive and need not notify DVLA, provided:
    - no more than 1 episode of severe hypoglycaemia while awake in the last 12 months and the most recent episode occurred more than 3 months ago
    - should practise appropriate glucose monitoring at times relevant to driving
    - under regular review
  - It is appropriate to offer glucose monitoring at times relevant to driving to enable the detection of hypoglycaemia.
  - If the above requirements and those set out in [Appendix D](#) are met, DVLA need not be informed.
  - DVLA must be notified if clinical information indicates the agency may need to undertake medical enquiries.

- **May drive but must notify DVLA.**
  - All the following criteria must be met for DVLA to issue a licence for 1, 2 or 3 years:
    - **no episode** of severe hypoglycaemia in the last 12 months
    - **full awareness** of hypoglycaemia
    - regular self-monitoring of blood glucose – at least twice daily and at times relevant to driving, i.e. no more than 2 hours before the start of the first journey and every 2 hours after driving has started
    - demonstrates an understanding of the risks of hypoglycaemia
    - has no disqualifying complications of diabetes that mean a licence will be refused or revoked, such as visual field defect

### Managed by other medication. Such medication includes Metformin, DPP-4 inhibitors (gliptins), SGLT2 inhibitors, GLP-1 agonists and non-insulin injectables.

<table>
<thead>
<tr>
<th>Group 1</th>
<th>Group 2</th>
</tr>
</thead>
<tbody>
<tr>
<td>car and motorcycle</td>
<td>bus and lorry</td>

Severe hypoglycaemia due to causes other than diabetes management

Examples include hypoglycaemia post-bariatric surgery or in association with eating disorders, and the restriction applies for both car and motorcycle, and bus and lorry drivers.

Severe hypoglycaemia

The law defines ‘severe’ as an episode of hypoglycaemia requiring the assistance of another person.

If there are episodes of severe hypoglycaemia from any cause other than diabetes treatment driving must stop and the driver must notify DVLA.

<table>
<thead>

</tbody>
</table>

- Must not drive during acute illness and must notify DVLA.
- Licensing may be considered if all of these conditions are met:
  - remained well and stable for at least 3 months
  - adheres to any agreed treatment plan
  - free from any medication effects that would impair driving
  - subject to a suitable specialist report being favourable
- A lack of insight which impacts upon the ability to drive safely would be a bar to licensing.
- Drivers with a history of instability and/or poor engagement with treatment will be required not to drive for a longer period before any relicensing.

- Must not drive during acute illness and must notify DVLA.
- Licensing may be considered if all of these conditions are met:
  - remained well and stable for at least 12 months
  - adheres to any agreed treatment plan
  - free from any medication effects that would impair driving
  - subject to a favourable report from a specialist in psychiatry
- A lack of insight which impacts upon the ability to drive safely would be a bar to licensing.
- The minimum effective antipsychotic dosage should be sought, in line with good practice. Drug tolerability should be optimal and not associated with any deficits that might impair driving, such as to alertness, concentration or motor performance.
- Established illness with a history suggesting a likelihood of relapse: the risk of this needs to be considered low.
- DVLA will normally require the report of a specialist in psychiatry that specifically addresses the above issues as relevant to driving before it may grant a licence.
Hypomania or mania

Persistent alcohol and/or drug misuse or dependence

- See Chapter 5.
- If psychiatric illness has been associated with substance misuse, continued misuse contraindicates driving and licensing.

For Group 2 bus and lorry driving, in both stable and unstable conditions:

- the minimum effective dosage of any antipsychotic medication should be sought, in line with good practice. Drug tolerability should be optimal and not associated with any deficits that might impair driving, such as to alertness, concentration or motor performance
- established illness with a history to suggest a likelihood of relapse: the risk of this must be considered low

- Must not drive and must notify DVLA.
- Licensing may be considered if all of these conditions are met:
  - remained well and stable for at least 3 months
  - adheres adequately to any agreed treatment plan
  - free from any medication effects that would impair driving
  - subject to a suitable specialist report being favourable
- Continuing symptoms: even with limited insight, these do not necessarily preclude licensing.
- However a lack of insight which impacts upon the ability to drive safely would be a bar to licensing.
- Symptoms should be unlikely to cause significant concentration problems, memory impairment or distraction while driving.

- Must not drive and must notify DVLA.
- Licensing may be considered if all of these conditions are met:
  - remained well and stable for at least 12 months. A longer period of stability may be required if there is a history of relapses
  - adheres strictly to any agreed treatment plan
  - free from any medication effects that would impair driving
  - subject of a favourable report from a specialist in psychiatry
- Further:
  - the minimum effective dosage of any antipsychotic medication should be sought, in line with good practice. Drug tolerability should be optimal and not associated with any deficits that might impair driving, such as to alertness, concentration or motor performance
  - established illness with a history suggesting a likelihood of relapse: the risk of this must be considered low
- A lack of insight which impacts upon the ability to drive safely would be a bar to licensing.

continued
Considerations include:

- poor short-term memory, disorientation, and lack of insight and judgement almost certainly mean no fitness to drive
- disorders of attention cause impairment
- in early dementia, when sufficient skills are retained and progression is slow, a licence may be issued subject to annual review

A formal driving assessment may be necessary (see Appendix G).

**Learning disability**

**Definition of severe learning disability followed by DVLA**

Significantly below average general intellectual functioning, accompanied by severe limitations in adaptive functioning in at least 2 of these areas:

- communication
- self-care
- home-living
- social/interpersonal skills
- self-direction
- functional academic skills
- work
- leisure
- health and safety

- Drug misuse or dependence ............................................... 103
- Seizure associated with drug use ....................................... 105
- High-risk offenders ............................................................ 106
Chapter 05: Drug or alcohol misuse and dependence

Alcohol misuse

Guide to definition of misuse

There is no singular definition to embrace all the variables within alcohol misuse – but DVLA offers the following:

A state that causes, because of consumption of alcohol, disturbance of behaviour, related disease or other consequences likely to cause the patient, their family or society present or future harm and that may or may not be associated with dependence.

The relevant classification code for alcohol misuse is World Health Organization F10.1 (ICD-10).

<table>
<thead>
<tr>
<th>Group 1</th>
<th>Group 2</th>
</tr>
</thead>
<tbody>
<tr>
<td>car and motorcycle</td>
<td>bus and lorry</td>
</tr>
</tbody>
</table>

Persistent alcohol misuse
confirmed by medical enquiry and/or evidence of otherwise unexplained abnormal blood markers

Must not drive and must notify DVLA.
Licence will be refused or revoked until after:
- a minimum of 6 months of controlled drinking or abstinence, and
- normalisation of blood parameters

Must not drive and must notify DVLA.
Licence will be refused or revoked until after:
- a minimum of 1 year of controlled drinking or abstinence, and
- normalisation of blood parameters

Definition of controlled drinking

Drinking within government recommended health guidelines (currently 14 units per week).

