Rating Cost Guide 2026

Abattoirs

CG Code: STS001

Specific: Meat Processing Facility

Descriptive: Single storey meat processing factory with mezzanine offices.

Tech 1: Over 500m2

Tech 2: -

Unit size: -

Unit of measurement: m2

ERC: £1,981

Superseded codes: -

Location factor: Location Adjustment Applicable (See Guidance Notes) - ERC = UK mean of 1.00

Description: Concrete foundations and slab; metal/concrete upper floor. Timber stairs. Steel frame, roof and wall cladding. Facing brick/block walls. Double glazed aluminium windows. Block partitions. Flush doors. Plaster and tiles to walls; carpet, quarry tile and cementitious polymer flooring; plasterboard and suspended ceilings. Fittings. Abattoir and hygiene equipment. Floor drains and disposal. Includes prime cost sum for heating, electrics, sanitary ware and wash-down system; refrigeration and air conditioning. Loading dock.

CG Code: 60A04A

Specific: Hoarding

Descriptive: Freestanding

Tech 1: Timber

Tech 2: Crown 8

Unit size: One

Unit of measurement: Each

ERC: £1,073

Superseded codes: -

Location factor: Location Adjustment Applicable (See Guidance Notes) - ERC = UK mean of 1.00

Description: Hoardings - Freestanding - Timber. Typically the construction comprises a metal or plywood faced signboard with painted softwood frame surround, mechanically fixed to vertical metal stanchions set into concrete pad foundations. Freestanding hoardings (excluding lighting). An advertising hoarding is a large outdoor signboard found in places with high traffic such as cities, roads and motorways, aiming to show large advertisements to pedestrians and drivers. Some supports are wholly timber with stays, but the difference in cost compared to steel stanchions (which require no stays) is not significant. The size of hoardings directly relates to the number of Crown Posters they can display. The dimensions for a Crown Poster are 412.8 x 533.4 mm.

Referencing details: Number of sheets or dimensions.

Cost information notes: Costs as per non-illuminated. Price includes supply, installation and delivery charges. Add for planning application fee.

Agricultural Buildings

CG Code: 50A00X

Specific: Flat Grain Store

Descriptive: Steel portal frame, walls clad with sheet metal profile cladding and concrete thrust (push) walls, roofs clad with cement fibre roof sheets. Roof may incorporate translucent roof lights

Tech 1: 500m²

Tech 2: Eaves Height 6m

Unit size: 500m²

Unit of measurement: m2

ERC: £808

Superseded codes: 98B031

Location factor: Location Adjustment Applicable (See Guidance Notes) - ERC = UK mean of 1.00

Description: Steel portal frame unheated, uninsulated, usually no natural light, walls clad with uninsulated profiled metal sheet cladding and roofs clad with fibre cement sheets, concrete slab floor, may or may not have doors. So that bulk products can be stored to a reasonable height, flat grain stores will have thrust walls (sometimes called grain walls) to a height of approx. 2.50 – 3.65 metres. May have a vented floor to aerate the product, but most have fans in the thrust walls and venting is by means of removable pipes. The manufacturers tend to refer to flat grain stores in terms of their storage capacity, e.g. 1000 tonnes, 2500 tonnes. etc. Can be used in conjunction with vertical grain stores such as silos. See also Rating Manual Valuation Practice - Section 460 Grain Silos and Practice Note - Grain Stores and Grain Silos. Note: Agricultural buildings may have multi-functional uses dependant on the seasons and how the farm is worked/managed.

Referencing details: Measure to GIA, record eaves height. Photograph internally and externally. Referencers/valuers to record all details of adjacent silos/equipment/plant and machinery used in conjunction with the flat grain store. Ascertain additional plant and equipment present such as aerators, temperature and humidity controls. Flat grain stores can be assessed for rating using either the rental method or using contractors method. Reference should therefore be made to the applicable Rating Manual Guidance and Practice Note to determine the correct valuation method to be adopted.

Cost information notes: Cost based on basic steel portal frame construction, clad to walls with single skin uninsulated steel profile sheet, roofs clad with cement fibre roof sheets, typically rectangular in plan, 6m eaves height with basic power and lighting, manually operated roller shutter door and 1no personnel door. For adjustments see also variations. For flat grain stores in excess of 500m² contact BEAMs team for further guidance.

Rateable element: Refer to Rating Manual Section 5a Valuation of all Property Classes Grain Stores and silos

Non-rateable element: See Practice Note - Grain Stores and Grain Silos

Adjusted plant and machinery: Silos (Vertical Grain Stores) - May have auto fillers, temperature and moisture control plant, testing equipment, electrical roller shutter doors.

Number of items adjusted: Referencer to ascertain on-site number of adjoining items - Refer to Rating Manual and Practice Note.

Contract size adjustment: See Appendix BEAMS Note 2

Variations: For adjustments apply 7% reduction for basic industrial sheds open one long side. Apply 5% reduction or increase for variations in height (1m) from beacon eaves height of 6.0m

Agricultural Buildings

CG Code: 605MO1

Specific: Unheated and Uninsulated Basic Shed

Descriptive: Steel Profiled Single Skin Wall Cladding

Tech 1: 0 - 500m²

Tech 2: Eaves Height 6.0m

Unit size: 500m²

Unit of measurement: m2

ERC: £619

Superseded codes: -

Location factor: Location Adjustment Applicable (See Guidance Notes) - ERC = UK mean of 1.00

Description: Basic unheated, uninsulated shell construction, open plan internally. Internal facilities such as toilets and tearoom are not provided to this category of property. Building construction: Single storey steel portal frame comprising universal columns and universal beams supported on concrete pad foundations. Reinforced concrete ground floor slab, no upper floors or mezzanine. Standard steel uninsulated single skin trapezoidal profile external wall and roof cladding. Natural light via translucent roof sheets to approx. 10% of roof area. One personnel door and one roller shutter door provided. Services comprise basic single phase power (assumed 2nr double socket outlets and 4nr light fittings per every 100m²). No water supply or foul drainage provision. Average weight of Steel for buildings up to 20m high (Average 3m per floor) up to 6 storeys = (35-40)/2 = 37.5kg/m2 floor area.

Referencing details: Measure to GIA. Measure eaves height. Photograph internally and externally.

Cost information notes: Cost based on basic steel portal frame construction, clad to roof and walls with single skin uninsulated steel profile sheet, typically rectangular in plan, 6m eaves height with basic power and lighting, manually operated roller shutter door and 1nr personnel door. Adjustments, see also variations, apply 7% reduction for basic industrial sheds open one long side with no roller shutter or personnel doors. Apply 5% reduction or increase for variations in height (1m) from beacon eaves height of 6.0m

Rateable element: Refer to Rating Manual Section 5a Valuation of all Property Classes Factories, Workshops and Warehouses.

Non-rateable element: Refer to Rating Manual Section 5a Valuation of all Property Classes Factories, Workshops and Warehouses.

Adjusted plant and machinery: None

Air

CG Code: 201A01

Specific: Compressors

Descriptive: Piston 7.5 Bar

Tech 1: 25 m^3 / hr

Tech 2: 15 ft^3 / min

Unit size: -

Unit of measurement: Each

ERC: £837

Superseded codes: -

Location factor: Considered Not Applicable at time of Publication

Description: Piston Air Compressor Air Compressors - Machine for compressing air by means of pistons Usually electrically driven but could be steam turbine or diesel engine driven. The piston compressor is commonly found in medium to large industrial complexes. The storage cylinder (receiver) is located away from the compressor and between the two are usually air filters and air dryers pressures usually 7 Bar or greater. For low pressures the unit may be a single piston. The compressor switches on when the pressure in the receiver is below the pre-set figure.

Referencing details: 1.The Type (piston) 2.The pressure in the cylinder Bar 3.The output of the system cubic m / hour 4.The size of the motor 5.Age Cubic ft/min x 1.699 = cubic m/hour If the only information available is the size of the motor :- To find cubic m/hour from hp of motor x by 7.6 (approx.) To find cubic ft/min from hp of motor x by 4.5 (approx.) Note the information above is approximate and should be used with care. The motors work at 1450 rpm generally.

Cost information notes: Costs include instrumentation, after cooler, motor. The air receiver is NOT included. Larger sized piston compressors are now generally being replaced by screw type compressors.

Rateable element: Class 1 Table 1 (i) Air Compressor (Class 1 and 2) List of Accessories 2 (ii) - Compressors

Non-rateable element: Air compressors that are rateable within class 1 or class 2 are rateable in their entirety.

Adjusted plant and machinery: Foundations, supports (steelworks), storage cylinder (air receiver), air driers, filters and mains pipe work.

Number of items adjusted: The item can typically be found on an industrial, commercial or office complex. Some hereditaments may have multiple items, in which case the ERC needs to reflect the number of items.

Contract size adjustment: See Appendix BEAMS Note 1

The storage cylinder (receiver) is located away from the compressor and between the two are usually air filters and air dryers pressures usually 7 Bar or greater. For low pressures the unit may be a single piston. The compressor switches on when the pressure in the receiver is below the pre-set figure.

Referencing details: 1.The Type (piston) 2.The pressure in the cylinder Bar 3.The output of the system cubic m / hour 4.The size of the motor 5.Age Cubic ft/min x 1.699 = cubic m/hour If the only information available is the size of the motor :- To find cubic m/hour from hp of motor x by 7.6 (approx.) To find cubic ft/min from hp of motor x by 4.5 (approx.) Note the information above is approximate and should be used with care. The motors work at 1450 rpm generally.

Cost information notes: Costs include instrumentation, after cooler, motor. The air receiver is NOT included. Larger sized piston compressors are now generally being replaced by screw type compressors.

Rateable element: Class 1 Table 1 (i) Air Compressor (Class 1 and 2) List of Accessories 2 (ii) - Compressors

Non-rateable element: Air compressors that are rateable within class 1 or class 2 are rateable in their entirety.

Adjusted plant and machinery: Foundations, supports (steelworks), storage cylinder (air receiver), air driers, filters and mains pipe work.

Number of items adjusted: The item can typically be found on an industrial, commercial or office complex. Some hereditaments may have multiple items, in which case the ERC needs to reflect the number of items.

Contract size adjustment: See Appendix BEAMS Note 1

For low pressures this unit may be a single piston. The compressor switches on when the pressure in the receiver is below the pre-set figure.

Referencing details: 1.The Type (piston) 2.The pressure in the cylinder Bar 3.The output of the system cubic m / hour 4.The size of the motor 5.Age Cubic ft/min x 1.699 = cubic m/hour If the only information available is the size of the motor :- To find cubic m/hour from hp of motor x by 7.6 (approx.) To find cubic ft/min from hp of motor x by 4.5 (approx.) Note the information above is approximate and should be used with care. The motors work at 1450 rpm generally.

Cost information notes: Costs include instrumentation, after cooler, motor. The air receiver is NOT included. Larger sized piston compressors are now generally being replaced by screw type compressors.

Rateable element: Class 1 Table 1 (i) Air Compressor (Class 1 and 2) List of Accessories 2 (ii) - Compressors

Non-rateable element: Air compressors that are rateable within class 1 or class 2 are rateable in their entirety.

Adjusted plant and machinery: Foundations, supports (steelworks), storage cylinder (air receiver), air driers, filters and mains pipe work.

Number of items adjusted: The item can typically be found on an industrial, commercial or office complex. Some hereditaments may have multiple items, in which case the ERC needs to reflect the number of items.

Contract size adjustment: See Appendix BEAMS Note 1

Description: Rotary Screw Air Compressor Air Compressors - Machine for compressing air by means of interlocking screws Usually electrically driven but could be steam turbine or diesel engine driven. This rotary screw compressor is commonly found where the requirement is for small to medium pressures. It is not often employed where very high pressures are required. It is quieter in operation than a comparable piston compressor and thus it is not necessarily found in a power-house (as most large piston compressors are) The storage cylinder (receiver) is located away from the compressor and between the two is usually air filters and air dryers. Smaller units produce pressures in the 7 Bar to 8 bar range. The compressor switches on when the pressure in the receiver is below the pre-set figure.

Referencing details: 1.The Type (rotary screw) 2.The pressure in the cylinder Bar 3.The output of the system cubic m / hour 4.The size of the motor 5.Age This type of unit is usually enclosed in a cabinet. Most cabinets have a specification plate on the outside but where this is not available ask the engineer on-site or look to the pressure on the adjacent air receiver. Never open a cabinet to obtain information from the plates attached to the individual machines. Cubic ft/min x 1.699 = cubic m/hour

Cost information notes: Costs include instrumentation, after cooler, motor. The air receiver is NOT included. Larger sized piston compressors are now generally being replaced by screw type compressors.

Description: Rotary Screw Air Compressor Air Compressors - Machine for compressing air by means of interlocking screws Usually electrically driven but could be steam turbine or diesel engine driven. This rotary screw compressor is commonly found where the requirement is for small to medium pressures. It is not often employed where very high pressures are required. It is quieter in operation than a comparable piston compressor and thus it is not necessarily found in a power-house (as most large piston compressors are) The storage cylinder (receiver) is located away from the compressor and between the two is usually air filters and air dryers. Smaller units produce pressures in the 7 Bar to 8 bar range. The compressor switches on when the pressure in the receiver is below the pre-set figure.

Referencing details: 1.The Type (rotary screw) 2.The pressure in the cylinder Bar 3.The output of the system cubic m / hour 4.The size of the motor 5.Age This type of unit is usually enclosed in a cabinet. Most cabinets have a specification plate on the outside but where this is not available ask the engineer on-site or look to the pressure on the adjacent air receiver. Never open a cabinet to obtain information from the plates attached to the individual machines. Cubic ft/min x 1.699 = cubic m/hour

Cost information notes: Costs include instrumentation, after cooler, motor. The air receiver is NOT included. Larger sized piston compressors are now generally being replaced by screw type compressors.

Rateable element: Class 1 Table 1 (i) Air Compressor (Class 1 and 2) List of Accessories 2 (ii) - Compressors

Non-rateable element: Air compressors that are rateable within class 1 or class 2 are rateable in their entirety.

