Introductory note

This introductory note does not form a part of the notice

Under the Environmental Permitting (England & Wales) Regulations 2016 (schedule 5, part 1, paragraph 19) a variation may comprise a consolidated permit reflecting the variations and a notice specifying the variations included in that consolidated permit.

Schedule 1 of the notice specifies the conditions that have been varied and schedule 2 comprises a consolidated permit which reflects the variations being made. Only the variations specified in schedule 1 are subject to a right of appeal.

Changes introduced by this variation include:

- An amendment to the permit boundary to incorporate additional land and building
- Add a new waste operation (A12 physical treatment of non-hazardous WEEE waste)
- Increase the tonnes per annum (tpa) of material accepted and treated from 24,999 to 29,999 tpa
- Add additional EWC codes across the permitted waste activities
- Add a second mechanical separation plant (attritor shredder) with a point source emission to air, for the treatment of non-hazardous wastes
- Relocate the Paint and Aerosol Plant and associated point source emission within the main building

Brief description of the process

The regulated facility comprises:

The operations on Site include the following Schedule 1 Activities:

- Section 5.3 Part A(1)(a)(ii) A fridge destruction plant (with a hazardous waste treatment capacity exceeding 10 tonnes per day);
- Section 5.3 Part A(1)(a)(ii) Mechanical treatment of hazardous WEEE (with a capacity exceeding 10 tonnes per day);
- Section 5.3 Part A(1)(a)(ii) Treatment of paint containers (with a capacity exceeding 10 tonnes per day);
- Section 5.3 Part A(1)(a)(ii) Treatment of aerosol wastes (with a capacity exceeding 10 tonnes per day);
- Section 5.3 Part A(1)(a)(ii) Treatment of airbags (with a capacity exceeding 10 tonnes per day);
- Section 5.3 Part A(1)(a)(iv) Bulking and repackaging of liquid wastes (with a capacity exceeding 10 tonnes per day); and
- Section 5.6 A(1)(a) Storage of more than 50 tonnes of hazardous waste.

In addition to the installation activity, Aqua Force are also permitted to undertake the following waste operations:

- Treatment and storage of non-hazardous waste for the purpose of disposal or recovery (no more than 75 tonnes per day).
- New waste operation; Physical treatment of non-hazardous WEEE, other than waste refrigeration equipment (no more than 75 tonnes per day).

The site is located in Four Ashes, Wolverhampton in an industrial estate, bounded by other industrial units and a railway line to the west of the site.

The facility operations are divided into two distinct activities: WEEE waste treatment and recovery, and hazardous waste recovery, transfer and treatment. The WEEE activities comprise commercial and domestic fridge treatment; transfer of hazardous and non-hazardous WEEE wastes such as Cathode Ray Tubes and Televisions; and transfer of commercial and domestic source batteries. The hazardous waste activities comprise asbestos waste transfer; paint waste recovery; oily wastes transfer e.g. oily rags and protective clothing; airbag treatment; and aerosol treatment.

There are residential properties within 250m of the site. With sensitive habitats including, Mottey Meadows SAC 8.6km from the site, and Four Ashes Pit SSSI 320m south-west of the site. Somerford Woods and Land at Four Ashes are Local Wildlife Sites within 570m and 260m of the facility, respectively.

All permitted operations including storage and treatment activities are undertaken within buildings, with sealed drainage, with no discharges to controlled water from the facility.

Emissions to air derive from the fridge processing plant via an exhaust stack, which is limited to discharge at a rate not exceeding 5g/hour CFC gases. Emissions abatement from the fridge processing plant operates by activated charcoal beds which retain exhaust CFC gases. The filters are regenerated from steam generated from the steam boiler. Further air emissions come from the paint processing plant and aerosol destruction plant which are linked into a single stack, and from the attritor shredder introduced to streamline the depackaging of non-hazardous waste recycling activities as part of this variation.

The facility operators an environmental management system (EMS) in accordance with the requirements of ISO14001, with relevant technical competence requirements.

Fridge Destruction Plant

The Fridge Destruction Plant involves the treatment of commercial and domestic fridges. These are segregated by type and undergoes a two-stage process:

- Stage 1 (degassing) for removal of refrigerant and oil.
- Stage 2 (shredding).

For the Stage 1 process, gases are collected and transferred to a collection cylinder, which is then transferred off-site for destruction by incineration.

Prior to the Stage 2 process, the compressor and cooling matrix from the fridge is removed for recovery, with any other hazardous components (mercury switches, condensers, etc.) are removed for disposal. The remaining fridge carcass (including insulation foam) is shredded via two shredders to recover the gases and then further segregated into its recyclable components – ferrous metals, non-ferrous metals, and plastics.

There are extractions vents on each shredder to collect any liberated gases which feeds to a carbon absorption bed. Foam attached to the plastic is fed to a hammer mill via a screw auger to further separate these fractions, with a high air flow vortex to draw up any liberated gases and the foam.

The fridge destruction plant operates at a capacity of 25 units per hour, operating for 12 hours of running time per day.

Treatment of Paint Containers

The site accepts mixed hazardous, as well as non-hazardous paint wastes. These are stored and treated in two separate areas to ensuring there is no accidental mixing.