Alcohol dependence

Guide to definition of dependence

There is no single definition to embrace all the variables within alcohol dependence – but DVLA offers the following:

“A cluster of behavioural, cognitive and physiological phenomena that develop after repeated alcohol use, including:
- a strong desire to take alcohol
- difficulties in controlling its use
- persistent use in spite of harmful consequences
- and with evidence of increased tolerance and sometimes a physical withdrawal state”

Indicators may include any history of withdrawal symptoms, tolerance, detoxification or alcohol-related seizures.

The relevant classification code for alcohol dependence is World Health Organization F10.2 (ICD-10).
### Chapter 05: Drug or alcohol misuse and dependence

<table>
<thead>
<tr>
<th>Group 1</th>
<th>Group 2</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Dependence confirmed by medical enquiry</strong>&lt;br&gt;Also refer to alcohol related seizure below</td>
<td><strong>Dependence confirmed by medical enquiry</strong>&lt;br&gt;Also refer to alcohol related seizure below</td>
</tr>
<tr>
<td>Must not drive and must notify DVLA.&lt;br&gt;Licence will be refused or revoked until a minimum of 1 year’s abstinence from alcohol consumption has been attained.&lt;br&gt;Continued licensing will thereafter require ongoing abstinence.</td>
<td>Must not drive and must notify DVLA.&lt;br&gt;Licence will be refused or revoked until a minimum of three years’ abstinence from alcohol consumption has been attained.&lt;br&gt;Continued licensing will thereafter require ongoing abstinence.</td>
</tr>
</tbody>
</table>

**For both driving groups:**
- Licensing will require satisfactory medical reports from a doctor
- DVLA may need to arrange independent medical examination and blood tests
- Referral to and the support of a consultant specialist may be necessary

### Alcohol-related disorders

<table>
<thead>
<tr>
<th>Group 1</th>
<th>Group 2</th>
</tr>

<td><strong>Examples</strong>&lt;br&gt;- hepatic cirrhosis with chronic encephalopathy&lt;br&gt;- alcohol induced psychosis&lt;br&gt;- cognitive impairment</td>
<td><strong>Examples</strong>&lt;br&gt;- Must not drive and must notify DVLA.&lt;br&gt;Licence will be refused or revoked until:&lt;br&gt;- recovery is satisfactory&lt;br&gt;- any other relevant medical standards for fitness to drive are satisfied (for example, Chapter 4, psychiatric disorders)</td>
</tr>
</tbody>
</table>

### Alcohol-related seizure

The relevant standards for any associated alcohol dependence should be applied. Seizures associated with alcohol use may be considered provoked in terms of licensing (for details see neurological disorders and Appendix B).
Drug misuse or dependence

The relevant classification codes for drug misuse or dependence are World Health Organization F11 to F19 inclusive (ICD-10).

The below requirements apply to cases of single-substance misuse or dependence, whereas multiple problems – including with alcohol misuse or dependence – are not compatible with fitness to drive or licensing consideration, in both groups of drivers.

<table>
<thead>

## Chapter 05: Drug or alcohol misuse and dependence

### Drug group

- Opiates (for example heroin, morphine)
- Opioids (for example codeine)
- Benzodiazepines
- Synthetic benzodiazepines
- Synthetic cannabinoids
- Methadone (note on compliance above)
- Cocaine
- Methamphetamine

### methadone/buprenorphine programmes

- Must not drive and must notify DVLA with persistent misuse or dependence.

**Group 1**

- Car and motorcycle

- Must not drive and must notify DVLA with persistent misuse or dependence.

**Medical enquiry confirming the problem will result in licence being refused or revoked for a minimum of 1 year, which must be free of misuse or dependence.**

**Relicensing may require an independent medical assessment and urine screen arranged by DVLA.**

**Must not drive and must notify DVLA with persistent misuse or dependence.**

**Medical enquiry confirming the problem will result in licence being refused or revoked for a minimum of 3 years, which must be free of misuse or dependence.**

**Relicensing will usually require an independent medical assessment and urine screen arranged by DVLA.**

### Note on methadone/buprenorphine treatment programmes

**Group 1**

Applicants or drivers complying fully with a consultant or appropriate healthcare practitioner supervised oral methadone maintenance programme may be licensed subject to favourable assessment and normally annual medical review. Applicants or drivers on an oral buprenorphine programme may be considered applying the same criteria. There should be no evidence of continuing use of other substances including cannabis.

Application may be considered when all of the following conditions can be met:

- Stable on the programme for a minimum of 1 year
- The treatment programme is supervised by a consultant or specialist GP
- The treatment is for management of opiate dependence
- Oral/sublingual treatment only (not parenteral) but subcutaneous long-acting buprenorphine or naltrexone implants may be considered
- There has been compliance with the programme (adherence to prescription and appointments, and toxicology testing with sustained stability)
- No non-prescribed psychoactive drug use during the programme or extra use of prescribed drugs such as methadone, buprenorphine, benzodiazepines
- There is no toxicological evidence of drug misuse
- There is no adverse effect from treatment likely to affect safe driving
- There is no alcohol misuse or dependence
- There should be no other disqualifying conditions (as specified in the other chapters of this guidance)
Group 2 and C1/D1

Applicants or drivers complying fully with a consultant or appropriate healthcare practitioner supervised oral methadone maintenance programme may be considered for an annual medical review licence, once a minimum 3-year period of stability on the maintenance programme has been established with favourable random urine tests and assessment. Expert panel advice will be required in each case.

Application may be considered when all of the following conditions can be met:

- stable on the programme for a minimum of 3 years
- the treatment programme is supervised by a consultant or specialist GP
- the treatment is for management of opiate dependence
- oral/sublingual treatment only (not parenteral) but subcutaneous long-acting buprenorphine or naltrexone implants may be considered
- there has been compliance with the programme (adherence to prescription and appointments, and toxicology testing with sustained stability)
- no non-prescribed psychoactive drug use during the programme or extra use of prescribed drugs such as methadone, buprenorphine, benzodiazepines
- there is no toxicological evidence of drug misuse
- there is no adverse effect from treatment likely to affect safe driving
- there is no alcohol misuse or dependence
- there should be no other disqualifying conditions (as specified in the other chapters of this guidance)

Seizure associated with drug use

Seizures associated with drug use may be considered provoked in terms of licensing (for details see neurological disorders and Appendix B).

In addition, the relevant standards for any associated drug misuse or dependence should be applied.