Description: Rotary Screw Air Compressor - Machine for compressing air by means of interlocking screws Usually electrically driven but could be steam turbine or diesel engine driven. This rotary screw compressor is commonly found where the requirement is for small to medium pressures. It is not often employed where very high pressures are required. It is quieter in operation than a comparable piston compressor and thus it is not necessarily found in a power-house (as most large piston compressors are) The storage cylinder (receiver) is located away from the compressor and between the two is usually air filters and air dryers. Smaller units produce pressures in the 7 Bar to 8 bar range. The compressor switches on when the pressure in the receiver is below the pre-set figure.

Referencing details: 1.The Type (rotary screw) 2.The pressure in the cylinder Bar 3.The output of the system cubic m / hour 4.The size of the motor 5.Age This type of unit is usually enclosed in a cabinet. Most cabinets have a specification plate on the outside but where this is not available ask the engineer on-site or look to the pressure on the adjacent air receiver. Never open a cabinet to obtain information from the plates attached to the individual machines. Cubic ft/min x 1.699 = cubic m/hour

Cost information notes: Costs include instrumentation, after cooler, motor. The air receiver is NOT included.

Rateable element: Class 1 Table 1 (i) Air Compressor (Class 1 and 2) List of Accessories 2 (ii) - Compressors

Non-rateable element: Air compressors that are rateable within class 1 or class 2 are rateable in their entirety.

Adjusted plant and machinery: Foundations, supports (steelworks), storage cylinder (air receiver), air driers, filters and mains pipe work.

Number of items adjusted: The item can typically be found on an industrial, commercial or office complex. Some hereditaments may have multiple items, in which case the ERC needs to reflect the number of items.

Contract size adjustment: See Appendix BEAMS Note 1

Description: Cylinder mounted piston air compressor, a machine for compressing air by means of a piston. This is usually electrically driven with the compressor and motor mounted on the air receiver (storage cylinder). Commonly found in car garages and small factories.

Referencing details: 1.The Type (cylinder mounted) 2.The pressure in the cylinder Bar 3.The output of the system cubic m / hour 4.The size of the motor 5.Age Cubic ft/min x 1.699 = cubic m/hour If the only information available is the size of the motor :- To find cubic m/hour from hp of motor x by 7.6 (approx.) To find cubic ft/min from hp of motor x by 4.5 (approx.) Note the information above is approximate and should be used with care.

Cost information notes: -

Rateable element: Class 1 Table 1(i) Air Compressor (Class 1 and 2) List of Accessories 2 (ii)

Non-rateable element: Air compressors that are rateable within class 1 or class 2 are rateable in their entirety.

Adjusted plant and machinery: Foundations, supports (steelworks), storage cylinder (air receiver), air driers, filters and mains pipe work.

Number of items adjusted: The item can typically be found on an industrial, commercial or office complex. Some hereditaments may have multiple items, in which case the ERC needs to reflect the number of items.

Contract size adjustment: See Appendix BEAMS Note 1

Descriptive: Rotary screw 12.5 bar

Tech 1: 15KW

Tech 2: 109 ft³ / min

Unit size: -

Unit of measurement: Each

ERC: £16,185

Superseded codes: -

Location factor: Considered Not Applicable at time of Publication

Description: Rotary Screw Air Compressor Air Compressors - Machine for compressing air by means of interlocking screws Usually electrically driven but could be steam turbine or diesel engine driven. This rotary screw compressor is commonly found where the requirement is for small to medium pressures. It is not often employed where very high pressures are required. It is quieter in operation than a comparable piston compressor and thus it is not necessarily found in a power-house (as most large piston compressors are) The storage cylinder (receiver) is located away from the compressor and between the two is usually air filters and air dryers. Smaller units produce pressures in the 7 Bar to 8 bar range. The compressor switches on when the pressure in the receiver is below the pre-set figure.

Referencing details: 1.The Type (rotary screw) 2.The pressure in the cylinder Bar 3.The output of the system cubic m / hour 4.The size of the motor 5.Age This type of unit is usually enclosed in a cabinet. Most cabinets have a specification plate on the outside but where this is not available ask the engineer on-site or look to the pressure on the adjacent air receiver. Never open a cabinet to obtain information from the plates attached to the individual machines. Cubic ft/min x 1.699 = cubic m/hour

Cost information notes: Costs include instrumentation, after cooler, motor. The air receiver is NOT included. Larger sized piston compressors are now generally being replaced by screw type compressors.

Rateable element: Class 1 Table 1 (i) Air Compressor (Class 1 and 2) List of Accessories 2 (ii) - Compressors

Non-rateable element: Air compressors that are rateable within class 1 or class 2 are rateable in their entirety.

Description: Cylinder Mounted Screw Compressor. Machine for compressing air by means of rotary screws, Usually electrically driven this type of compressor is commonly found in car garages and small factories. The motor and piston are mounted on the storage cylinder (receiver). The compressor switches on when the pressure in the receiver is below the pre-set figure.

Referencing details: 1.The Type (screw) 2.The pressure in the cylinder Bar 3.The output of the system cubic m / hour 4.The size of the motor 5.Age Cubic ft/min x 1.699 = cubic m/hour If the only information available is the size of the motor :- To find cubic m/hour from hp of motor x by 7.6 (approx.) To find cubic ft/min from hp of motor x by 4.5 (approx.) Note the information above is approximate and should be used with care. The motors work at 1450 rpm

Cost information notes: Costs include instrumentation, after cooler, motor. The air receiver is NOT included. Larger sized piston compressors are now generally being replaced by screw type compressors.

Rateable element: Class 1 Table 1 (i) Air Compressor (Class 1 and 2) List of Accessories 2 (ii) - Compressors

Non-rateable element: Air compressors that are rateable within class 1 or class 2 are rateable in their entirety.

Adjusted plant and machinery: Foundations, supports (steelworks), storage cylinder (air receiver), air driers, filters and mains pipe work.

Number of items adjusted: The item can typically be found on an industrial, commercial or office complex. Some hereditaments may have multiple items, in which case the ERC needs to reflect the number of items.

Contract size adjustment: See Appendix BEAMS Note 1

Description: An air receiver is a storage cylinder for air at high pressure, it is made from a thick gauge of steel to withstand the pressure. It is situated after the air compressor and air dryer but before the machinery requiring compressed air. Larger sizes will require additional foundations due to their weight. A gauge showing the air pressure is usually attached and a plate will indicate the size / capacity and maximum safe working pressure in Bar.

Referencing details: Size does not matter as they are rated under list of accessories 2 (ii) or (v) Record 1. Pressure (bar) 2. Diameter 3. Height 4. Age Record if pressure gauge is attached and if concrete foundation is provided i.e. not just resting on factory floor.

Cost information notes: -

Description: Air Pipes - Mains. Regard has to be had to the Class 1 pre- amble at (c) (iii). In the case of pneumatic power, the point where the mains supply ceases, excluding branch service piping connected with such main supply. The greater the distance from the air receiver the smaller the mains pipe becomes to avoid pressure loss i.e. it may reduce from 40 mm to 25 mm. Nevertheless this is still the main pipe. Branches are usually evident in that they are often flexible or non-steel pipes. Where systems are complex, runs are long and/or there are several off takes, non-return valves, etc. fitted.

Referencing details: The compressed air pipe colour is light blue and where pipes are galvanised (silver grey). Often a light blue bandage is put round the pipe stating what is in the pipe and the direction of flow. Where return and flow valves are installed,, the costs take account of this. Where details of pipe runs are poor and the pipe is of 65mm/100mm diameter with basic strap supports adopt 201C20 / 201C21 and assume length of 250m. Mains pipe can be between air compressor and air dryer / air receiver or the air receiver and the flexible branch. NOTE 1.Pipe diameter . 2.Length of main. 3.Between what? i.e. air receiver and flexible branch. 4.If valves are within pipe. 5.Age.

Cost information notes: It is likely that valves will be present in the larger mains around the air compressor and the receiver. No separate addition is required for small diameter bends but near air compressor where the pipe is 100 mm diam or greater, the cost is significant and details of the pipe dia. and number should be recorded. Where full details are not readily to hand to cost see item code 201C20 - 201C21 Where full details are known see 201C01 etc.

Rateable element: List of Accessories 2(v) pipes, valves - if necessary, to Class 1 or 2 rateable plant Class 1 (iii) up to and including the point where the main supply ends.

Non-rateable element: Class 1 (iii) any branch service piping connected with such main supply. Whole if not used in connection with Class 1 or 2 rateable plant.

Adjusted plant and machinery: Air compressor, air receiver, foundations, supports, pipe gantries.

Number of items adjusted: The item can typically be found on an industrial, commercial or office complex. Some hereditaments may have multiple items, in which case the ERC needs to reflect the number of items.

Contract size adjustment: See Appendix BEAMS Note 1

NOTE 1.Pipe diameter . 2.Length of main. 3.Between what? i.e. air receiver and flexible branch. 4.If valves are within pipe. 5.Age.

Cost information notes: It is likely that valves will be present in the larger mains around the air compressor and the receiver. No separate addition is required for small diameter bends but near air compressor where the pipe is 100 mm diam or greater, the cost is significant and details of the pipe dia. and number should be recorded. Where full details are not readily to hand to cost see item code 201C20 - 201C21 Where full details are known see 201C01 etc.

Rateable element: List of Accessories 2(v) pipes, valves - if necessary, to Class 1 or 2 rateable plant Class 1 (iii) up to and including the point where the main supply ends.

Non-rateable element: Class 1 (iii) any branch service piping connected with such main supply. Whole if not used in connection with Class 1 or 2 rateable plant.

Adjusted plant and machinery: Air compressor, air receiver, foundations, supports, pipe gantries.

Number of items adjusted: The item can typically be found on an industrial, commercial or office complex. Some hereditaments may have multiple items, in which case the ERC needs to reflect the number of items.

Contract size adjustment: See Appendix BEAMS Note 1

Variations: -

Air

CG Code: 201C20

Specific: Pipes

Descriptive: General pipework

Tech 1: 65mm diameter

Tech 2: Excludes internal valves

Unit size: -

Unit of measurement: m

ERC: £48

Superseded codes: -

Location factor: Considered Not Applicable at time of Publication

Description: Air Pipes - Mains. Regard has to be had to the Class 1 pre- amble at (c) (iii). In the case of pneumatic power, the point where the mains supply ceases, excluding branch service piping connected with such main supply. The greater the distance from the air receiver the smaller the mains pipe becomes to avoid pressure loss i.e. it may reduce from 40 mm to 25 mm. Nevertheless this is still the main pipe. Branches are usually evident in that they are often flexible or non-steel pipes. Where systems are complex, runs are long and/or there are several off takes, non-return valves, etc. fitted.

Referencing details: The compressed air pipe colour is light blue and where pipes are galvanised (silver grey). Often a light blue bandage is put round the pipe stating what is in the pipe and the direction of flow. Where return and flow valves are installed, the costs take account of this. Where details of pipe runs are poor and the pipe is of 65mm/100mm diameter with basic strap supports adopt 201C20 / 201C21 and assume length of 250m. Mains pipe can be between air compressor and air dryer / air receiver or the air receiver and the flexible branch. NOTE 1.Pipe diameter . 2.Length of main. 3.Between what? i.e. air receiver and flexible branch. 4.If valves are within pipe. 5.Age.

Cost information notes: It is likely that valves will be present in the larger mains around the air compressor and the receiver. Tech 1: 170m³/hr

Tech 2: -

Unit size: -

Unit of measurement: Each

ERC: £3,330

Superseded codes: -

Location factor: Considered Not Applicable at time of Publication

Description: Air Dryers are situated between the air compressor and the air receiver. The Air Dryer takes the moisture out of the compressed air. This helps to prevent rust forming in the air receiver and mild steel distribution pipes. There are 3 main types, refrigerant, desiccant and desiccant drum type. Refrigerant dryers are the most common. These units can be a variety of shapes and sizes. For high pressures or where large volumes of air are continuously required the units are larger and more complex in nature. The size of the air dryer is based on the amount of air cu m / hour that is passing through the system.

Referencing details: -

Cost information notes: Costings are based on refrigerant type dryers as desiccant types are less common and slightly more costly.

Rateable element: List of accessories 2. (v) coolers, purifying and other treatment apparatus, separators, filters.

Non-rateable element: Air filters that are rateable within class 1 or class 2 are rateable in their entirety.

Adjusted plant and machinery: Air compressors, storage cylinders and vessels (air receivers), air mains pipework.

Air

CG Code: 201D72

Specific: Dryers

Descriptive: Gas 14 bar

Tech 1: 70m³/hr

Tech 2: -

Unit size: -

Unit of measurement: Each

ERC: £1,860

Superseded codes: -

Location factor: Considered Not Applicable at time of Publication

Description: Air Dryers are situated between the air compressor and the air receiver. The Air Dryer takes the moisture out of the compressed air. This helps to prevent rust forming in the air receiver and mild steel distribution pipes. There are 3 main types, refrigerant, desiccant and desiccant drum type. Refrigerant dryers are the most common. These units can be a variety of shapes and sizes. For high pressures or where large volumes of air are continuously required the units are larger and more complex in nature. The size of the air dryer is based on the amount of air cu m / hour that is passing through the system.

Referencing details: -

Cost information notes: Costings are based on refrigerant type dryers as desiccant types are less common and slightly more costly.

Rateable element: List of accessories 2. (v) coolers, purifying and other treatment apparatus, separators, filters.

Non-rateable element: Air filters that are rateable within class 1 or class 2 are rateable in their entirety.

Adjusted plant and machinery: Air compressors, storage cylinders and vessels (air receivers), air mains pipework.

Number of items adjusted: The item can typically be found on an industrial, commercial or office complex. Some hereditaments may have multiple items, in which case the ERC needs to reflect the number of items.

Tech 1: 20m³/hr

Tech 2: -

Unit size: -

Unit of measurement: Each

ERC: £322

Superseded codes: -

Location factor: Considered Not Applicable at time of Publication

Description: Air Filters are situated between the air compressor and the air receiver. Fine particles of oil and metal can be found after compression and the Air Filter ensures the system is free from such impurities. The air filters usually have bleeding valves at the bottom to clear the filter of impurities. The very small filters unscrew and the filter is manually changed on a regular basis. These filters have to be manually replaced over a fixed maintenance period. Larger filters are to some degree self-cleansing when flows are reversed and the offending material is collected and drained out. These systems also require regular maintenance.

