FIGURE 3.4

A
Area of poor quality G1D other lowland acid grassland to be enhanced through ecological management to improve condition and prevent succession of scrub. Grassland will be further managed to improve the quality of the fungi habitat.

B1
Area of transitional scrub encroaching on grassland habitat to be removed. Area to be used as a donor site for fungi turve translocation and to be managed as g1d fungi grassland.

B2
Additional areas of scrub to be cleared to create further g1d fungi grassland where required.

C
Ecological engancement of existing scrub

D
G1d grassland within the proposed construction areas in the centre and southeast of the application areas, adjacent to existing runways

E
Area previously mapped as g4 modified grassland. However, given the diversity and abudance of CHEGD fungi fruitbodies, the floristic composition of the grassland is negated by the presence of a diverse waxcap assemblage and is better place under g3c (other neutral grassland) with a secondary code (waxcap grassland)

Operation access road

10m wide boundary tree planting to filter/softed the proposed development in views from the east

15m wide tree planting to soften appearance of the proposed development from the west

Construction access road

Single row of boundary tree planting to filter/soften the proposed development in views from the east

Sports field and assault course to be retained

Enhance existing sports field boundary strip