Relicensed drivers with former drug misuse or dependence should be advised as part of their aftercare that recurrence would mean they must stop driving and must notify DVLA.
High-risk offenders

The definition ‘high-risk offender’ applies to drivers convicted of the following:

- one disqualification for driving or being in charge of a vehicle when the level of alcohol in the body equalled or exceeded either one of these measures:
  - 87.5 mcg per 100 ml of breath
  - 200.0 mg per 100 ml of blood
  - 267.5 mg per 100 ml of urine
- two disqualifications within the space of 10 years for drink-driving or being in charge of a vehicle while under the influence of alcohol
- one disqualification for refusing or failing to supply a specimen for alcohol analysis
- one disqualification for refusing to give permission for a laboratory test of a specimen of blood for alcohol analysis

Defined in terms of the alcohol-related driving convictions above, the courts notify DVLA of drivers convicted of an offence.

An independent medical examination will be arranged when an application for licence reinstatement is received by DVLA. The assessment may include:

- questionnaire
- serum CDT assay
- any further testing indicated

If a licence is awarded, the 'til 70 licence is restored for Group 1 car and motorcycle driving. Consideration may be given to a Group 2 licence.

If a high-risk offender has a previous history of alcohol dependence or persistent misuse but has satisfactory examination and blood tests, a short period licence is issued for ordinary and vocational entitlement but is dependent on their ability to meet the standards as specified.

A high-risk offender found to have a current history of alcohol misuse or dependence and/or unexplained abnormal blood test results will have the application refused.
06 Visual disorders

Minimum eyesight standards ................................................................. 108
Higher standard of visual acuity for bus and lorry drivers ............... 108
Minimum standards for field of vision ............................................... 109
Higher standards of field of vision for bus and lorry drivers .......... 110

Monocular vision ........................................................................... 111
Visual field defects ......................................................................... 112
Diplopia ......................................................................................... 113
Nyctalopia ..................................................................................... 113
Colour blindness ........................................................................... 113
Blepharospasm ............................................................................. 114
Nystagmus .................................................................................... 114
Minimum eyesight standards
– all drivers

The law requires that all licensed drivers meet the following eyesight requirements (including drivers aided by prescribed glasses or contact lenses):

■ in good daylight, able to read the registration mark fixed to a vehicle registered under current standards
  ■ at a distance of 20 metres with letters and numbers 79mm high by 50mm wide on a car registered since 1 September 2001
  or
  ■ at a distance of 20.5 metres with letters and numbers 79mm high by 57mm wide on a car registered before 1 September 2001
  and
  ■ the visual acuity must be at least Snellen 6/12 with both eyes open or in the only eye if monocular

Any driver unable to meet these standards must not drive and must notify DVLA, which will refuse or revoke a licence.

The law also requires all drivers to have a minimum field of vision, as set out below. Bioptic telescope devices are not accepted by DVLA for driving.

Higher standard of visual acuity
– bus and lorry drivers

Group 2 bus and lorry drivers require a higher standard of visual acuity in addition:

■ a visual acuity (using corrective contact lenses where needed) of at least:
  ■ Snellen 6/7.5 (Snellen decimal 0.8) in the better eye
  and
  ■ Snellen 6/60 (Snellen decimal 0.1) in the poorer eye
  ■ if glasses are worn to meet the minimum standards, they should have a corrective power not exceeding +8 dioptres in any meridian of either lens
Minimum standards for field of vision
– all drivers

The minimum field of vision for Group 1 driving is defined in the legislation:
“A field of at least 120° on the horizontal measured using a target equivalent to the white Goldmann III4e settings.
The extension should be at least 50° left and right. In addition, there should be no significant defect in the binocular field that encroaches within 20° of the fixation above or below the horizontal meridian.”
This means that homonymous or bitemporal defects that come close to fixation, whether hemianopic or quadrantanopic, are not usually acceptable for driving.

If DVLA needs a visual field assessment for determining fitness to drive, it:
■ requires the method to be a binocular Esterman field test
■ may request monocular full field charts in specific conditions
■ exceptionally, may consider a Goldmann perimetry assessment carried out to strict criteria

The Secretary of State’s Honorary Medical Advisory Panel for Visual Disorders and Driving advises that, for an Esterman binocular chart to be considered reliable for licensing, the false-positive score must be no more than 20%. When assessing monocular charts and Goldmann perimetry, fixation accuracy will also be considered.

Defect affecting central area only (Esterman within 20 degree radius of fixation)
Only for the purposes of licensing Group 1 car and motorcycle driving:
■ the following are generally regarded as acceptable central loss
  ■ scattered single missed points
  ■ a single cluster of up to 3 adjoining points
■ the following are generally regarded as unacceptable (‘significant’) central loss:
  ■ a cluster of 4 or more adjoining points that is either wholly or partly within the central 20° area
  ■ loss consisting of both a single cluster of 3 adjoining missed points up to and including 20° from fixation, and any additional separate missed points within the central 20° area
  ■ any central loss that is an extension of hemianopia or quadrantanopia of size greater than 3 missed points

Defect affecting the peripheral areas – width assessment
Only for the purposes of licensing Group 1 car and motorcycle driving:
■ the following will be disregarded when assessing the width of field
  ■ a cluster of up to 3 adjoining missed points, unattached to any other area of defect, lying on or across the horizontal meridian
  ■ a vertical defect of only single-point width but of any length, unattached to any other area of defect, which touches or cuts through the horizontal meridian

continued
Exceptional cases

Group 1 drivers whose previous full driving entitlement was removed because of a field defect failing to satisfy the standard may be eligible for individual relicensing consideration as exceptional cases under the following strict criteria:

- defect must have been
  - present for at least 12 months
  - caused by an isolated event or a non-progressive condition
- there must be no other condition or pathology regarded as progressive and likely to be affecting the visual fields (panel’s advice is that certain medical conditions, for example glaucoma and retinitis pigmentosa, would always be considered as progressive and so could not be considered as exceptional cases)
- sight in both eyes
- no uncontrolled diplopia
- no other impairment of visual function, including
  - no glare sensitivity, contrast sensitivity or impairment of twilight vision
- clinical confirmation of full functional adaptation

For exceptional cases considered to be potentially licensable under these criteria, DVLA will then require a satisfactory practical driving assessment at an approved centre (see Appendix G).

Static visual field defect

For prospective learner drivers with a static visual field defect, a process is now in place to apply for a provisional licence. For further information, see ‘Applying for a provisional licence if you’ve got a static visual field defect’.

Monocular individuals cannot be considered as exceptional cases under the above criteria.

Higher standards of field of vision
– bus and lorry drivers

The minimum standard for the field of vision is defined by the legislation for Group 2 bus and lorry licensing as:

- an uninterrupted measurement of at least 160° on the horizontal plane
- extensions of at least 70° left and at least 70° right
- extensions of at least 30° above and at least 30° below the horizontal plane
- no significant defect within 70° left and 70° right between 30° up and 30° down (it would be acceptable to have a total of up to 3 missed points, which may or may not be contiguous*)
- no defect is present within a radius of the central 30°
- no other impairment of visual function, including no glare sensitivity, contrast sensitivity or impairment of twilight vision

(*Points tested in the ‘letterbox’ outside the central radius of 30° from fixation.)
For Group 2 bus and lorry driving, it would be acceptable for a defect on visual field charts to have an upper limit of a total of 3 missed points – which may be contiguous – within the letterbox but outside the central 30° radius.