Referencing details: The size of the air filter is based on the amount of air cu m / hour that is passing through the system. 1.The size / type 2.The cubic m / hour 3.The pressure of the system (bar) 4.The age

Cost information notes: In many cases there are no details in respect of the air filter just one or a series of "bottles" as part the air mains. In such cases adopt the cost 201E13

Rateable element: Class 1 Table 1 (I) Air compressors. [Must be used in connection with] List of Accessories 2 (v) separators, filters, coolers, Purifying and other.

Non-rateable element: Must be used in conjunction with class 1 item.

Adjusted plant and machinery: Air compressors, storage cylinders & vessels and mains pipe work.

Number of items adjusted: The item can typically be found on an industrial, commercial or office complex. Some hereditaments may have multiple items, in which case the ERC needs to reflect the number of items.

Location factor: Considered Not Applicable at time of Publication

Description: Piston Air Compressor Air Compressors - Machine for compressing air by means of pistons Usually electrically driven but could be steam turbine or diesel engine driven. This piston compressor is commonly found in medium to large industrial complexes. The storage cylinder (receiver) is located away from the compressor and between the two are usually air filters and air dryers pressures usually 7 Bar or greater. For low pressures this unit may be a single piston. The compressor switches on when the pressure in the receiver is below the pre-set figure.

Referencing details: 1.The Type (piston) 2.The pressure in the cylinder Bar 3.The output of the system cubic m / hour 4.The size of the motor 5.Age Cubic ft/min x 1.699 = cubic m/hour If the only information available is the size of the motor :- To find cubic m/hour from hp of motor x by 7.6 (approx.) To find cubic ft/min from hp of motor x by 4.5 (approx.) Note the information above is approximate and should be used with care. The motors work at 1450 rpm generally.

Cost information notes: Costs include instrumentation, after cooler, motor. The air receiver is NOT included. Larger sized piston compressors are now generally being replaced by screw type compressors.

Rateable element: Class 1 Table 1 (i) Air Compressor (Class 1 and 2) List of Accessories 2 (ii) - Compressors

Non-rateable element: Air compressors that are rateable within class 1 or class 2 are rateable in their entirety.

ERC: £1,296

Superseded codes: -

Location factor: Considered Not Applicable at time of Publication

Description: Air Dryers are situated between the air compressor and the air receiver. The Air Dryer takes the moisture out of the compressed air. This helps to prevent rust forming in the air receiver and mild steel distribution pipes. There are 3 main types, refrigerant, desiccant and desiccant drum type. Refrigerant dryers are the most common. These units can be a variety of shapes and sizes. For high pressures or where large volumes of air are continuously required the units are larger and more complex in nature. The size of the air dryer is based on the amount of air cu m / hour that is passing through the system.

Referencing details: -

Cost information notes: Costings are based on refrigerant type dryers as desiccant types are less common and slightly more costly.

Rateable element: List of accessories 2. (v) coolers, purifying and other treatment apparatus, separators, filters.

Non-rateable element: Air filters that are rateable within class 1 or class 2 are rateable in their entirety.

Adjusted plant and machinery: Air compressors, storage cylinders and vessels (air receivers), air mains pipework.

Number of items adjusted: The item can typically be found on an industrial, commercial or office complex. Some hereditaments may have multiple items, in which case the ERC needs to reflect the number of items.

Contract size adjustment: See Appendix BEAMS Note 1

Air Conditioning

CG Code: 217A02

Specific: Cassettes

Descriptive: Cooling Only

Tech 1: 7.2kw

Tech 2: No Fresh Air Provision

Unit size: Each unit has label with cooling capacity rating in KW

Unit of measurement: Each

ERC: £5,204

Superseded codes: -

Location factor: Considered Not Applicable at time of Publication

Description: Indoor unit (evaporator) and outdoor unit (condenser) considered as one system. Indoor unit can be ceiling mounted or wall hung with local / wall hung controller. Outdoor unit to be wall hung or floor/roof mounted with inter connecting refrigerant piping and electrical cabling with local isolator. Indoor unit to have pumped or gravity flow condensate water connected to a drain or wall discharge.

Referencing details: Record the number of indoor/outdoor units, capacity (from name plate) and locations. Typical area cover to be approximately 50 sq.m but make a record on actual area coverage on-site.

Cost information notes: Cost includes the indoor unit, outdoor unit, all pipes, wiring and controller.

Rateable element: Class 2 table 2(b) with accessories listed.

Non-rateable element: -

Adjusted plant and machinery: Other services like Fans, AHU, cabling, piping.

Number of items adjusted: Varies

Contract size adjustment: See Appendix BEAMS Note 1

Variations: Ceiling or wall hung indoor unit. Wall, roof or floor mounted external unit.

Unit of measurement: m2

ERC: £1,866

Superseded codes: 60F00C, 60F00D

Location factor: Location Adjustment Applicable (See Guidance Notes) - ERC = UK mean of 1.00

Description: Single or multi-storey building containing garage and preparation areas for vehicles with associated stores, staff locker, changing and mess rooms with toilet facilities and ancillary spaces such as plant rooms. Other accommodation, such as administration offices, meeting rooms or training facilities may also be present. Commonly of framed construction with cladding to elevations surmounted by a pitched roof. Internal finishes and fixtures vary depending on accommodation usage with minimal finishes to vehicle areas and painted plaster walls, carpet tile covered floors and suspended ceilings to office or training areas. Services comprise central heating, lighting and power, sanitary and plumbing installations, data, communication and security installations, fire detection and alarm systems. In addition, air conditioning, lifts and various sustainable features, such as photovoltaic panels, may be present.

Referencing details: GIA - Gross internal area.

HM Revenue & Customs | Valuation Office

Berm

CG Code: 208F01

Specific: Hazard containment

Descriptive: Earth bank

Tech 1: Central core of brick, concrete or steel

Tech 2: 3m high x 1 m wide at top

Unit size: Linear Metre

Unit of measurement: m

ERC: £2,215

Superseded codes: -

Location factor: Location Adjustment Applicable (See Guidance Notes) - ERC = UK mean of 1.00

Description: An earth bund is usually a low bank built to contain leaks or spillage from, for example, a free standing fuel tank. Earth bunds are often identical to berms but may be shallower and do not usually act as blast protection. See Bunds- 33U40P. Embankment Wall, reinforced with Tensar Uniaxial Geogrid at 55Kn/m, laid horizontally to 100% vertical height of slope at 1.0 m centres, filling - excavated material spoil composted in layers

Referencing details: 1. The height (vertically). 2. The width at the base. 3. What it is covered with e.g. grass, earth, boulders. 4. Length. 5. Age. 6. Width at top. 7. Slope length (base top).

Cost information notes: This cost is based on the assumption that the bund is built on a site cleared of organic topsoil and having normal load bearing capacity. See also variations

Rateable element: Class 2 Table 2(f) Protection from Hazards. Bunds, blast protection walls, berms.

Non-rateable element: Under Class 2 if they are not used or intended to be used mainly or exclusively in connection with services. e.g. Landscaping mounds or natural embankment

Adjusted plant and machinery: -

Number of items adjusted: Tanks, settings.

Contract size adjustment: See Appendix BEAMS Note 2

Variations: Surface area within bund maybe gravel or stone finished. Use code 33U1QA

Bitsand Bases

CG Code: 215J04

Specific: Raised pad of compacted fill on competent ground

Descriptive: 100mm thick layer of Bitsand Base

Tech 1: 12m Tank Base Diameter

Tech 2: -

Unit size: <12m Diameter

Unit of measurement: m2

ERC: £816

Superseded codes: None

Location factor: Location Adjustment Applicable (See Guidance Notes) - ERC = UK mean of 1.00

Description: Tanks are normally constructed on a raised pad of free-draining granular material such as crushed stone to provide for drainage and to deter tank bottom corrosion. An asphalt or oil-sand seal is provided to the surface of the pad thus formed to prevent infiltration of water which could increase the rate of corrosion of the bottom plates. If a tank pad is not constructed out of free-draining material, then precautions to limit corrosion can be effected by providing the tank with a 100mm thick layer of oil-sand.

Referencing details: Refer to RM section 5a Liquid Bulk Storage Depots Practice Note 2026 - petrol and oil storage depots

Cost information notes: The unit of measure is based on the tank base diameter in square metres. It has been assumed that the raised tank pad extends approx. 1m beyond the tank wall and this has been included in the rate. The cost build up includes for 100mm unreinforced concrete bed blinded with a 100mm thick layer of bitsand.

Rateable element: Refer to RM section 5a Liquid Bulk Storage Depots Practice Note 2026 - petrol and oil storage depots

Non-rateable element: Refer to RM section 5a Liquid Bulk Storage Depots Practice Note 2026 - petrol and oil storage depots

Adjusted plant and machinery: See RM Section 5: Part 3 for general advice on identification of rateable plant and machinery forming part of the hereditament. Rateable plant and machinery are identified in accordance with the provisions of SI 2000 No. 540 in England and SI 2000 No. 1097 (W.75) in Wales.

Number of items adjusted: Refer to RM section 5a Liquid Bulk Storage Depots Practice Note 2026 - petrol and oil storage depots

Bitsand Bases

CG Code: 215J05

Specific: Raised pad of compacted fill on competent ground

Descriptive: 100mm thick layer of Bitsand Base

Tech 1: 13-15m Tank Base Diameter

Tech 2: -

Unit size: 13-15m Diameter

Unit of measurement: m2

ERC: £918

Superseded codes: None

Location factor: Location Adjustment Applicable (See Guidance Notes) - ERC = UK mean of 1.00

Description: Tanks are normally constructed on a raised pad of free-draining granular material such as crushed stone to provide for drainage and to deter tank bottom corrosion. An asphalt or oil-sand seal is provided to the surface of the pad thus formed to prevent infiltration of water which could increase the rate of corrosion of the bottom plates. If a tank pad is not constructed out of free-draining material, then precautions to limit corrosion can be effected by providing the tank with a 100mm thick layer of oil-sand.

Referencing details: Refer to RM section 5a Liquid Bulk Storage Depots Practice Note 2026 - petrol and oil storage depots

Unit size: Each Plant/system

Unit of measurement: Each

ERC: £4,092,541

Superseded codes: -

Location factor: Considered Not Applicable at time of Publication

Description: Steam Boilers usually fired by gas or oil, which are capable of operation at high pressures. Natural gas, Waste gas, Gas oil, refuse or coal products may be utilised as fuel. The boilers usually have super heaters (to allow high pressure and temperatures to be reached) and economisers (to pre heat the feed water). Fired by oil or gas (see new coal dust burning boilers being installed,) to usually heat the water in tubes in a drum. Steam boilers are usually high pressure. Steam taken under pressure to drive machines direct, and when pressure is let down to heat buildings or to be used in the process. Cost excludes flues, precipitators, foundations, fuel handling and civil engineering. Often capacity of boiler given expressed as lb/hour of steam raised i.e. that which a boiler can evaporate at full load output. Large boilers are designated in tonnes/hour e.g. 600 000 lb/hour 2 tonnes per hour The temperature at which the boiler operates should be noted e.g. 3500C and the pressure at which the steam is generated (e.g. 1500 psig) A small boiler will evaporate 2,000 lb/hour. A large industrial boiler 100,000 lb/hour If a boiler is rated in Btu/hr (it is usually for hot water) it can be converted in lb/hours taking: 1000 Btu/hr = 1lb/hour 3412 Btu/hr = 1KW/hour Often maximum ratings lb/hour are stated on the machine but this is NOT the normal working rating but the maximum allowing for safety margins. Calculate values on the working rate only but have a note of the maximum rate especially if it is substantially greater that the present operating rate. lb/sq inch This is the working pressure of the boiler and under 250lb/sq in is regarded as low pressure and over 300lb/sq in as high pressure. Low Pressure -Heating and process steam High Pressure-Driving (power) and process steam 1 Bar = 14.5 psig (at atmosphere) psig General: Hot water boiler-Rated in btu/hour Steam boilers-Rated in evaporated lbs/hour

Referencing details: Dimensions and working pressure/temperatures

Cost information notes: -

Non-rateable element: (i) Process Boiler ss rateable under Class 4 Table 4 and passes "structure" tests

Adjusted plant and machinery: Generator, Compressor, Foundations, Pits, Tanks, supports, Settings, Economisers, Super heaters

Number of items adjusted: The item can typically be found on an industrial, commercial or office complex. Some hereditaments may have multiple items, in which case the ERC needs to reflect the number of items.

Contract size adjustment: See Appendix BEAMS Note 1

Variations: NB: add 15-20% for economiser and super heaters

Boilers

CG Code: 202A10

Specific: High pressure - water tube

Descriptive: Class 1 Table 1 - including List of Accessories

Tech 1: Evp lb/hr x 1000 150

Tech 2: 900 Psig

Unit size: Each Plant/system

Unit of measurement: Each

ERC: £5,736,800

Superseded codes: -

Location factor: Considered Not Applicable at time of Publication

Description: Steam Boilers usually fired by gas or oil, which are capable of operation at high pressures. Natural gas, Waste gas, Gas oil, refuse or coal products may be utilised as fuel. The boilers usually have super heaters (to allow high pressure and temperatures to be reached) and economisers (to pre heat the feed water). Fired by oil or gas (see new coal dust burning boilers being installed,) to usually heat the water in tubes in a drum. Steam boilers are usually high pressure. Steam taken under pressure to drive machines direct, and when pressure is let down to heat buildings or to be used in the process. Cost excludes flues, precipitators, foundations, fuel handling and civil engineering. Often capacity of boiler given expressed as lb/hour of steam raised i.e. that which a boiler can evaporate at full load output. Large boilers are designated in tonnes/hour e.g. 600 000 lb/hour 2 tonnes per hour The temperature at which the boiler operates should be noted e.g. 3500C and the pressure at which the steam is generated (e.g. 1500 psig) A small boiler will evaporate 2,000 lb/hour. A large industrial boiler 100,000 lb/hour If a boiler is rated in Btu/hr (it is usually for hot water) it can be converted in lb/hours taking: 1000 Btu/hr = 1lb/hour 3412 Btu/hr = 1KW/hour Often maximum ratings lb/hour are stated on the machine but this is NOT the normal working rating but the maximum allowing for safety margins. Calculate values on the working rate only but have a note of the maximum rate especially if it is substantially greater that the present operating rate. lb/sq inch This is the working pressure of the boiler and under 250lb/sq in is regarded as low pressure and over 300lb/sq in as high pressure. Low Pressure -Heating and process steam High Pressure-Driving (power) and process steam 1 Bar = 14.5 psig (at atmosphere) psig General: Hot water boiler-Rated in btu/hour Steam boilers-Rated in evaporated lbs/hour

Referencing details: Dimensions and working pressure/temperatures

Cost information notes: -

Steam taken under pressure to drive machines direct, and when pressure is let down to heat buildings or to be used in the process. Cost excludes flues, precipitators, foundations, fuel handling and civil engineering. Often capacity of boiler given expressed as 1lb/hour of steam raised i.e. that which a boiler can evaporate at full load output. Large boilers are designated in tonnes/hour e.g. 600 000 lb/hour 2 tonnes per hour The temperature at which the boiler operates should be noted e.g. 3500C and the pressure at which the steam is generated (e.g. 1500 psig) A small boiler will evaporate 2,000 lb/hour A large industrial boiler 100,000 lb/hour If a boiler is rated in Btu/hr (it is usually for hot water) it can be converted in lb/hours taking: 1000 Btu/hr = 1lb/hour 3412 Btu/hr = 1KW/hour

Referencing details: “This particular item will normally be encountered in service as a ‘process’ boiler, providing heat in the form of steam for manufacturing processes.
But it is possible that it may have multiple functions:
If it produces steam to drive a steam turbine it could be rateable within Class 1, as being mainly used for ‘power’. If it produces steam to heat the buildings that make up the hereditament it could be rateable within Class 2, as a service ‘to’ the hereditament. If it is mainly used as a ‘process’ boiler, it could be rateable within Class 4, but only if it passes the Class 4 ‘structure’ tests.”