All paints are de-packaged by shredding and crushing of the paint containers. Solvent-based paints are bulked for recovery, whilst water-based paints are bulked for further treatment off-site at an authorised facility.

The two streams of paint are batched processed via an Evolution 200, which feeds the paint through a conveyor, hopper and screw auger which crushes the paint tins towards an outlet. All liquid present in the tin is separated from the container and falls via gravity to a separation grid and into IBC collection vessels beneath.

Treatment of Aerosol Wastes

Aerosol wastes are accepted and delivered to site in 205 litre clip-top drums and stored in a specifically designed aerosol drum container.

Aerosol waste is fed into an aerosol shredding plant, with a linked extraction system to the paint processing plant. This comprises of a filtration system for particulates and vents any residual gases to air outside the building.

A drip tray collects any residual contents of the canisters and emptied into 205 litre drums for disposal offsite. The shredded material is transferred off-site for further recovery.

<u>Paint and Aerosol plant</u>- currently relocated within the main building and will only be permitted to return to its original location, subject to completion of the pre-operational condition included with this variation.

<u>Attritor shredder</u> –mechanical separation plant to separate non-hazardous waste solids from liquids and will ensure incompatible wastes are not shredded concurrently. Residual liquids are released into a container beneath and stored in IBCs pending transfer. Dry packaging is conveyed out, then bulked pending transfer. Appropriate bunding and emissions abatement with associated emission point (AR4).

Treatment of Airbags

Faulty airbags are delivered to site in 205 litre clip-top drums and stored in a specified area. The airbags are deployed via a 12v current and is a fully contained system. This causes the airbags to deflate in an upper chamber, which are then removed and placed in a skip for disposal as non-hazardous waste. Any inert devices left over and then shredded for further recovery.

There is an active extraction system to expel and vent any gases or dusts generated during deployment. However, no current emission point is linked to this. Existing improvement conditions (IC11 and IC12) are included to review the current measures in place and minimise where possible the emissions to air, as well as the submission of a programme for sampling and characterising the waste output materials. In the interim, the operator will deploy airbags within the sealed chamber and not open it until all particulates have sedimented in order to prevent excessive fugitive emissions of dust.

Bulking and Repackaging

Waste liquids are removed from their original packaging (for example, 5 litre drums) and decanted into a larger container of waste liquids of similar composition and hazardous properties for transport off-site.

An existing improvement condition (IC5) is included to meet the relevant appropriate measures or provide alternative measures that provide an equivalent level of mitigation for fugitive emissions.

Wastes such as oily rags or loose waste are collected in skips and bulked together in an IBC or another skip for removal off-site.

The site also accepts portable batteries which are segregated and stored according to type. No treatment of batteries occurs on site. Cathode Ray Tubes, Flat Panel Display, and Gas Discharge Lamps are also accepted for transfer only.

A steam boiler also operates on site with a net thermal input approximately 746 Kw/h. This is used as a fuel source for the fridge destruction plant. It also serves to generate steam which helps to recover trapped CFC gases within the charcoal beds.

The schedules specify the changes made to the permit.

The status log of a permit sets out the permitting history, including any changes to the permit reference number.

Table S1.4 Specified treatment methods and standards for the treatment of WEEE and components of WEEE

Stage 1) Pre-destruction treatment (degassing) of WTEE

Refrigerants and oils must be properly extracted and treated. Ozone depleting gases must be treated in accordance with Regulation (EC) No 1005/2009.

Degassing of the refrigeration cooling system must be undertaken in a manner that results in the removal of at least 99% of the refrigerant and the oil from the cooling circuit.

The degassing of WTEE must be undertaken in a way that prevents fugitive losses of refrigerant and achieves the following refrigerant recovery rate:

 90% or more, based upon a mass balance calculation, as set out in Waste temperature exchange equipment: appropriate measures for permitted facilities

The oil removed from the cooling circuit must be treated to ensure that the concentration of refrigerant in the oil is <0.9% w/w unless it is transferred immediately to a suitable sealed container to prevent fugitive emissions and sent for further refrigerant recovery or destruction.

Stage 2) WTEE and insulation panel destruction

VFC and VHC blowing agents must be properly extracted and treated. Ozone depleting gases must be treated in accordance with Regulation (EC) No 1005/2009.

WTEE must not be subject to the destruction process unless treated to the appropriate Stage 1 pre-destruction standards specified above.

The destruction of WTEE and insulation panels must be undertaken in a contained environment that prevents fugitive losses of blowing agent and achieves the following blowing agent removal and recovery rates:

- 90% or more, based upon an annual assessment of a representative sample of the WTEE treated Note 1
- 80% or more, based upon a monthly assessment of the WTEE treated that period Note 1

Residual materials resulting from the destruction of WTEE and insulation panels must meet the specified standards below:

- Metal The quantity of foam remaining in the granulated ferrous and non-ferrous metal fractions after treatment shall not exceed 0.5% w/w
- Plastic The quantity of foam remaining in the granulated plastic fraction after treatment shall not exceed 1% w/w
- Foam The quantity of residual blowing agent remaining in the polyurethane foam after treatment shall not exceed 0.2% w/w