A total of more than 3 missed points, however – even if not contiguous – would not be acceptable for Group 2 driving because of the higher standards required.

Note that no defects of any size within the letterbox are licensable if a contiguous defect outside it means the combination represents more than 3 missed points.

Note Exception 1 in ‘Exceptions allowed by older licences’ below.

Clinically apparent visual inattention will be debarring for Group 1 and Group 2.

**Cataract**

<table>
<thead>
<tr>
<th>Group 1</th>

</tr>
</tbody>
</table>

**Monocular vision**

<table>
<thead>
<tr>
<th>Group 1</th>
<th>Group 2</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>car and motorcycle</strong></td>
<td><strong>bus and lorry</strong></td>
</tr>
<tr>
<td>◯ Must not drive and may need to notify DVLA. For complete loss of vision in one eye (cases where there is any light perception in the affected eye are not considered monocular), the driver: ■ must meet the same visual acuity and visual field standards as binocular drivers ■ may drive only after clinical advice of successful adaptation to the condition Only those monocular people who fail to meet these requirements are required to notify DVLA.</td>
<td>◯ Must not drive and must notify DVLA. The law bars licensing if in one eye there is: ■ complete loss of vision or ■ corrected acuity falls below Snellen 3/60 (Snellen decimal 0.05) See also ‘grandfather rights’ below.</td>
</tr>
</tbody>
</table>
Exceptions for visual acuity allowed by older licences (‘grandfather rights’)

The standards for Group 1 car and motorcycle licensing must be met before any of the following exceptions can be afforded to Group 2 bus and lorry drivers holding older licences.

Visual acuity

Exception 1

A driver must have been awarded a Group 2 bus and lorry licence before 1 March 1992, and be able to complete a satisfactory certificate of experience, to be eligible. If the licence was awarded between 2 March 1992 and 31 December 1996, visual acuity with corrective lenses if needed must be at least 6/9 in the better eye and at least 6/12 in the other eye; uncorrected visual acuity may be worse than 3/60 in one eye only.

Monocularly

Exception 2

Must have been awarded a Group 2 bus and lorry licence before 1 January 1991, with the monocularly declared before this date.

Exception 3

Drivers with a pre-1997 Group 1 licence who are monocular may apply to renew their category C1 (vehicles 3.5t to 7.5t). They must be able to meet the minimum eyesight standards which apply to all drivers and also the higher standard of field of vision for Group 2 (bus and lorry) drivers.

Visual field defects

<table>
<thead>
<tr>
<th>Disorders such as:</th>

Excessive sleepiness
– including obstructive sleep apnoea syndrome

‘Excessive sleepiness’ having, or likely to have, an adverse effect on driving includes:
- obstructive sleep apnoea syndrome of any severity
- any other condition or medication that may cause excessive sleepiness
- see also guidance on Primary/central hypersomnias, including narcolepsy

Legislation states that objective sleep study measurements for driving assessment purposes should use the apnoea-hypopnoea index (AHI). Recognising that not all sleep services use AHI, DVLA will accept results of equivalent objective tests.

The ‘Tiredness can kill’ leaflet (INF159) is for drivers concerned about excessive sleepiness.

- May drive and need not notify DVLA.

- Must be assessed but may not need to notify DVLA. For licensing, the paramount importance is placed on a proven ability to communicate in an emergency by:
  - speech
  - suitable alternative, for example SMS text

Inability is likely to result in a licence being refused or revoked.

## Cancers

In both driving groups, fitness to drive is affected by the risk of seizure.

All cases of eye cancer must meet the minimum requirements for vision (Chapter 6).

- Must be assessed but may not need to notify DVLA.

- Must be assessed but may not need to notify DVLA. Licensing requires specific consideration of the likelihood of cerebral metastasis and seizure, and there must be no complications, such as:
  - specific limb impairment, for example due to bone tumour, primary or secondary
  - general impairment, for example due to advanced malignancy producing symptoms such as general weakness or cachexia that affects driving

The effects of any cancer treatment must also be considered – the generally debilitating effects of chemotherapy and radiotherapy in particular.
HIV and Advanced HIV

Living with HIV and receiving treatment
If there has been no development of an illness affecting the brain, vision, or a physical disability which may impair the ability to drive, people with HIV may drive and do not need to inform DVLA of their condition.

People living with HIV with complications such as illness or requiring a hospital admission may be considered to have more advanced HIV.

People with advanced HIV do not need to inform DVLA unless they:

- have been advised by a medical professional that they must inform DVLA about a specific medical condition
- develop any medical condition that may impact their ability to drive (check relevant chapters in AFTD guidance)

In these situations, DVLA must be notified.

Age-related fitness to drive

Older age is not necessarily a barrier to driving.

- Functional ability, not chronological age is important in assessments.
- Multiple comorbidity should be recognised as becoming more likely with advancing age and considered when advising older drivers.
- Discontinuation of driving should be given consideration when an older person – or people around them – become aware of any combination of these potential age-related examples:
  - progressive loss of memory, impaired concentration and reaction time, or loss of confidence that may not be possible to regain.
- Physical frailty in itself would not necessarily restrict licensing, but assessment needs careful consideration of any potential impact on road safety.
- Age-related physical and mental changes vary greatly between individuals, though most will eventually affect driving.
- Professional judgement must determine what is acceptable decline and what is irreversible and/or a hazardous deterioration in health that may affect driving. Such decisions may require specialist opinion.

DVLA has doctors ready to provide guidance to healthcare professionals.

Cognitive decline or impairment after stroke or head injury

There is no single simple marker for the assessment of impaired cognitive function relevant to driving, although the satisfactory ability to manage day-to-day living could provide a yardstick of cognitive competence.

In-car, on-the-road assessments are an invaluable way of ensuring, in valid licence holders, there are no features liable to present a high risk to road safety, including these examples:

- visuospatial deficits, notable distractibility, impaired multi-task performance

The following are also important in showing there is no impairment likely to affect driving:

- adequate performance in reaction times, memory, concentration and confidence

Cognitive disability

Driving after surgery

Evaluating the likely effects of postoperative recovery

Notwithstanding any restrictions or requirements outlined in other chapters of this document, drivers do not need to notify DVLA of surgical recovery unless it is likely to affect driving and persist for more than 3 months.

Licence holders wishing to drive after surgery should establish with their own doctors when it would be safe to do so.