Cost information notes: -

Rateable element: Boiler (Class 4 Table 4) structural part of Boiler only

Non-rateable element: Process Boiler ss rateable under Class 4 Table 4

Adjusted plant and machinery: Generator, Compressor, Foundations, Pits, Tanks, supports, Settings, Economisers, Super heaters

Description: Steam Boilers usually fired by gas or oil, which are capable of operation at high pressures. Natural gas, Waste gas, Gas oil, refuse or coal products may be utilised as fuel. The boilers usually have super heaters (to allow high pressure and temperatures to be reached) and economisers (to pre heat the feed water). Fired by oil or gas (see new coal dust burning boilers being installed,) to usually heat the water in tubes in a drum. Steam boilers are usually high pressure. Steam taken under pressure to drive machines direct, and when pressure is let down to heat buildings or to be used in the process. Cost excludes flues, precipitators, foundations, fuel handling and civil engineering. Often capacity of boiler given expressed as lb/hour of steam raised i.e. that which a boiler can evaporate at full load output. Large boilers are designated in tonnes/hour e.g. 600 000 lb/hour 2 tonnes per hour The temperature at which the boiler operates should be noted e.g. 3500C and the pressure at which the steam is generated (e.g. 1500 psig) A small boiler will evaporate 2,000 lb/hour A large industrial boiler 100,000 lb/hour If a boiler is rated in Btu/hr (it is usually for hot water) it can be converted in lb/hours taking: 1000 Btu/hr = 1lb/hour 3412 Btu/hr = 1KW/hour

Referencing details: “This particular item will normally be encountered in service as a ‘process’ boiler, providing heat in the form of steam for manufacturing processes.
But it is possible that it may have multiple functions:
If it produces steam to drive a steam turbine it could be rateable within Class 1, as being mainly used for ‘power’. If it produces steam to heat the buildings that make up the hereditament it could be rateable within Class 2, as a service ‘to’ the hereditament. If it is mainly used as a ‘process’ boiler, it could be rateable within Class 4, but only if it passes the Class 4 ‘structure’ tests.”

Cost information notes: -

Rateable element: Boiler (Class 4 Table 4) structural part of Boiler only

Non-rateable element: Process Boiler ss rateable under Class 4 Table 4

Adjusted plant and machinery: Generator, Compressor, Foundations, Pits, Tanks, supports, Settings, Economisers, Super heaters

Number of items adjusted: The item can typically be found on an industrial, commercial or office complex. Some hereditaments may have multiple items, in which case the ERC needs to reflect the number of items.

Contract size adjustment: See Appendix BEAMS Note 1

Unit size: Each Plant/system

Unit of measurement: Each

ERC: £10,179,452

Superseded codes: -

Location factor: Considered Not Applicable at time of Publication

Description: Steam Boilers usually fired by gas or oil, which are capable of operation at high pressures. Natural gas, Waste gas, Gas oil, refuse or coal products may be utilised as fuel. The boilers usually have super heaters (to allow high pressure and temperatures to be reached) and economisers (to pre heat the feed water). Fired by oil or gas (see new coal dust burning boilers being installed,) to usually heat the water in tubes in a drum. Steam boilers are usually high pressure. Steam taken under pressure to drive machines direct, and when pressure is let down to heat buildings or to be used in the process. Cost excludes flues, precipitators, foundations, fuel handling and civil engineering. Often capacity of boiler given expressed as lb/hour of steam raised i.e. that which a boiler can evaporate at full load output. Large boilers are designated in tonnes/hour e.g. 600 000 lb/hour 2 tonnes per hour The temperature at which the boiler operates should be noted e.g. 3500C and the pressure at which the steam is generated (e.g. 1500 psig) A small boiler will evaporate 2,000 lb/hour A large industrial boiler 100,000 lb/hour If a boiler is rated in Btu/hr (it is usually for hot water) it can be converted in lb/hours taking: 1000 Btu/hr = 1lb/hour 3412 Btu/hr = 1KW/hour

Referencing details: “This particular item will normally be encountered in service as a ‘process’ boiler, providing heat in the form of steam for manufacturing processes.
But it is possible that it may have multiple functions:
If it produces steam to drive a steam turbine it could be rateable within Class 1, as being mainly used for ‘power’. If it produces steam to heat the buildings that make up the hereditament it could be rateable within Class 2, as a service ‘to’ the hereditament. If it is mainly used as a ‘process’ boiler, it could be rateable within Class 4, but only if it passes the Class 4 ‘structure’ tests.”

Cost information notes: -

Often capacity of boiler given expressed as lb/hour of steam raised i.e. that which a boiler can evaporate at full load output. Large boilers are designated in tonnes/hour e.g. 600 000 lb/hour 2 tonnes per hour The temperature at which the boiler operates should be noted e.g. 3500C and the pressure at which the steam is generated (e.g. 1500 psig) A small boiler will evaporate 2,000 lb/hour A large industrial boiler 100,000 lb/hour If a boiler is rated in Btu/hr (it is usually for hot water) it can be converted in lb/hours taking: 1000 Btu/hr = 1lb/hour 3412 Btu/hr = 1KW/hour

Referencing details: “This particular item will normally be encountered in service as a ‘process’ boiler, providing heat in the form of steam for manufacturing processes.
But it is possible that it may have multiple functions:
If it produces steam to drive a steam turbine it could be rateable within Class 1, as being mainly used for ‘power’. If it produces steam to heat the buildings that make up the hereditament it could be rateable within Class 2, as a service ‘to’ the hereditament. If it is mainly used as a ‘process’ boiler, it could be rateable within Class 4, but only if it passes the Class 4 ‘structure’ tests.”

Cost information notes: -

Rateable element: Boiler (Class 4 Table 4) structural part of Boiler only

Description: Steam Boilers usually fired by gas or oil, which are capable of operation at high pressures. Natural gas, Waste gas, Gas oil, refuse or coal products may be utilised as fuel. The boilers usually have super heaters (to allow high pressure and temperatures to be reached) and economisers (to pre heat the feed water). Fired by oil or gas (see new coal dust burning boilers being installed,) to usually heat the water in tubes in a drum. Steam boilers are usually high pressure. Steam taken under pressure to drive machines direct, and when pressure is let down to heat buildings or to be used in the process. Cost excludes flues, precipitators, foundations, fuel handling and civil engineering. Often capacity of boiler given expressed as lb/hour of steam raised i.e. that which a boiler can evaporate at full load output. Large boilers are designated in tonnes/hour e.g. 600 000 lb/hour 2 tonnes per hour The temperature at which the boiler operates should be noted e.g. 3500C and the pressure at which the steam is generated (e.g. 1500 psig) A small boiler will evaporate 2,000 lb/hour A large industrial boiler 100,000 lb/hour If a boiler is rated in Btu/hr (it is usually for hot water) it can be converted in lb/hours taking: 1000 Btu/hr = 1lb/hour 3412 Btu/hr = 1KW/hour

Location factor: Considered Not Applicable at time of Publication

Description: Shell Boilers: - Shell boilers are filled with water (top) and have a combustion chamber (lower). The heat passes through the water and makes it hot. In some cases the heat turns the water to steam. General information: - These boilers are used for hot water purposes and low-pressure steam and are also used for heating the property, providing hot water for kitchens, showers and toilets et cetera. [In rental valuations the cost of the heating boiler will be reflected in the rate adopted for the floor area, which will include an element for heating. In such circumstances DO NOT add separately for the heating boiler]. Hot water from these boilers may be used in the process of the occupier, e.g. cooking vegetables in a canning factory. Steam can be used for heating purposes and as part of the process. Boilers are made from mild steel and are circular however some are contained within a square acoustic / insulated "box". Usually gas fired these boilers can be gas oil fired and in very unusual circumstances coke or alternative fuels can be employed. Costs include instrumentation. Costs do not include concrete foundations of settings. Water Tube: Tubes containing water pass through a main firebox and the water heats up. Usually these boilers are for steam production the steam being used for heating purposes on the hereditament and in the process being undertaken on the premises. The smaller tube steam boilers are unlikely to be used for power generation.

Description: Shell Boilers: - Shell boilers are filled with water (top) and have a combustion chamber (lower). The heat passes through the water and makes it hot. In some cases the heat turns the water to steam. General information: - These boilers are used for hot water purposes and low-pressure steam and are also used for heating the property, providing hot water for kitchens, showers and toilets et cetera. [In rental valuations the cost of the heating boiler will be reflected in the rate adopted for the floor area, which will include an element for heating. In such circumstances DO NOT add separately for the heating boiler]. Hot water from these boilers may be used in the process of the occupier, e.g. cooking vegetables in a canning factory. Steam can be used for heating purposes and as part of the process. Boilers are made from mild steel and are circular however some are contained within a square acoustic / insulated "box". Usually gas fired these boilers can be gas oil fired and in very unusual circumstances coke or alternative fuels can be employed. Costs include instrumentation. Costs do not include concrete foundations of settings. Water Tube: Tubes containing water pass through a main firebox and the water heats up. Usually these boilers are for steam production the steam being used for heating purposes on the hereditament and in the process being undertaken on the premises. The smaller tube steam boilers are unlikely to be used for power generation.

Referencing details: Class 1 Table 1 Plant and Machinery specified in Table 1 below which is USED or INTENDED to be USED MAINLY OR EXCLUSIVELY in connection with\¬85 "Mainly" This does not mean the % must be more than 50% i.e.: Power (Class 1) 45%Heating (Class 2) 35%Process (Class 4) 20% Mainly Class 1 All the boiler is Rateable Or Power (Class 1) 20%Heating (Class 2) 55%Process (Class 4) 25%Class 2 (in part) All the boiler is Rateable Or Power (Class 1) 30%Heating (Class 2) 30%Process (Class 4) 40%Class 4 Not Rateable Class 1 or 2 (If any part is in Class 2 the whole is rateable under this class) But may be rateable under Class 4"Mainly" Do not add together the % for Class 1 and Class 2 in order to be greater than Class 4The words mainly have been omitted from Class 2 (SI 2000 540) and thus any boiler, which is in part rateable under Class 2, is a Class

2 boiler. (Some discretion may be required if only a small part of the boilers output is used for Class 2 purposes. Description: Variety of boilers similar in shape and design to domestic gas hot water boilers, used to raise hot water (but sometimes steam). Single heater by-pass system used for heating Factories, Sports Centres, Universities, Colleges etc. Maximum work pressure not greater than 7 bars. Main source of heat is gas, gas oil or oil. Steam or Hot water is used for heating or process or a combination of both. For greater output units may be linked together but for larger amounts of constant heat a small package boiler is more suitable. Heat recovery from the exhaust gases utilised for ducted warm air or further warm water. Boilers are constructed of mild steel and include safety valves, water gauges and computer controls. Can work in groups of 4, 5, and 6 up to a range of 16 in order to give the required kW output. Often maximum ratings lb/hour are stated on the machine but this is NOT the normal working rating but the maximum allowing for safety margins.

Referencing details: Boilers will be rateable where Steam is used for Power (Class 1 Table 1) Services i.e. Heat (Class 2 Table 2) or it is a Named Structure (when used for the Process)(Class 4 Table 4) A small boiler will evaporate 2,000 lb/hour A large industrial boiler 100,000 lb/hour If a boiler is rated in Btu/hr (it is usually for hot water) it can be converted in lb/hours taking 1000 Btu/hr = 1lb/hour 3412 Btu/hr = 1KW/hour Most modern boilers are rated in kW / hr.

Cost information notes: -

Rateable element: Boiler (Class 1 Table 1 including list of accessories)

Non-rateable element: i) Process Boiler ss rateable under Class 4 Table 4 ii)Dual-purpose boiler not used ¬mainly or exclusively¬ for either Class 1 Table 1 purpose

Single heater by-pass system used for heating Factories, Sports Centres, Universities, Colleges etc. Maximum work pressure not greater than 7 bars. Main source of heat is gas, gas oil or oil. Steam or Hot water is used for heating or process or a combination of both. For greater output units may be linked together but for larger amounts of constant heat a small package boiler is more suitable. Heat recovery from the exhaust gases utilised for ducted warm air or further warm water. Boilers are constructed of mild steel and include safety valves, water gauges and computer controls. Can work in groups of 4, 5, and 6 up to a range of 16 in order to give the required kW output. Often maximum ratings lb/hour are stated on the machine but this is NOT the normal working rating but the maximum allowing for safety margins.

Referencing details: Boilers will be rateable where Steam is used for Power (Class 1 Table 1) Services i.e. Heat (Class 2 Table 2) or it is a Named Structure (when used for the Process)(Class 4 Table 4) A small boiler will evaporate 2,000 lb/hour A large industrial boiler 100,000 lb/hour If a boiler is rated in Btu/hr (it is usually for hot water) it can be converted in lb/hours taking 1000 Btu/hr = 1lb/hour 3412 Btu/hr = 1KW/hour Most modern boilers are rated in kW / hr.