Any decision regarding returning to driving must take into account several issues, including:

- recovery from the effects of the procedure
- anaesthetic recovery from the effects of the procedure
- any distracting effect of pain
- analgesia-related impairments (sedation or cognitive impairment)
- other restrictions caused by the surgery, the underlying condition or any comorbidities

Drivers have the legal responsibility to remain in control of a vehicle at all times.

Drivers must ensure they remain covered by insurance to drive after surgery.
Chapter 08: Miscellaneous conditions

Temporary medical conditions

Drivers generally do not need to notify DVLA of conditions for which clinical advice has indicated less than 3 months of no driving.

If the judgement of the treating clinician is that DVLA needs to be notified, the healthcare professional should advise the patient to contact DVLA.

Such a judgement may be necessary for any of a range of conditions that may temporarily affect driving, including, but not limited to:

- postoperative recovery (see ‘Driving after surgery’)
- severe migraine
- limb injuries expected to show normal recovery
- pregnancy associated with fainting or light-headedness
- hyperemesis gravidarum
- hypertension of pregnancy
- recovery following Caesarean section
- deep vein thrombosis or pulmonary embolism

Fractures

A driver does not need to notify DVLA of a fracture, but if recovery post-fracture is prolonged for more than 3 months, the treating clinician should offer advice on a safe time to resume driving.
Medication effects

It is an offence to drive or attempt to drive while unfit because of alcohol and/or drug use – and driving laws do not distinguish between illegal and prescribed drugs.

Drivers taking prescribed drugs subject to the drug-driving legislation will need to be advised to carry confirmation that these were prescribed by a registered medical practitioner.

Some prescription and over-the-counter medicines can affect driving skills through drowsiness, impaired judgement and other effects.

Prescribers and dispensers should consider any risk of medications, single or combined, in terms of driving – and advise patients accordingly.

Without providing an exhaustive list, the following drug groups require consideration:

- **benzodiazepines** – these may cause sufficient sedation to make driving unsafe
- **antidepressants** – sedating tricyclics have a greater propensity to impair driving than SSRIs, which are less sedating. Advice for individual driving safety should be considered carefully for all antidepressants
- **antipsychotics** – many of these drugs will have some degree of sedating side effect via action on central dopaminergic receptors. Older drugs (chlorpromazine, for example) are highly sedating due to effects on cholinergic and histamine receptors. Newer drugs (olanzapine or quetiapine, for example) may also be sedating; others less so (risperidone, ziprasidone or aripiprazole, for example)
- **opioids** – cognitive performance may be reduced with these, especially at the start of use, but neuro-adaptation is established in most cases. Driving impairment is possible because of the persistent miotic effects of these drugs on vision.

Also refer to Chapter 4, psychiatric disorders, and Chapter 5, drug or alcohol misuse and dependence.
Appendix A

The legal basis for the medical standards

The Secretary of State for Transport, acting through DVLA, has the responsibility of ensuring all licence holders are fit to drive.

The legal basis of fitness to drive in the UK lies in the following legislation:

- The Road Traffic Act 1988
- The Motor Vehicles (Driving Licences) Regulations 1999 (as amended)

According to Section 92 of the Road Traffic Act 1988:

- A relevant disability is any condition which is either prescribed in regulations or any other disability where driving is likely to be a source of danger to the public. A driver who is suffering from a relevant disability must not be licensed, but there are some prescribed disabilities where licensing is permitted provided certain conditions are met.
- Prospective disabilities are any medical conditions that, because of their progressive or intermittent nature, may develop into relevant disabilities in time. Examples are Parkinson’s disease and early dementia. A driver with a prospective disability may be granted a driving licence for up to 5 years, after which renewal requires further medical review.

Sections 92 and 94 of the Road Traffic Act 1988 also cover drivers with physical disabilities who require adaptations to their vehicles to ensure safe control. These adaptations must be coded and shown on the licence. See Appendix F, disabilities and vehicle adaptations and Appendix G, Mobility Centres and Driving Assessment Centres.

‘Serious neurological disorders’

The law requires that driving licences shall not be issued to, nor renewed for, applicants with serious neurological disorders, unless supported by the applicant’s doctor.

A serious neurological disorder is defined for the purposes of driver licensing as any condition of the central or peripheral nervous system that has led, or may lead, to functional deficiency (sensory, including special senses, motor, and/or cognitive deficiency), and that could affect ability to drive.

When DVLA evaluates the licensing of these applicants, it will consider the functional status and risk of progression. A short-term licence for renewal after medical review is generally issued whenever there is a risk of progression.

Further information relating to specific functional criteria is found in the following chapters:

- Chapter 1, neurological disorders
- Chapter 4, psychiatric disorders
- Chapter 6, visual disorders
- Chapter 8, miscellaneous conditions – excessive sleepiness
Appendix B
Epilepsy and seizure rules and further guidance

The legislation governing drivers who experience a seizure.

The following 2 boxes extract the paragraphs from regulations 72 and 73 of the Motor Vehicle (Driving Licences) Regulations 1999 (as amended) that govern the way in which epilepsy is ‘prescribed’ as a ‘relevant’ disability for Group 1 or Group 2 drivers (also see Appendix A, the legal basis for the medical standards).

Group 1 car and motorcycle

Regulations 72

(2) Epilepsy is prescribed for the purposes of section 92(2) of the Traffic Act 1988 as a relevant disability in relation to an applicant for, or a holder of, a Group 1 licence who has had two or more epileptic seizures during the previous five year period.

(2A) Epilepsy is prescribed for the purposes of section 92(4)(b) of the Traffic Act 1988 in relation to an applicant for a Group 1 licence who satisfies the conditions set out in paragraph (2F) below and who has either:

(a) been free from any unprovoked seizure during the period of one year immediately preceding the date when the licence is granted

or

(b) during that one year period has suffered no unprovoked seizure other than a permitted seizure.