Cost information notes: -

Rateable element: Boiler (Class 1 Table 1 including list of accessories)

Non-rateable element: i) Process Boiler ss rateable under Class 4 Table 4 ii)Dual-purpose boiler not used ¬mainly or exclusively¬ for either Class 1 Table 1 purpose

Adjusted plant and machinery: Generator, Compressor, Foundations, Pits, Tanks, supports, Settings, Economisers, Super heaters.

Number of items adjusted: The item can typically be found on an industrial, commercial or office complex. Some hereditaments may have multiple items, in which case the ERC needs to reflect the number of items.

Contract size adjustment: See Appendix BEAMS Note 1

Variations: -

Unit size: one

Unit of measurement: Each

ERC: £16,020

Superseded codes: -

Location factor: Considered Not Applicable at time of Publication

Description: Large usually circular package type boiler often located in its own boiler house. Where supplies are available the boiler is gas fired, failing this gas oil is adopted. The hot exhaust gases are often used through a heat exchanger in order to efficiently use the heat available to bring the water to the required temperature. The hot water boilers should be considered under Class 4 Table 4. [they are subject to Class 4 (a) to (d)] However if part of the boiler is used to heat the hereditament then under the pre amble to Class 2 the whole of the boiler is rateable.

Referencing details: Size of the boiler (physical) The boiler output (usually kW) The use of the hot water

Cost information notes: The Costs are for a Class 2 Boiler. For Class 4 Boilers take 60 % of the Class 2 costs

Rateable element: Boiler (Class 4 Table 4) structural part of Boiler only

Non-rateable element: Process Boiler ss rateable under Class 4 Table 4

Adjusted plant and machinery: Generator, Compressor, Foundations, Pits, Tanks, supports, Settings, Economisers, Super heaters

Description: Variety of boilers similar in shape and design to domestic gas hot water boilers, used to raise hot water (but sometimes steam). Single heater by-pass system used for heating Factories, Sports Centres, Universities, Colleges etc. Maximum work pressure not greater than 7 bars. Main source of heat is gas, gas oil or oil. Steam or Hot water is used for heating or process or a combination of both. For greater output units may be linked together but for larger amounts of constant heat a small package boiler is more suitable. Heat recovery from the exhaust gases utilised for ducted warm air or further warm water. Boilers are constructed of mild steel and include safety valves, water gauges and computer controls. Can work in groups of 4, 5, and 6 up to a range of 16 in order to give the required kW output. Often maximum ratings lb/hour are stated on the machine but this is NOT the normal working rating but the maximum allowing for safety margins.

Referencing details: output in kW

Cost information notes: -

Rateable element: Boiler (Class 1 Table 1 or Class 2 Table 2 including list of accessories)

Non-rateable element: i) Process Boiler ss rateable under Class 4 Table ii) Dual-purpose boiler not used ¬mainly or exclusively¬ for either Class iii) 1 Table 1 purposes ss rateable under Class 4 Table 4. Accessories to Class 4 boilers. Certain conditions under Class 2

Adjusted plant and machinery: Generator, Compressor, Foundations, Pits, Tanks, supports, Settings, Economisers, Super heaters.

Number of items adjusted: The item can typically be found on an industrial, commercial or office complex. Some hereditaments may have multiple items, in which case the ERC needs to reflect the number of items.

Contract size adjustment: See Appendix BEAMS Note 1

Boreholes

CG Code: 203A01

Specific: Water

Descriptive: Steel pipe

Tech 1: 150mm (6")

Tech 2: -

Unit size: Linear Metre

Unit of measurement: m

ERC: £215

Superseded codes: -

Location factor: Location Adjustment Applicable (See Guidance Notes) - ERC = UK mean of 1.00

Description: The rate detailed above is based on drilling the borehole to 100m depth. The rate is an all-in rate and does not include for mobilisation , transportation of the drilling rig, set up drilling, (See Code 203A01A). or for any pumping equipment

Referencing details: Record the diameter of bore hole and depth in metres

Cost information notes: The costs are based on medium hard subsoil. Any extreme condition will increase the cost.

Rateable element: Class 4, Table 3. Well casings and liners. Note: value of land may in addition be increased due to having potable water available. The well casing is EXTRA

Non-rateable element: Unlined hole (i.e. not plant and machinery but note that value of the land may be enhanced by the presence of the hole).

Adjusted plant and machinery: Pumps, generators, tanks and reservoirs

Number of items adjusted: The item can typically be found on an industrial, commercial or office complex. Some hereditaments may have multiple items, in which case the ERC needs to reflect the number of items.

Contract size adjustment: See Appendix BEAMS Note 2

Variations: If boreholes are in made ground/landfill or hard rock e.g. granite or sandstone then the above costs should be increased by 50%.

Non-rateable element: Unlined hole (i.e. not plant and machinery but note that value of the land may be enhanced by the presence of the hole).

Adjusted plant and machinery: Pumps, generators, tanks and reservoirs

Number of items adjusted: The item can typically be found on an industrial, commercial or office complex. Some hereditaments may have multiple items, in which case the ERC needs to reflect the number of items.

Contract size adjustment: See Appendix BEAMS Note 2

Variations: If boreholes are in made ground/landfill or hard rock e.g. granite or sandstone then the above costs should be increased by 50%.

Boreholes

CG Code: 203A05A

Specific: Water

Descriptive: Fixed price for setting up drill

Tech 1: 600mm (24")

Tech 2: Concrete pipe

Unit size: Each

Unit of measurement: Each

ERC: £8,080

Superseded codes: -

Location factor: Location Adjustment Applicable (See Guidance Notes) - ERC = UK mean of 1.00

Description: Fixed price for setting up drilling rig. include costs relating to mobilisation of the drilling rig, labour, borehole ancillary equipment and support vehicles, Note costs for setting up rig can vary considerably. The rate detailed above is based on drilling the borehole to 100m depth.

Referencing details: -

Cost information notes: -

Bowling alleys

CG Code: STS003

Specific: Modern ten-pin bowling alleys

Descriptive: Modern purpose built ten-pin bowling alleys located in an out-of-town leisure park with complementary leisure uses; usually housed in steel portal frame structure with profiled metal sheet cladding.

Tech 1: Purpose Built

Tech 2: Ten Lane

Unit size: 10 Lane

Unit of measurement: m²

ERC: £0

Superseded codes:

Location factor: Location Adjustment Applicable (See Guidance Notes) - ERC = UK mean of 1.00

Description: Modern purpose built ten-pin bowling alley located in an out-of-town leisure park with complementary leisure uses; usually housed in steel portal frame structures with profiled metal sheet cladding. Generally provided with ten lanes for ten-pin bowling with screens and oiled timber floors, reception counter, shoe storage, spectator seating, air hockey tables, arcade games, dining seating, bar and kitchen.

Referencing details: Measure To GIA - Refer to Rating Manual Section 130:Bowling Alleys Paragraph “6.0 Survey Requirements”.

Cost information notes: The recommended valuation approach is to adopt an overall price per square metre GIA which reflects the location and physical characteristics of the property. In such cases, rents, on a shell basis, should be analysed at a price/m2 GIA. Details of fit-out costs will also be required for analysis to provide an appropriate addition to reflect fit-out.

Rateable element: Refer to Rating Manual Section 130:Bowling Alleys and Practice Note 1:2020 - Bowling Alleys - The walls, ceilings, flooring, bowling lanes and services are rateable.

Non-rateable element: Refer to Rating Manual Section 130:Bowling Alleys and Practice Note 1:2020 - Bowling Alleys - The bowling machinery, video and electrical wiring for the machinery and loose equipment are not rateable.

Adjusted plant and machinery: Referencer to ascertain during on-site inspection in accordance with the Rating Manual Section 130:Bowling Alleys and Practice Note 1:2020 - Bowling Alleys

HM Revenue & Customs | Valuation Office

Number of items adjusted: Referencer to ascertain during on-site inspection in accordance with the Rating Manual Section 130:Bowling Alleys and Practice Note 1:2020 - Bowling Alleys

Description: A square or rectangular hopper bottomed structure of sheet steel plate of varying thickness, including support steelwork Holding Volume 300m3 Plate Thickness 6 mm to 12mm

Referencing details: Holding volume of hopper and external works

Cost information notes: Based on holding volume of hopper. Use cost for total volume of all hoppers in one structure. Costs include supporting steelwork but exclude foundations. The plant and machinery listed in the description has been included in this costing.

Rateable element: -

Non-rateable element: -

Adjusted plant and machinery: Conveyors, settings, housings and external works

Number of items adjusted: -

Contract size adjustment: See Appendix BEAMS Note 2

Variations: Add foundation costs - see either isolated bases or floor slab cost

Bunkers

CG Code: 43510S

Specific: Concrete Hopper

Descriptive: Steel plate square or rectangular

Tech 1: 6mm

Tech 2: 400m3

Unit size: -

Unit of measurement: m3

ERC: £540

Superseded codes: -

Location factor: Location Adjustment Applicable (See Guidance Notes) - ERC = UK mean of 1.00

Description: A square or rectangular hopper bottomed structure of sheet steel plate of varying thickness, including support steelwork Holding Volume 400m3 Plate Thickness 6 mm to 12mm

Referencing details: Holding volume of hopper and external works

Cost information notes: Based on holding volume of hopper. Use cost for total volume of all hoppers in one structure. Costs include supporting steelwork but exclude foundations. The plant and machinery listed in the description has been included in this costing.

Rateable element: -

Non-rateable element: -

Adjusted plant and machinery: Conveyors, settings, housings and external works

Number of items adjusted: -

Contract size adjustment: See Appendix BEAMS Note 2

Variations: Add foundation costs - see either isolated bases or floor slab cost

Bunkers

CG Code: 43510T

Specific: Concrete Hopper

Descriptive: Steel plate square or rectangular

Tech 1: 6mm

Tech 2: 500m3

Unit size: -

Unit of measurement: m3

ERC: £540

Superseded codes: -

Location factor: Location Adjustment Applicable (See Guidance Notes) - ERC = UK mean of 1.00

Description: A square or rectangular hopper bottomed structure of sheet steel plate of varying thickness, including support steelwork Holding Volume 500m3 Plate Thickness 6 mm to 12mm

Referencing details: Holding volume of hopper and external works

Cost information notes: Based on holding volume of hopper. Use cost for total volume of all hoppers in one structure. Costs include supporting steelwork but exclude foundations. The plant and machinery listed in the description has been included in this costing.

Rateable element: -

Non-rateable element: -

Adjusted plant and machinery: Conveyors, settings, housings and external works

Number of items adjusted: -

Contract size adjustment: See Appendix BEAMS Note 2

Variations: Add foundation costs - see either isolated bases or floor slab cost

Bunkers

CG Code: 43512A

Specific: Concrete Hopper

Descriptive: Steel plate square or rectangular

Tech 1: 7mm

Tech 2: 50m3

Unit size: -

Unit of measurement: m3

ERC: £896

Superseded codes: -

Location factor: Location Adjustment Applicable (See Guidance Notes) - ERC = UK mean of 1.00

Description: A square or rectangular hopper bottomed structure of sheet steel plate of varying thickness, including support steelwork Holding Volume 50m3 Plate Thickness 6 mm to 12mm

Referencing details: Holding volume of hopper and external works

Cost information notes: Based on holding volume of hopper. Use cost for total volume of all hoppers in one structure. Costs include supporting steelwork but exclude foundations. The plant and machinery listed in the description has been included in this costing.

Rateable element: -

Non-rateable element: -

Adjusted plant and machinery: Conveyors, settings, housings and external works

Number of items adjusted: -

Contract size adjustment: See Appendix BEAMS Note 2

Variations: Add foundation costs - see either isolated bases or floor slab cost

Bunkers

CG Code: 43512C

Description: A square or rectangular hopper bottomed structure of sheet steel plate of varying thickness, including support steelwork Holding Volume 500m3 Plate Thickness 6 mm to 12mm

Referencing details: Holding volume of hopper and external works

Cost information notes: Based on holding volume of hopper. Use cost for total volume of all hoppers in one structure. Costs include supporting steelwork but exclude foundations. The plant and machinery listed in the description has been included in this costing.

Rateable element: -

Non-rateable element: -

Adjusted plant and machinery: Conveyors, settings, housings and external works

Number of items adjusted: -

Contract size adjustment: See Appendix BEAMS Note 2

Variations: Add foundation costs - see either isolated bases or floor slab cost

Bunkers

CG Code: 43518A

Specific: Hopper Bottomed

Tech 2: Simple

Unit size: -

Unit of measurement: m2

ERC: £210

Superseded codes: -

Location factor: Location Adjustment Applicable (See Guidance Notes) - ERC = UK mean of 1.00

Description: Canopies are extensions or attachments to an existing building for the purpose of providing shelter whilst loads are unloaded. This cost relates to a canopy cantilevered from one side of the building with no additional support columns. Usually the canopy will contain a profiled metal deck system with associated rainwater goods. Due to the lack of additional supporting columns side panels are not fitted.

Referencing details: Measured as GIA

Cost information notes: Cost based on a 5m wide structure cantilevered with a 0.7mm aluminium roofing, commercial grade. Uninsulated fabric. Lighting not included. When determining the costs to apply to canopies one should consider the individual property overall and appraise whether or not any form of quantum is appropriate.

Description: Canopies are extensions or attachments to an existing building for the purpose of providing shelter whilst loads are unloaded. This cost relates to a canopy supported by the building it serves and additional columns. Usually the canopy will contain a profiled metal deck system with associated rainwater goods. It may be partially enclosed on 1 side or more.

Referencing details: Measured as GIA. Measure area of side wall.

Cost information notes: Cost based on a 5m wide structure cantilevered with a 0.7mm aluminium roofing, commercial grade. Uninsulated fabric. Lighting not included. When determining the costs to apply to canopies one should consider the individual property overall and appraise whether or not any form of quantum is appropriate.

Canopies

CG Code: 30C013

Specific: Supported

Descriptive: Industrial

Tech 1: 5.0m - 10.0m span

Tech 2: -

Unit size: -

Unit of measurement: m2

ERC: £181

Superseded codes: -

Location factor: Location Adjustment Applicable (See Guidance Notes) - ERC = UK mean of 1.00

Description: Canopies are extensions or attachments to an existing building for the purpose of providing shelter whilst loads are unloaded. This cost relates to a canopy supported by the building it serves and additional columns. Usually the canopy will contain a profiled metal deck system with associated rainwater goods. It may be partially enclosed on 1 side or more.

Referencing details: Measured as GIA. Measure area of side wall.

Cost information notes: Rate based on a 10m wide structure with supporting columns under a 0.7mm uninsulated commercial grade aluminium roof cladding . Lighting included. Base rate reflects cladding 1m down from eaves - additional cladding including partially enclosed sides should be added as an addition to the base cost. When determining the costs to apply to canopies one should consider the individual property overall and appraise whether or not any form of quantum is appropriate.

Car wash

CG Code: 60X00A

Specific: Stand-alone type

Descriptive: A steel framed building c.120m2 with a profiled metal flat roof or pitched roof covered with artificial slate or tile.

Tech 1: -

Tech 2: -

Unit size: -

Unit of measurement: m2

ERC: £327,069

Superseded codes: -

Location factor: Location Adjustment Applicable (See Guidance Notes) - ERC = UK mean of 1.00

Description: A stand-alone car wash. They are usually positioned on a flat level site with good access from a busy main road. The site area is normally one-third to half an acre with good bitumen macadam surfacing and car parking for 5 or 6 cars. The car wash equipment is housed in a steel framed building around 120m2 in area with a profiled metal flat roof or pitched roof covered with artificial slate or tile. Under the floor of the building there are concrete re-circulation chambers where grit is allowed to settle out of used water. The walls to the building are usually tiled internally with ceramic tiles. Eaves height is around 3.6m

Descriptive: Circular on Plan

Tech 1: Height above GL

Tech 2: 20 metres

Unit size: m height

Unit of measurement: m

ERC: £3,751

Superseded codes: -

Location factor: Location Adjustment Applicable (See Guidance Notes) - ERC = UK mean of 1.00

Description: Brick built flue stacks are no longer constructed but may still be present and active on some industrial sites. Usually constructed from class B engineering brickwork built circular on plan with 50mm fireclay lining to internal face bonded to the chimney stack.

Referencing details: Ascertain base diameter and height. Identify presence of aviation warning lights, lightning conductors, obtain photograph of chimney stack and overall view of base. Note any adjacent and associated plant & machinery such as flues, ducts etc. Check if chimney stack listed or within the curtilage of a listed building.

Cost information notes: Cost is per metre above ground level. Cost does not include foundation bases, Aviation Warning Lights, access ladders or platforms.
Please refer to separate RCG Category for Foundation Bases Code 30001F >500cu.m. or 300045 50cu.m. - 250cu.m. For Aviation lights see Chimney Accessory RCG code 32F15S1.
For Access ladders see Chimney Accessory RCG codes 32F15S2 30m high or 32F15S3 60m High. For Lightning conductors see Separate RCG Category for Lightning Conductors.

Description: Brick built flue stacks are no longer constructed but may still be present and active on some industrial sites. Usually constructed from class B engineering brickwork built circular on plan with 50mm fireclay lining to internal face bonded to the chimney stack.

Referencing details: Ascertain base diameter and height. Identify presence of aviation warning lights, lightning conductors, obtain photograph of chimney stack and overall view of base. Note any adjacent and associated plant & machinery such as flues, ducts etc. Check if chimney stack listed or within the curtilage of a listed building.

Cost information notes: Cost is per metre above ground level. Cost does not include foundation bases, Aviation Warning Lights, access ladders or platforms.
Please refer to separate RCG Category for Foundation Bases Code 30001F >500cu.m. or 300045 50cu.m. - 250cu.m. For Aviation lights see Chimney Accessory RCG code 32F15S1.
For Access ladders see Chimney Accessory RCG codes 32F15S2 30m high or 32F15S3 60m High. For Lightning conductors see Separate RCG Category for Lightning Conductors.

Rateable element: Refer to Rating Manual Section 5 Valuation Practice Part 3: Valuation of Plant and Machinery

Location factor: Location Adjustment Applicable (See Guidance Notes) - ERC = UK mean of 1.00

Description: Single flue reinforced concrete stack usually lined with a 110mm refractory or engineering brick lining. Predominantly used for boilers/plant burning fossil fuels and fuels with a high sulphur content. Single flue reinforced concrete stacks began to replace the traditional solid brick stack from approximately the 1940s.

Referencing details: Ascertain base diameter and height. Identify presence of aviation warning lights, lightning conductors, obtain photograph of chimney stack and overall view of base. Note any adjacent and associated plant & machinery such as flues, ducts etc. Check if chimney stack listed or within the curtilage of a listed building.

Unit size: Each

Unit of measurement: Each

ERC: £57,116

Superseded codes: -

Location factor: Location Adjustment Applicable (See Guidance Notes) - ERC = UK mean of 1.00

Description: To ensure aviation safety and in accordance with relevant Air Navigation Orders the person in charge of an en-route obstacle must ensure that it is fitted with medium intensity steady red lights positioned as close as possible to the top of the obstacle and at intermediate levels spaced so far as practicable equally between the top lights and ground level with an interval of not more than 52 metres. Low intensity lights are required for structures below 45 metres in height, medium/high intensity lights (location dependent) are required for structures above 45 metres in height. Cost can differ significantly due to site influences and location.

Referencing details: Identify presence and number of aviation warning lights.

Cost information notes: Cost is for the complete installation of Aviation Warning Lights based on a structure exceeding 45 metres in height.

CG Code: 32F15Z

Specific: Steel

Descriptive: Lined self-supporting flue stack

Tech 1: 2600mm diameter at base

Tech 2: Height Up to 100m

Unit size: <100m

Unit of measurement: m

ERC: £5,406

Superseded codes: -

Location factor: Location Adjustment Applicable (See Guidance Notes) - ERC = UK mean of 1.00

Description: Single steel self-supporting flue stack lined internally. Thickness of steel plate assumed to be 12.00mm for flue stacks up to 100m above ground level. Circular in cross-section usually tapering towards the top of the stack. Lined to provide heat and corrosion protection to the steel structure. Presence of lining dependent upon the temperatures of the flue and chemical composition of the flue gases.

Referencing details: Ascertain base diameter and height. Identify presence of aviation warning lights, lightning conductors, obtain photograph of chimney stack and overall view of base. Note any adjacent and associated plant & machinery such as flues, ducts etc. Check if chimney stack listed or within the curtilage of a listed building.

Cost information notes: Cost is per metre above ground level up to a maximum height of 100m. Cost does not include foundation bases, Aviation Warning Lights, access ladders or platforms. Please refer to separate RCG Category for Foundation Bases Code 30001F >500cu.m. or 300045 50cu.m. - 250cu.m.
For Aviation lights see Chimney Accessory RCG code 32F15S1.
For Access ladders see Chimney Accessory RCG codes 32F15S2 30m high or 32F15S3 60m High. For Lightning conductors see Separate RCG Category for Lightning Conductors.

Location factor: Location Adjustment Applicable (See Guidance Notes) - ERC = UK mean of 1.00

Description: Mild steel flue liners used in conjunction with reinforced concrete windshields usually forming multi-flue stacks. Generally the air space around the flues is ventilated. Consists of steel base plates bolted down into reinforced concrete foundation slab, sheet steel rolled plates welded at seams, flanges at section joints approx. 6.00 to 10.00m long according to access in windshield, cranage and transport available suitable for the height. The usual thickness of steel plate flues under 50m long is 6.00mm, from 50 to 100m is 8.00mm, for 100 to 150m is 10.00mm and above this height 12.00mm (Note: thickest section at base).

Referencing details: Ascertain base diameter and height. Identify presence of aviation warning lights, lightning conductors, obtain photograph of chimney stack and overall view of base. Note any adjacent and associated plant & machinery such as flues, ducts etc. Check if chimney stack listed or within the curtilage of a listed building.

Cost information notes: Cost is per metre above ground level. Cost does not include foundation bases, Aviation Warning Lights, access ladders or platforms. Please refer to separate RCG Category For Foundation Bases Code 30001F >500cu.m. or 300045 50cu.m. - 250cu.m. For Aviation lights see Chimney Accessory RCG code 32F15S1. For Access ladders see Chimney Accessory RCG codes 32F15S2 30m high or 32F15S3 60m High. For Lightning conductors see Separate RCG Category for Lightning Conductors.

Tech 1: 8mm plate

Tech 2: Flue Diameter - 3.25m

Unit size: m height

Unit of measurement: m

ERC: £4,942

Superseded codes: -

Location factor: Location Adjustment Applicable (See Guidance Notes) - ERC = UK mean of 1.00

Description: Mild steel flue liners used in conjunction with reinforced concrete windshields usually forming multi-flue stacks. Generally the air space around the flues is ventilated. Consists of steel base plates bolted down into reinforced concrete foundation slab, sheet steel rolled plates welded at seams, flanges at section joints approx. 6.00 to 10.00m long according to access in windshield, cranage and transport available suitable for the height. The usual thickness of steel plate flues under 50m long is 6.00mm, from 50 to 100m is 8.00mm, for 100 to 150m is 10.00mm and above this height 12.00mm (Note: thickest section at base).

Referencing details: Ascertain base diameter and height. Identify presence of aviation warning lights, lightning conductors, obtain photograph of chimney stack and overall view of base. Note any adjacent and associated plant & machinery such as flues, ducts etc. Check if chimney stack listed or within the curtilage of a listed building.

Cost information notes: Cost is per metre above ground level. Cost does not include foundation bases, Aviation Warning Lights, access ladders or platforms. Please refer to separate RCG Category for Foundation Bases Code 30001F >500cu.m. or 300045 50cu.m. - 250cu.m. For Aviation lights see Chimney Accessory RCG code 32F15S1. Description: Mild steel flue liners used in conjunction with reinforced concrete windshields usually forming multi-flue stacks. Generally the air space around the flues is ventilated. Consists of steel base plates bolted down into reinforced concrete foundation slab, sheet steel rolled plates welded at seams, flanges at section joints approx. 6.00 to 10.00m long according to access in windshield, cranage and transport available suitable for the height. The usual thickness of steel plate flues under 50m long is 6.00mm, from 50 to 100m is 8.00mm, for 100 to 150m is 10.00mm and above this height 12.00mm (Note: thickest section at base).

Referencing details: Ascertain base diameter and height. Identify presence of aviation warning lights, lightning conductors, obtain photograph of chimney stack and overall view of base. Note any adjacent and associated plant & machinery such as flues, ducts etc. Check if chimney stack listed or within the curtilage of a listed building.

Cost information notes: Cost is per metre above ground level. Cost does not include foundation bases, Aviation Warning Lights, access ladders or platforms. Please refer to separate RCG Category for Foundation Bases Code 30001F >500cu.m. or 300045 50cu.m. - 250cu.m. For Aviation lights see Chimney Accessory RCG code 32F15S1. For Access ladders see Chimney Accessory RCG codes 32F15S2 30m high or 32F15S3 60m High. For Lightning conductors see Separate RCG Category for Lightning Conductors.

Location factor: Location Adjustment Applicable (See Guidance Notes) - ERC = UK mean of 1.00

Description: Self-supporting steel flue stacks. Circular in cross-section, tall and slender tapering towards the top of the stack. Usually lined to provide heat insulation protection to the steel structure, level of insulation dependent upon the temperatures of the flue. See Variations for unlined stacks.

Referencing details: Ascertain base diameter and height. Identify presence of aviation warning lights, lightning conductors, obtain photograph of chimney stack and overall view of base. Note any adjacent and associated plant & machinery such as flues, ducts etc. Check if chimney stack listed or within the curtilage of a listed building.

Cost information notes: Cost is per metre above ground level. Cost does not include foundation bases, Aviation Warning Lights, access ladders or platforms. Please refer to separate RCG Category for Foundation Bases Code 30001F >500cu.m. or 300045 50cu.m. - 250cu.m. For Aviation lights see Chimney Accessory RCG code 32F15S1. For Access ladders see Chimney Accessory RCG codes 32F15S2 30m high or 32F15S3 60m High. For Lightning conductors see Separate RCG Category for Lightning Conductors.

Rateable element: Refer to Rating Manual Section 5 Valuation Practice Part 3: Valuation of Plant and Machinery

Non-rateable element: Refer to Rating Manual Section 5 Valuation Practice Part 3: Valuation of Plant and Machinery

Adjusted plant and machinery: Flues and Ducts

Number of items adjusted: -

Contract size adjustment: See Appendix BEAMS Note 2

Variations: NOTE: Unlined chimney stack approximately 33% less.

Chimneys

CG Code: 32F32A

Specific: Multi-Flue

Descriptive: Windshield - 1.0m diameter

Tech 1: Height above GL - 20m

Tech 2: 300mm diameter flue x 2 no

Unit size: Each

Unit of measurement: Each

ERC: £146,941

Superseded codes: -

Location factor: Location Adjustment Applicable (See Guidance Notes) - ERC = UK mean of 1.00

Description: Cost is for a (SWG) aluminium cladding fitted with a 12mm air space between. The flues are either welded to the base plate or start at the diaphragm plate at a higher level to suit individual connections. The flues are constructed from 6mm mild steel plate rolled and welded, externally and internally coated with heat resistant paint and clad with 50mm thick foil backed mineral fibre wool. The group of individual flues are held in position by stays fixed to the windshield. The cost of the complete chimney, including windshield, flues and foundations is for the total height above ground.

Referencing details: Ascertain base diameter and height. Identify presence of aviation warning lights, lightning conductors, obtain photograph of chimney stack and overall view of base. Note any adjacent and associated plant & machinery such as flues, ducts etc. Check if chimney stack listed or within the curtilage of a listed building.

Cost information notes: Cost is for the above ground installation, Ground works/foundation bases undertaken by specialist civils contractors. Cost does not include foundation bases, Aviation Warning Lights, access ladders and platforms. Please refer to separate RCG Category for Foundation Bases Code 30001F >500cu.m. or 300045 50cu.m. - 250cu.m. For Aviation lights see Chimney Accessory RCG code 32F15S1. Unit of measurement: Each

ERC: £599,138

Superseded codes: -

Location factor: Location Adjustment Applicable (See Guidance Notes) - ERC = UK mean of 1.00

Description: Self-supporting steel flue stacks. Circular in cross-section, tall and slender tapering towards the top of the stack. Usually lined to provide heat insulation protection to the steel structure, level of insulation dependent upon the temperatures of the flue. See Variations for unlined stacks.