(2B) A permitted seizure for the purposes of paragraph (2A)(b) is:

(a) a seizure – which can include a medication-adjustment seizure – falling within only one of the permitted patterns of seizure

or

(b) a medication-adjustment seizure, where:

(i) that medication-adjustment seizure does not fall within a permitted pattern of seizure

(ii) previously effective medication has been reinstated for at least 6 months immediately preceding the date when the licence is granted

(iii) that seizure occurred more than 6 months before the date when the licence is granted; and

(iv) there have been no other unprovoked seizures since that seizure

or

(c) a seizure occurring before a medication-adjustment seizure permitted under sub-paragraph (b) where:

(i) that earlier seizure has, to that point, formed part of only one permitted pattern of seizure and had occurred prior to any medication-adjustment seizure not falling within the same permitted pattern

or

(ii) it is a medication-adjustment seizure, which was not followed by any other type of unprovoked seizure, except for another medication-adjustment seizure.
(2C) A permitted pattern of seizure for the purposes of paragraph (2B) is a pattern of seizures:

(a) occurring during sleep, where:
   (i) there has been a seizure while asleep more than one year before the date when the licence is granted
   (ii) there have been seizures only while asleep between the date of that seizure while asleep and the date the licence is granted
   (iii) there has never been an unprovoked seizure while awake
   or
(b) occurring during sleep, where:
   (i) there has been a seizure while asleep more than three years before the date when the licence is granted
   (ii) there have been seizures only while asleep between the date of that seizure while asleep and the date the licence is granted
   (iii) there is also a history of unprovoked seizure while awake, the last of which occurred more than 3 years before the date when the licence is granted
   or
(c) without influence on consciousness or the ability to act, where:
   (i) such a seizure has occurred more than 1 year before the date when the licence is granted
   (ii) here have only been such seizures between the date of that seizure and the date when the licence is granted
   (iii) there has never been any other type of unprovoked seizure.

(2D) An isolated seizure is prescribed for the purposes of section 92(2) of the Traffic Act 1988 as a relevant disability in relation to an applicant for, or a holder of, a Group 1 licence:

(a) in a case where there is an underlying causative factor that may increase future risk, where such a seizure has occurred during the previous 1 year period
   and
(b) in any other case, where such a seizure has occurred during the previous 6 month period.
Appendix B: Epilepsy regulations and further guidance

(2E) An isolated seizure is prescribed for the purposes of section 92(4)(b) of the Traffic Act 1988 in relation to an applicant for a Group 1 licence, who:

(a) (i) in a case where there is an underlying causative factor that may increase future risk, has had such a seizure more than one year immediately before the date when the licence is granted

and

(ii) in any other case, has had such a seizure more than 6 months immediately before the date when the licence is granted

(b) has had no other unprovoked seizure since that seizure

and

(c) satisfies the condition set out in paragraph (2F).

(2F) The conditions are that:

(a) so far as is predictable, the applicant complies with the directions regarding treatment for epilepsy or isolated seizure, including directions as to regular medical check-ups made as part of that treatment, which may from time to time be given by a registered medical practitioner or one of the clinical team working under the supervision of that registered medical practitioner

(b) if required to do so by the Secretary of State, the applicant has provided a signed declaration agreeing to observe the condition in sub-paragraph (a)

(c) if required by the Secretary of State, there has been an appropriate medical assessment by a registered medical practitioner

and

(d) the Secretary of State is satisfied that the driving of a vehicle by the applicant in accordance with the licence is not likely to be a source of danger to the public.

Group 2 bus and lorry

Regulations 73

(8) Epilepsy is prescribed for the purposes of section 92(2) of the Traffic Act as a relevant disability in relation to an applicant for, or a holder of, a Group 2 licence, where two or more epileptic seizures have occurred, or that person has been prescribed medication to treat epilepsy, during the previous ten year period.

(8A) Epilepsy is prescribed for the purposes of section 92(4)(b) of the Traffic Act 1988 in relation to an applicant for a group 2 licence who:

(a) in the case of a person whose last epileptic seizure was an isolated seizure satisfies the conditions in paragraph (8C) and (8D)

or
Appendix B: Epilepsy regulations and further guidance

(b) in any other case, satisfies the conditions set out in paragraph (8D) and who, for a period of at least 10 years immediately preceding the date when the licence is granted has:
(i) been free from any epileptic seizure
and
(ii) has not been prescribed any medication to treat epilepsy.

(8B) An isolated seizure is prescribed for the purposes of section 92(2) of the Traffic Act 1988 as a relevant disability, in relation to an applicant for, or a holder of, a Group 2 licence, where during the previous 5 year period, such a seizure has occurred, or that person has been prescribed medication to treat epilepsy or a seizure.

(8C) An isolated seizure is prescribed for the purposes of section 92(4)(b) of the Traffic Act 1988 in relation to an applicant for a Group 2 licence who satisfies the conditions set out in paragraph (8D) and who, for a period of at least five years immediately preceding the date when the licence is granted:
(a) has been free from any unprovoked seizure
and
(b) has not been prescribed medication to treat epilepsy or a seizure.

(8D) The conditions are that:
(a) if required by the Secretary of State, there has been an appropriate medical assessment by a neurologist
and
(b) the Secretary of State is satisfied that the driving of a vehicle by the applicant, in accordance with the licence, is not likely to be a source of danger to the public.

Withdrawal of epilepsy medication

This guidance relates only to epilepsy treatment.

During the therapeutic procedure of epilepsy medication being withdrawn by a medical practitioner, the risk of further epileptic seizures should be noted from a medicolegal point of view.

If an epileptic seizure does occur, the patient will need to meet the medical standards before resuming driving and will need to be counselled accordingly.

It is clearly recognised that withdrawal of epilepsy medication is associated with a risk of seizure recurrence. A number of studies have shown this, including a randomised study of withdrawal in patients in remission conducted by the Medical Research Council’s study group on epilepsy drug withdrawal. This study showed a 40% increased risk of seizure associated with the first year of withdrawal compared with continued treatment.

The Secretary of State for Transport’s Honorary Medical Advisory Panel on Driving and Disorders of the Nervous System states that patients should be warned of the risk they run, both of losing their driving licence and of having a seizure that could result in a road traffic accident.

The Advisory Panel states that drivers should usually be advised not to drive from the start of the withdrawal period and for 6 months after treatment cessation – it considers that a person remains as much at risk of seizure during the withdrawal as during the following 6 months.
Appendix B: Epilepsy regulations and further guidance

This advice may not be appropriate in every case, however. One specific example is withdrawal of anticonvulsant medication when there is a well-established history of seizures only while asleep.

In such cases, any restriction on driving is best determined by the physicians concerned, after considering the history. It is the patient’s legal duty to comply with medical advice on driving.

It is important to remember that the driver licensing rules remain relevant in cases of medication being omitted as opposed to withdrawn, such as on admission to hospital.

For changes of medication, for example due to side effect profiles, the following general advice is applicable:

- When changing from one medication to another and both would be reasonably expected to be equally efficacious, then no period of time off driving is recommended.
- When the new medication is felt to be less efficacious than the previous medication, the 6 months off driving period is recommended. This time period would start from the end of the change over period.

Provoked seizures

To be considered a provoked seizure, the seizure must be attributable solely to a recognisable provoking cause and that causative factor must be reliably avoidable. It should be clear that the seizure has been provoked by a stimulus which is unlikely to be repeated.

Driving will usually need to cease for 6 months (group 1) (in the absence of previous unprovoked seizures or existing cerebral pathology) or up to 5 years (group 2) following a provoked seizure.

Doctors may wish to advise patients that the likely total period of time they will be required by DVLA not to drive will be extended if there is a previous history of unprovoked seizure or evidence of pre-existing cerebral pathology (e.g. longstanding cerebral lesion, epileptic activity on EEG or evidence of fixed neurological deficit), that increases the risk of further seizures.

The following seizures may be treated as provoked:

- true seizures associated with cardiovascular syncope (convulsive syncope is not considered to be a seizure and the relevant syncope standard must be met)
- seizure in the first week following a head injury
- seizure in the first week following a stroke, TIA or spontaneous acute subdural haematoma
- seizure during, or in the first week following, intracranial surgery
- seizure associated with severe electrolyte or biochemical disturbance (including hypoglycaemia) documented within 24 hours of specific biochemical or haematologic abnormalities
- seizure associated with drug or alcohol intoxication or withdrawal, or exposure to well-defined epileptogenic drugs

The following provoked seizures are excepted and do not require driving to cease, although the relevant medical standards for the underlying condition will have to be met:

- seizures occurring at the very moment of impact of a head injury
- eclamptic seizures
- seizures provoked by electroconvulsive therapy
Appendix C: Cardiovascular considerations

Appendix C
Cardiovascular considerations

Group 2 bus and lorry entitlement only

Licence duration
A bus or lorry (Group 2) licence issued after cardiac assessment for established cardiovascular disease will usually be short-term, for a maximum licence duration of 3 years, and licence renewal will require satisfactory medical reports.

Exercise tolerance testing
The preferred functional test to assess fitness to drive is an exercise tolerance test.

The requirements for exercise evaluation to assess fitness for Group 2 licensing are:

1. Discontinuation of anti-anginal medication (i.e., nitrates, beta blockers, calcium channel blockers, nicorandil, ivabradine, and ranolazine) prior to exercise tolerance testing is not required.

2. The default test should be a treadmill exercise test with the Bruce protocol.

3. Bicycle ergometry is a suitable alternative when the individual cannot use the treadmill.

4. The customer should be able to safely complete 3 stages (9 minutes) of the standard Bruce protocol (or cycle for 10 minutes with 20 W per minute increments, to a total of 200 W) without signs of cardiovascular dysfunction, such as:
   - angina pectoris
   - syncope
   - fall in systolic blood pressure of 20mmHg or more
   - arrhythmia that requires intervention or premature termination of the exercise test

5. There must be no electrocardiographic ST segment deviation that is interpreted by a cardiologist to be indicative of inducible myocardial ischaemia (usually defined as at least 2 mm horizontal or down-sloping ST-segment depression or 2mm ST-segment elevation), either during exercise or the recovery period.

6. When exercise testing is undertaken as part of medical enquiries regarding aortic stenosis, hypertrophic cardiomyopathy or cardiac transplantation, pre-existing ST segment abnormality may confound interpretation of any exercise-induced ST-segment deviation. In such cases, the test is undertaken to assess the haemodynamic response to exercise and as a marker of exercise capacity.

7. Should atrial fibrillation develop de novo during exercise testing, the supervising clinician should determine whether it is appropriate to complete the test. If the test is completed and the DVLA exercise tolerance test criteria above are met, licensing will be subject to echocardiographic confirmation that left ventricular ejection fraction is at least 40% and the licensing requirements for individuals with pre-existing atrial fibrillation (see ‘Arrhythmias’ section in ‘Assessing fitness to drive: guide for medical professionals’).

8. If there is established coronary heart disease, DVLA will require exercise or other functional evaluation at regular intervals not to exceed 3 years.
Appendix C: Cardiovascular considerations

**Stress myocardial perfusion scan or stress echocardiography**

A functional imaging test (radionuclide stress myocardial perfusion imaging, stress echocardiography, or stress cardiac MRI) can be considered as an alternative to exercise testing for customers with:

- left bundle branch block (LBBB)
- right bundle branch block with QRS exceeding 120 ms
- paced rhythm
- musculoskeletal or other disability that prevents exercise on a treadmill or cycle ergometer

If the exercise standard cannot be met because of lack of fitness or other non-cardiac reasons, a report may be requested from the supervising clinician before a functional imaging test is commissioned.

The licensing standards for functional imaging tests are:

- no more than 10% of the left ventricular myocardium is affected by reversible ischaemic change on myocardial perfusion imaging
- or
- no more than one segment is affected by reversible ischaemic change on stress echocardiography.

**Left ventricular ejection fraction**

Group 2 licencing requires a resting left ventricular ejection fraction of at least 40%. The preferred methods for assessment of left ventricular function are echocardiography or cardiac magnetic resonance imaging.

Full DVLA protocol requirements for these tests are available on request (see contact details).

**Coronary angiography**

For licensing purposes in individuals with coronary artery disease, DVLA considers non-invasive functional assessment to be more important than angiographic assessment of coronary artery disease severity.

For this reason, coronary angiography is not commissioned by DVLA. Exercise tolerance testing and, where necessary, myocardial perfusion imaging or stress echocardiography are the investigations of relevance (outlined above) with the standards as indicated to be applied.

If there is a conflict between the results of a non-invasive functional test and recent (within 6 months) coronary angiography, the case will be considered individually. This assessment will take account of angiographic evidence of obstructive and non-obstructive coronary artery disease, and any evidence of functional coronary artery abnormality.
Appendix C: Cardiovascular considerations

**Marfan syndrome: aortic root surgery**

Group 2 licensing after aortic surgery for Marfan syndrome will require individual assessment.

A bus or lorry licence for annual review may be issued after elective aortic root replacement surgery provided:

- surgery is successful without complications
- there is satisfactory regular specialist follow-up
- there is no evidence of suture-line aneurysm postoperatively and on 2-yearly MRI or CT surveillance

**Group 2 licensing following elective external aortic support procedures will require individual consideration. Continued licensing thereafter will require regular clinical review, including MRI imaging one year after surgery and every 3 years thereafter.**

**Aortic stenosis (to include sub-aortic and supravalvular stenosis)**

Aortic stenosis severity should be assessed from clinical, echocardiographic and biomarker parameters, in line with recommendations in 2021 ESC/EACTS guidelines for the management of valvular heart disease.
Appendix C: Cardiovascular considerations

ESC Hypertrophic Cardiomyopathy Risk-SCD Calculator

This calculator is recommended by the European Society of Cardiology to assess sudden cardiac death (SCD) risk in individuals with hypertrophic cardiomyopathy. The calculator assigns individuals with hypertrophic cardiomyopathy to low risk (5-year risk of SCD less than 4%), intermediate risk (5-year risk of SCD 4 to 6%), or high risk (5-year risk of SCD equal to or greater than 6%) categories.