Referencing details: Ascertain base diameter and height. Identify presence of aviation warning lights, lightning conductors, obtain photograph of chimney stack and overall view of base. Note any adjacent and associated plant & machinery such as flues, ducts etc. Check if chimney stack listed or within the curtilage of a listed building.

Cost information notes: Cost is per complete multiple flue stack installation above ground level. Cost does not include foundation bases, Aviation Warning Lights, access ladders or platforms. Please refer to separate RCG Category for Foundation Bases Code 30001F >500cu.m. or 300045 50cu.m. - 250cu.m. For Aviation lights see Chimney Accessory RCG code 32F15S1. For Access ladders see Chimney Accessory RCG codes 32F15S2 30m high or 32F15S3 60m High. For Lightning conductors see Separate RCG Category for Lightning Conductors.

Rateable element: Refer to Rating Manual Section 5 Valuation Practice Part 3: Valuation of Plant and Machinery

Non-rateable element: Refer to Rating Manual Section 5 Valuation Practice Part 3: Valuation of Plant and Machinery

Adjusted plant and machinery: Flues and Ducts

Number of items adjusted: -

Contract size adjustment: See Appendix BEAMS Note 2

Variations: NOTE: Unlined chimney stack approximately 33% less.

Description: Self-supporting steel flue stacks. Circular in cross-section, tall and slender tapering towards the top of the stack. Usually lined to provide heat insulation protection to the steel structure, level of insulation dependent upon the temperatures of the flue. See Variations for unlined stacks.

Referencing details: Ascertain base diameter and height. Identify presence of aviation warning lights, lightning conductors, obtain photograph of chimney stack and overall view of base. Note any adjacent and associated plant & machinery such as flues, ducts etc. Check if chimney stack listed or within the curtilage of a listed building.

Cost information notes: Cost is per complete multiple flue stack installation above ground level. Cost does not include foundation bases, Aviation Warning Lights, access ladders or platforms. Please refer to separate RCG Category for Foundation Bases Code 30001F >500cu.m. or 300045 50cu.m. - 250cu.m. For Aviation lights see Chimney Accessory RCG code 32F15S1. For Access ladders see Chimney Accessory RCG codes 32F15S2 30m high or 32F15S3 60m High. For Lightning conductors see Separate RCG Category for Lightning Conductors.

Rateable element: Refer to Rating Manual Section 5 Valuation Practice Part 3: Valuation of Plant and Machinery

Non-rateable element: Refer to Rating Manual Section 5 Valuation Practice Part 3: Valuation of Plant and Machinery

Adjusted plant and machinery: Flues and Ducts

Number of items adjusted: -

Contract size adjustment: See Appendix BEAMS Note 2

Variations: NOTE: Unlined chimney stack approximately 33% less.

Location factor: Location Adjustment Applicable (See Guidance Notes) - ERC = UK mean of 1.00

Description: Basic single storey community style use of building (circa 4m tall, 9m wide x 10m long) - approximately 90m2 GIA. The accommodation comprises a small lobby housing male, female and disabled toilets, a small kitchen / tea point and a hall. Average construction with concrete strip foundations, concrete slab, masonry cavity walls, trussed roof with tiles and load bearing masonry partition. Internal finishes comprise emulsion to plastered walls and plasterboard ceiling, vinyl floor coverings on screed. Painted timber doors & painted MDF skirting, no coving and average quality fittings. Basic service provision with gas central heating.

Referencing details: GIA - Gross internal area.

Location factor: Location Adjustment Applicable (See Guidance Notes) - ERC = UK mean of 1.00

Description: Generally a single storey building housing changing rooms with showers and toilets, social/activity/multipurpose space, public toilet facilities and often basic kitchen, bar or café facilities and possibly a store or a small staff office. Commonly located in public parks, adjacent to public or school sport pitches or at sport clubs. Great variations in design, external finishes and construction between buildings. Steel frame with masonry external walls finished with a range of materials is common. Internally finishes can be very limited to some buildings depending on quality but commonly comprise emulsion or ceramic tiling/uPVC sheeting to plastered walls, combination of painted plasterboard and suspended ceilings and vinyl floor coverings on screed. Cubicles, lockers and benches together with kitchen/bar fittings (if present). Services provision varies particularly when it comes to heating installations (although boiler as a heat source and Low Temperature Hot Water (LTHW) radiators or underfloor heating are common) and in addition to heating generally comprises extensive sanitary, plumbing and ventilation installations to changing and toilet areas, power, lighting, fire and intruder alarms with possible additional security and data installations and sustainable features.

Referencing details: GIA - Gross internal area.

Location factor: Location Adjustment Applicable (See Guidance Notes) - ERC = UK mean of 1.00

Description: Typically a two storey building with boat storage facility on the ground floor and clubhouse, changing facilities, toilets etc to first floor. Sample building has a steel frame with external walls of cladding & curtaining walling, precast concrete first floor and stairs and a mixture of blockwork and stud partitions. Internal finishes comprise emulsion to plastered walls and plasterboard ceilings with vinyl floor coverings on screed. There are painted timber doors & painted MDF skirting, cubicles & Integrated Plumbing System (IPS) panels and possibly a motorised roller shutter to the kitchen. The services comprise sanitary, plumbing, mechanical & electrical installations with some sustainable features. Cost is for a typical "shed" type construction which is used by a club as opposed to a building developed as a commercial enterprise with public access.

Referencing details: GIA - Gross internal area.

Description: Generally a two storey building housing changing rooms with showers and toilets, extensive social/activity/multipurpose/function space, additional toilet facilities, catering kitchen, bar and ancillary storage and office space. Additional facilities may include sports hall, gym, treatment rooms, meeting rooms or retail space for club merchandise. The building is designed to host external functions in addition to the day-to-day sport related uses and has the facilities to provide hot meals. Great variations in design, external finishes and construction between buildings. Steel frame with external walls finished with a range of cladding materials is common. Internally the finishes are of good quality particularly to areas available for hire and commonly comprise emulsion or ceramic tiling/uPVC sheeting to plastered walls, combination of painted plasterboard and suspended ceilings and combination of vinyl, carpet and ceramic tiling floor coverings on screed with specialist timber sports floor to sports hall if present. Cubicles, lockers and benches together with kitchen and bar fittings and display cabinets. Services provision generally comprises heating, extensive sanitary, plumbing and ventilation installations to changing and toilet areas, power, lighting, lift, fire and intruder alarms, data and audio visual (AV) installations with possible air conditioning/cooling, additional security installations and sustainable features.

ERC: £601

Superseded codes: -

Location factor: Location Adjustment Applicable (See Guidance Notes) - ERC = UK mean of 1.00

Description: Adaptation costs only, internally to a standard industrial building to provide a Cold Store (not a freezer). These costs should be added to those for the industrial building. Costs include for extra depth excavation to accommodate the necessary, floor recess to accept the insulated floor including heat mat; secondary support steelwork for walls and ceiling; Proprietary 150mm floor, wall and ceiling panels; personnel/fire escape doors and rapid roll forklift access doors; nominal provision of mechanical installation [NOTE: Chiller Plant and electrical installation is excluded)

Referencing details: Measure external dimensions- deduct wall thickness to provide GIA dimension and record internal height.

Cost information notes: External works are excluded

Rateable element: -

Non-rateable element: -

Adjusted plant and machinery: Chiller plant, motors and compressors

Concrete block works

CG Code: 40CB01

Specific: Concrete block drying chambers

Descriptive: Concrete block curing/drying chamber used solely as a curing chamber or drying kiln for the production of concrete blocks. Usually constructed in situ within an industrial portal framed shed; traditionally constructed using either concrete or brick masonry walls to create the curing/drying chamber.

Tech 1: up to 2.5m high

Tech 2: <3500m3

Unit size: 3500m3

Unit of measurement: m^3

ERC: £456

Superseded codes: -

Location factor: Location Adjustment Applicable (See Guidance Notes) - ERC = UK mean of 1.00

Description: The production of concrete blocks in the UK is usually carried out in modern automated plants. Moulds are filled with concrete and vibro-compacted on pallets. De-moulded blocks are transported onto a pallet by conveyor to the curing/drying chambers. Additional heating may be provided to promote a speedy increase in strength using either heated air or steam. When curing has been completed the blocks are removed from the chamber and stacked for delivery. Curing/drying chambers are a basic structure constructed insitu within an industrial shed; built off the existing concrete ground floor slab with concrete block/brick walls, approx. 2.5m (internal) height. Usually open on two sides with the open ends being enclosed with heavy-duty industrial plastic curtains facilitating access for a fork lift truck or track inset for trolleys stacked with blocks to be pushed in and out through the curtained ends. Curing/drying chambers are similar to Low Temperature Tunnel Dryers found in brickmaking plant (see also codes Furnaces Kilns - Brick 209K01 and Furnaces Dryer Brick 209K02) but should not be confused with specialist bespoke manufactured plant such as Keller and Lingl type chamber dryers.

Referencing details: Measure gross external volume Refer to Rating Manual Section 5a: Valuation of all property classes: Brickworks and clay tileworks

Cost information notes: Cost includes rail track set in the floor of the curing/drying chamber. Unit of measure is cubic metres (m3).

Rateable element: Concrete block curing/drying chambers are rateable if they pass the building or structure tests in accordance with Class 4

Non-rateable element: Measure gross external volume. Refer to Rating Manual Section 5a: Valuation of all property classes: Brickworks and clay tileworks

Adjusted plant and machinery: Ancillary ducting, lighting, alarms, plant and machinery providing heated air or steam.

Number of items adjusted: Identify on-site - However may include other Class 4 items of plant such as:- Rail tracks and transfer ways for kiln cars Weighbridge pits

Contract size adjustment: See Appendix BEAMS Note 2

Variations: For block drying chambers >3500m3 use code 40CBV1

Description: A Conveyor Junction House is found at changes in direction and level of the conveyor system. General construction is typically a cladded steel framed structure sitting on a support steel framework (additional cost). The steel work of the cladded junction house includes universal columns 203mm X 203mm X 46kg/m with horizontal frame bracing of universal beams 203mm x 133mm x 25kg/m. The latter usually provides the rafters for any housing roof. The main structure is usually cross braced with 150mm x 150mm x 15kg/m angle section members.
The junction house is usually clad in either painted, galvanised or plasticoated single skin profiled steel sheeting affixed to rails or purlins. The roof is similarly clad with ridge, flashing and eaves trims. Height of housing structure is typically 4m with a single floor. Floor construction is commonly chequer plate floor on treated timber joists fixed between steel frame members. Stairs or access ladders need to be added as applicable.

Referencing details: Total VOLUME of the cladded junction house covered by roof. Excludes supports , structures and foundations

Cost information notes: Excludes support frame and foundations. Stairs or access ladders need to be added as applicable. Lightning protection to be added as applicable. For additional cost of extra walkways see 215N11 or similar.

Description: A Conveyor Junction House is found at changes in direction and level of the conveyor system. General construction is typically a cladded steel framed structure sitting on a support steel framework (additional cost). The steel work of the cladded junction house includes universal columns 203mm X 203mm X 46kg/m with horizontal frame bracing of universal beams 203mm x 133mm x 25kg/m. The latter usually provides the rafters for any housing roof. The main structure is usually cross braced with 150mm x 150mm x 15kg/m angle section members.
The junction house is usually clad in either painted, galvanised or plasticoated single skin profiled steel sheeting affixed to rails or purlins. The roof is similarly clad with ridge, flashing and eaves trims. Height of housing structure is typically 7.0m with two floors. Floor construction is commonly chequer plate floor on treated timber joists fixed between steel frame members. Stairs or access ladders need to be added as applicable.

Referencing details: Total VOLUME of the cladded junction house covered by roof. Excludes supports , structures and foundations

Cost information notes: Excludes support frame and foundations. Stairs or access ladders need to be added as applicable. Lightning protection to be added as applicable. For additional cost of extra walkways see 215N11 or similar.

Descriptive: Lightweight with cover plate

Tech 1: Belt width 0.61m

Tech 2: Frame width 0.61m

Unit size: -

Unit of measurement: m

ERC: £1,317

Superseded codes: -

Location factor: Location Adjustment Applicable (See Guidance Notes) - ERC = UK mean of 1.00

Description: General construction, 102mm x 51mm x 12.3kg/m Channel section horizontal framework; 60mm x 60mm x 10kg/m cross bracing and cross-rails bracing framework to form 600mm deep box support at 600mm modules; painted finished or galvanised. NOTE: In some cases there may be additional cladding to the sides and/or roof, which is an additional cost. A-frame trestles are costed separately under the applicable Cost Guide section.

Referencing details: In all cases the support width is assumed to be 450mm wider than the belt width. The cover plate is assumed to be 2mm thick and of carbon/mild steel. The cover is added over the steel conveyor support, under the belt, to prevent produce from dropping under the belt.

Cost information notes: Light support is assumed 600mm deep whilst heavy support is assumed 1,000mm deep.

Rateable element: ss the conveyor is being rated under Class1 List of Accessories 1 the belt, drive motor and idler sets are not rateable and thus the steel support structure frame will be rateable under Class 4 Table 3 supports.

Non-rateable element: Belt, motor and idlers (ss rated under List of Accessories 1).

Adjusted plant and machinery: NOTE: For walkways over and at the side of the conveyor, carried from the same framework; see Stairways, Ladders and Walkways. For mesh flooring see Floors, GRP or Weldmesh. For cladding see External Walls - cladding.

Number of items adjusted: The item can typically be found on an industrial or commercial complex. Some hereditaments may have multiple items, in which case the ERC needs to reflect the number of items.

Contract size adjustment: See Appendix BEAMS Note 2

Superseded codes: -

Location factor: Location Adjustment Applicable (See Guidance Notes) - ERC = UK mean of 1.00

Description: The cover plate sits structurally between the supporting structure and the conveyor rollers and belting. Plate will be nominally 2mm thick across width of structure. The specification of light and heavy steel support frame pieces is similar however the light frame is of smaller cross section, lower height with smaller angle legs and thus unable to support the heavier loads imparted. Increased steel work size for heavy frames The cover plate is assumed to be 2mm thick and of carbon/mild steel. This is added over the steel conveyor support under the belt to prevent produce from dropping under the belt. In some cases there may be additional cladding to the sides or roof and this is an additional cost. All steelwork is taken as being galvanised.