An online version of the calculator is available at: https://qxmd.com/calculate/calculator_303/hcm-risk-scd

Congenital heart disease

Complexity of congenital heart disease can be classified as mild, moderate or severe. Refer to table 4 in the 2020 European Society of Cardiology guidelines for the management of adult congenital heart disease.
Appendix D
INF188/2 leaflet

Information for drivers with diabetes, including the INF294 leaflet.
Appendix E: Important notes concerning psychiatric disorders

All mental health symptoms must be considered

Any psychiatric condition that does not fit neatly into the classifications in Chapter 4 will need to be reported to DVLA if it is causing or is considered likely to cause symptoms that would affect driving.

Such symptoms include, for example:
- any impairment of consciousness or awareness
- any increased liability to distraction
- or any other symptoms affecting the safe operation of the vehicle

The patient should be advised to declare both the condition and the symptoms of concern.

It is the relationship of symptoms to driving that is of importance.

The law sets out the minimum medical standards of fitness to drive and the requirements for mental health in broad terms that:
- there is a clear distinction between the standards for Group 1 car and motorcycle, and Group 2 bus and lorry licensing. The standards for the latter are more stringent because of the size of the vehicles and the greater amounts of time spent at the wheel by occupational drivers
- severe mental disorder is a prescribed disability for the purposes of section 92 of the Road Traffic Act 1988. Regulations define “severe mental disorder” as including mental illness, arrested or incomplete development of the mind, psychopathic disorder, and severe impairment of intelligence or social functioning
- the standards of fitness to drive must reflect, not only the need for an improvement in the mental state, but also a period of stability, such that the risk of relapse can be assessed should the patient fail to recognise any deterioration
- misuse of or dependence on alcohol or drugs are cases that require consideration of the standards in Chapter 5 in addition to those for psychiatric disorders in Chapter 4

Medications

Section 4 of the Road Traffic Act 1988 does not differentiate between illicit and prescribed drugs.

Any person driving or attempting to drive on a public highway or other public place while unfit due to any drug is liable for prosecution.
- All drugs with an action on the central nervous system can impair alertness, concentration and driving performance.
- This is of particular relevance at the initiation of treatment, or soon after, and also when dosage is being increased. Anyone who is adversely affected must not drive.
- It should be taken into account when planning the treatment of a patient who is a professional driver that the older tricyclic antidepressants can have pronounced anticholinergic and antihistaminic effects, which may impair driving, whereas the more recently developed antidepressants may have fewer such effects.
Appendix E: Important notes concerning psychiatric disorders

- Antipsychotic drugs, including depot preparations, can cause motor or extrapyramidal effects as well as sedation or poor concentration. These effects, either alone or in combination, may be sufficient to impair driving, and careful clinical assessment is required.
- The epileptogenic potential of psychotropic medication should be given particular consideration in patients who are professional drivers.
- Benzodiazepines are the psychotropic medications most likely to impair driving performance – the long-acting compounds in particular – and alcohol will potentiate effects.
- Doctors have a duty of care to advise their patients of the potential dangers of adverse effects from medications and their interactions with other substances, especially alcohol.

Electroconvulsive therapy

The likely severity of the underlying condition requiring electroconvulsive therapy (ECT) means the driver should be advised that they must notify DVLA.

Electroconvulsive therapy is usually employed in the context of an acute intervention for a severe depressive illness or, less commonly, as longer-term maintenance therapy.

In both courses, it is the severity of the underlying mental health condition that is of prime importance to the determination of whether driving may be permitted.

A seizure induced by ECT is regarded as provoked for the purposes of fitness to drive and is not a bar to licensing and driving – under both Group 1 car and motorcycle, and Group 2 bus and lorry.

The concerns for driving are:

- severity of the underlying illness requiring ECT treatment
- potential cognitive or memory disturbances associated with both the underlying depression and the ECT therapy.

Driving must stop during an acute course of treatment with ECT and is not permitted until the relevant medical standards and observation periods associated with underlying conditions have been met, as set out in Chapter 4 and with respect to any other mental health symptoms or psychiatric conditions that do not fit neatly into classifications.

Again, this guidance must stress that the underlying condition and response to treatment are what determine licensing and driving.

Where ECT is used as maintenance treatment with a single treatment sometimes given weeks apart there may be minimal or no symptoms. This would not affect driving or licensing providing there is no relapse of the underlying condition.

Driving must stop for 48 hours following the administration of an anaesthetic agent.
Appendix F: Disabilities and vehicle adaptations

Appendix F
Disabilities and vehicle adaptations

Group 1 car and motorcycle
Driving often remains possible with certain adjustments for a disability, whether for a static and progressive disorder or a relapsing one. These vehicle modifications may be needed for:

- permanent limb and spinal disabilities – for example, amputation, hemiplegia, cerebral palsy, ankylosing spondylitis, or severe arthritis (especially with pain)
- chronic neurological disorders – for example, multiple sclerosis, Parkinson’s disease, motor neurone disease, or peripheral neuropathy

Vehicle adaptations range from simple automatic transmission for many disorders, to sophisticated modifications such as joysticks and infrared controls for people with severe disabilities.

DVLA will need to know about a disability and whether any controls require modification, and will ask the patient to complete a simple questionnaire.

The driving licence is coded to reflect any vehicle modifications.

Assessment centres offer people advice about driving with a disability (these are listed in Appendix G).

Note that a person in receipt of the mobility component of Personal Independence Payment (PIP) can hold a driving licence from 16 years of age. (A person can’t apply for PIP until their 16th birthday.)

Group 2 bus and lorry
Some disabilities, if mild and non-progressive, may be compatible with driving large vehicles. DVLA needs to be notified and will require an individual assessment.

Mobility scooters and powered wheelchairs
Users of Class 2 or 3 mobility vehicles – which are limited to 4 mph or 8 mph respectively – are not required to hold a driving licence, and they do not need to meet the medical standards for driving motor vehicles. DVLA recommends the following, however:

- individuals with a medical condition that may affect their ability to drive these mobility vehicles should consult their GP first
- users should be able to read a car number plate from a distance of 12.3 metres.

For more information, see Mobility scooters and powered wheelchairs: the rules.

Assessing fitness to drive
– a guide for medical professionals

DVLA
Longview Road
Morriston
Swansea
SA6 7JL

www.gov.uk/dvla/fitnesstodrive

© Crown copyright – DVLA 1993-2021

This document may be cited in part or in whole for the specific guidance of doctors and patients. However, the document must not be reproduced in part or in whole for commercial purposes.

This guidance is published by the Department for Transport. It describes the law relating to medical aspects of driver licensing. In particular, it advises members of the medical profession on the medical standards that need to be met by individuals to hold licences to drive various categories of vehicle. The Department for Transport has prepared this document on the advice of the Secretary of State’s Honorary Advisory Panels of medical specialists.

This document provides the basis on which members of the medical profession advise individuals on whether any particular condition could affect their driving entitlement. It is the responsibility of the individual to report the condition to the DVLA in Swansea.