Referencing details: Width of conveyor and length in m. Area of plate = m2 Any additional cladding to sides or roof should be noted and added.

Cost information notes: For walkways over and at side of conveyor, carried from same framework see Stairways, Ladders and Walkways. For mesh flooring see Floors, GRP or Weld mesh. For cladding see External Walls cladding

Rateable element: ss the conveyor is being rated under Class 1 List of Accessories 1 the belt, drive motor and idler sets are not rateable and thus the steel supports

Non-rateable element: Belt, motor and idlers (ss rated under List of Accessories 1).

Adjusted plant and machinery: Platforms, stairways

Number of items adjusted: It is assumed that the item forms part of an "average size industrial, commercial or office complex". Where it would be normal to find more than one item in such a hereditament the ERC stated has been adjusted to reflect any number / quantity, discount. These figures are NOT one off figures.

Contract size adjustment: See Appendix BEAMS Note 2

Cooling Towers

CG Code: 40Z00A

Specific: Concrete Hyperbolic

Descriptive: 30m diameter

Tech 1: -

Tech 2: -

Unit size: -

Unit of measurement: m3

ERC: £809

Superseded codes: -

Location factor: Location Adjustment Applicable (See Guidance Notes) - ERC = UK mean of 1.00

Description: The primary use of large, industrial cooling towers is to remove the heat absorbed in the circulating cooling water systems used in power plants, petroleum refineries, petrochemical and natural gas plants. Cooling towers can also be mechanical small-scale roof-top installations or medium-sized packaged units these have a different Cost Guide Code and are referred to as Mechanical draught. The hyperboloid shape is particularly suited to cooling tower construction as the wide base provides a large space for the water and cooling system. The narrowing effect of the tower helps with the laminar flow of the evaporated water as it rises. As the tower widens out at the top, it supports the turbulent mixing as the heated air makes contact with the atmospheric air. These large cooling towers can be up to 200 metres (660 ft) tall and 100 m (320 ft) in diameter. They are constructed as hyperboloid, doubly-curved concrete shell structures supported on a series of concrete struts. The foundations typically consist of an inclined pond wall forming a circular ‘tee’ beam with a wide concrete strip. The beam acts to resist the lateral load of the tower’s shell structure. As well as the ‘tee’ beam, piled foundations are normally required to minimise differential settlement and reduce the risk of cracking. The cooling system is housed in the tower’s base which is typically the bottom 10 metres, the rest of the tower consisting of an empty shell. The water falls and collects in a pond at the base of the tower, formed by a base slab and the pond wall. In natural-draught cooling towers the open structure at the base allows a natural movement of air.

Referencing details: Base Diameter and height of towers required

Cost information notes: The £cost/m² should be applied to an area arrived at by multiplying the base diameter of the tower at the base of the struts by its height above surface level.

Cranes

CG Code: 214B01

Specific: Gantry Rails and Supports - Integral

Descriptive: Height to Underside of Rail Track

Tech 1: 6 metres

Tech 2: 5 tonnes

Unit size: -

Unit of measurement: m

ERC: £1,058

Superseded codes: -

Location factor: Location Adjustment Applicable (See Guidance Notes) - ERC = UK mean of 1.00

Description: The crane gantry support beam supports the rail track upon which the moving traveller rests. The costs given include the extra foundations, the extra size of the support stanchion, the support beam and the rail track. Most buildings erected with structural steel stanchions are capable of also holding a gantry rail of up to 5 tonnes. In these cases an angle fillet is bolted to the upright projecting into the workshop/warehouse and the rail track support (with rail track on top) is fixed to this.
As the traveller tonnage increases (over 5 tonnes) the upright stanchions, and horizontal beam, (and foundations to the stanchions) are increased in size to accommodate the extra load and thus the costs set out are in part for this ADDITIONAL cost element. This is over and above the figures used for the building framework. The additional steelwork, concrete foundation work, support beam, support flanges and rail track are regarded as Class 4 Table 3 structural supports and ERC provided are all-inclusive. The foundations will be larger to accommodate the extra load and the table includes an item for this element.
Below 5 tonnes the support beam and rail track may be substantial and the cost of this alone can be calculated by using the weight of steel appropriate (See Structural Steelwork supporting structures). Moving beam buffers - these may be of various lengths and where two travellers work the same beam they prevent the two beams from coming too close together. This allows even distribution of weight down through the vertical stanchions. For max weight that rail support and stanchions can take - look at Safe Working Load (SWL) indication on main traveller. DO NOT add the various beam support weights together the max load that can be lifted is the heaviest beam's SWL.

Referencing details: Moving beam buffers - these may be of various lengths and where two travellers work the same beam they prevent the two beams from coming too close together. This allows even distribution of weight down through the vertical stanchions. For max weight that rail support and stanchions can take - look at Safe Working Load (SWL) indication on

main traveller. DO NOT add the various beam support weights together the max load that can be lifted is the heaviest beam's SWL.

Cost information notes: The costs are based on units with a 15m span traveller. The lifting capacity of the crane, height to underside of rail track (top of the track support beam) and the length of the gantry is all that is required to operate the scales (measured between the rails down the middle of the workshop). (Do not hook a metal tape onto the horizontal beam in order to gain the height. Most have exposed electrical cables attached). LINEAR METRE is distance-taking measurement between rail tracks of the length of the rail tracks. (Not always the length of the building) and is NOT the combined length of the two rails. The above costs do not include the moving traveller but do include foundations.

Rateable element: Class 4 Table 3 Foundations, settings, fixed gantries, supports Class 1 Table 1 List of Accessories (i) Travellers, Cranes Class 2 Table 2

Non-rateable element: Under Class 1 or Class 2 if NOT used in connection with fuel for the generation of power or if NOT an accessory to Class 1 or Class 2 item then not rateable under these classes

Adjusted plant and machinery: Moving Traveller (Class 1 and Class 2).

Number of items adjusted: The item can typically be found on an industrial, commercial or office complex. Some hereditaments may have multiple items, in which case the ERC needs to reflect the number of items.

Contract size adjustment: See Appendix BEAMS Note 1

Description: The crane gantry support beam supports the rail track upon which the moving traveller rests. The costs given include the extra foundations, the extra size of the support stanchion, the support beam and the rail track. Most buildings erected with structural steel stanchions are capable of also holding a gantry rail of up to 5 tonnes. In these cases an angle fillet is bolted to the upright projecting into the workshop/warehouse and the rail track support (with rail track on top) is fixed to this.
As the traveller tonnage increases (over 5 tonnes) the upright stanchions, and horizontal beam, (and foundations to the stanchions) are increased in size to accommodate the extra load and thus the costs set out are in part for this ADDITIONAL cost element. This is over and above the figures used for the building framework. The additional steelwork, concrete foundation work, support beam, support flanges and rail track are regarded as Class 4 Table 3 structural supports and ERC provided are all-inclusive. The foundations will be larger to accommodate the extra load and the table includes an item for this element.
Below 5 tonnes the support beam and rail track may be substantial and the cost of this alone can be calculated by using the weight of steel appropriate (See Structural Steelwork supporting structures). Moving beam buffers - these may be of various lengths and where two travellers work the same beam they prevent the two beams from coming too close together. This allows even distribution of weight down through the vertical stanchions. For max weight that rail support and stanchions can take - look at Safe Working Load (SWL) indication on main traveller. DO NOT add the various beam support weights together the max load that can be lifted is the heaviest beam's SWL.

Most buildings erected with structural steel stanchions are capable of also holding a gantry rail of up to 5 tonnes. In these cases an angle fillet is bolted to the upright projecting into the workshop/warehouse and the rail track support (with rail track on top) is fixed to this.
As the traveller tonnage increases (over 5 tonnes) the upright stanchions, and horizontal beam, (and foundations to the stanchions) are increased in size to accommodate the extra load and thus the costs set out are in part for this ADDITIONAL cost element. This is over and above the figures used for the building framework. The additional steelwork, concrete foundation work, support beam, support flanges and rail track are regarded as Class 4 Table 3 structural supports and ERC provided are all-inclusive. The foundations will be larger to accommodate the extra load and the table includes an item for this element.
Below 5 tonnes the support beam and rail track may be substantial and the cost of this alone can be calculated by using the weight of steel appropriate (See Structural Steelwork supporting structures). Moving beam buffers - these may be of various lengths and where two travellers work the same beam they prevent the two beams from coming too close together. This allows even distribution of weight down through the vertical stanchions. For max weight that rail support and stanchions can take - look at Safe Working Load (SWL) indication on main traveller. DO NOT add the various beam support weights together the max load that can be lifted is the heaviest beam's SWL.

Referencing details: Moving beam buffers - these may be of various lengths and where two travellers work the same beam they prevent the two beams from coming too close together. This allows even distribution of weight down through the vertical stanchions. For max weight that rail support and stanchions can take - look at Safe Working Load (SWL) indication on

main traveller. DO NOT add the various beam support weights together the max load that can be lifted is the heaviest beam's SWL.

Cost information notes: The costs are based on units with a 15m span traveller. The lifting capacity of the crane, height to underside of rail track (top of the track support beam) and the length of the gantry is all that is required to operate the scales (measured between the rails down the middle of the workshop). (Do not hook a metal tape onto the horizontal beam in order to gain the height. Most have exposed electrical cables attached). LINEAR METRE is distance-taking measurement between rail tracks of the length of the rail tracks. (Not always the length of the building) and is NOT the combined length of the two rails. The above costs do not include the moving traveller but do include foundations.

Rateable element: Class 4 Table 3 Foundations, settings, fixed gantries, supports Class 1 Table 1 List of Accessories (i) Travellers, Cranes Class 2 Table 2

Non-rateable element: Under Class 1 or Class 2 if NOT used in connection with fuel for the generation of power or if NOT an accessory to Class 1 or Class 2 item then not rateable under these classes

Adjusted plant and machinery: Moving Traveller (Class 1 and Class 2).

Number of items adjusted: The item can typically be found on an industrial, commercial or office complex. Some hereditaments may have multiple items, in which case the ERC needs to reflect the number of items.

Contract size adjustment: See Appendix BEAMS Note 1

This allows even distribution of weight down through the vertical stanchions. For max weight that rail support and stanchions can take - look at Safe Working Load (SWL) indication on main traveller. DO NOT add the various beam support weights together the max load that can be lifted is the heaviest beam's SWL.

Referencing details: Moving beam buffers - these may be of various lengths and where two travellers work the same beam they prevent the two beams from coming too close together. This allows even distribution of weight down through the vertical stanchions. For max weight that rail support and stanchions can take - look at Safe Working Load (SWL) indication on

main traveller. DO NOT add the various beam support weights together the max load that can be lifted is the heaviest beam's SWL.

Cost information notes: The costs are based on units with a 15m span traveller. The lifting capacity of the crane, height to underside of rail track (top of the track support beam) and the length of the gantry is all that is required to operate the scales (measured between the rails down the middle of the workshop). (Do not hook a metal tape onto the horizontal beam in order to gain the height. Most have exposed electrical cables attached). LINEAR METRE is distance-taking measurement between rail tracks of the length of the rail tracks. (Not always the length of the building) and is NOT the combined length of the two rails. The above costs do not include the moving traveller but do include foundations.

Rateable element: Class 4 Table 3 Foundations, settings, fixed gantries, supports Class 1 Table 1 List of Accessories (i) Travellers, Cranes Class 2 Table 2

Non-rateable element: Under Class 1 or Class 2 if NOT used in connection with fuel for the generation of power or if NOT an accessory to Class 1 or Class 2 item then not rateable under these classes

Adjusted plant and machinery: Moving Traveller (Class 1 and Class 2).

Number of items adjusted: The item can typically be found on an industrial, commercial or office complex. Some hereditaments may have multiple items, in which case the ERC needs to reflect the number of items.

Contract size adjustment: See Appendix BEAMS Note 1

Location factor: Location Adjustment Applicable (See Guidance Notes) - ERC = UK mean of 1.00

Description: The crane gantry support beam supports the rail track upon which the moving traveller rests. The costs given include the extra foundations, the extra size of the support stanchion, the support beam and the rail track. Most buildings erected with structural steel stanchions are capable of also holding a gantry rail of up to 5 tonnes. In these cases an angle fillet is bolted to the upright projecting into the workshop/warehouse and the rail track support (with rail track on top) is fixed to this.
As the traveller tonnage increases (over 5 tonnes) the upright stanchions, and horizontal beam, (and foundations to the stanchions) are increased in size to accommodate the extra load and thus the costs set out are in part for this ADDITIONAL cost element. This is over and above the figures used for the building framework. The additional steelwork, concrete foundation work, support beam, support flanges and rail track are regarded as Class 4 Table 3 structural supports and ERC provided are all-inclusive. The foundations will be larger to accommodate the extra load and the table includes an item for this element.
Below 5 tonnes the support beam and rail track may be substantial and the cost of this alone can be calculated by using the weight of steel appropriate (See Structural Steelwork supporting structures). Moving beam buffers - these may be of various lengths and where two travellers work the same beam they prevent the two beams from coming too close together. This allows even distribution of weight down through the vertical stanchions. For max weight that rail support and stanchions can take - look at Safe Working Load (SWL) indication on main traveller. DO NOT add the various beam support weights together the max load that can be lifted is the heaviest beam's SWL.

Description: The crane gantry support beam supports the rail track upon which the moving traveller rests. The costs given include the extra foundations, the extra size of the support stanchion, the support beam and the rail track. Most buildings erected with structural steel stanchions are capable of also holding a gantry rail of up to 5 tonnes. In these cases an angle fillet is bolted to the upright projecting into the workshop/warehouse and the rail track support (with rail track on top) is fixed to this.
As the traveller tonnage increases (over 5 tonnes) the upright stanchions, and horizontal beam, (and foundations to the stanchions) are increased in size to accommodate the extra load and thus the costs set out are in part for this ADDITIONAL cost element. This is over and above the figures used for the building framework. The additional steelwork, concrete foundation work, support beam, support flanges and rail track are regarded as Class 4 Table 3 structural supports and ERC provided are all-inclusive. The foundations will be larger to accommodate the extra load and the table includes an item for this element.
Below 5 tonnes the support beam and rail track may be substantial and the cost of this alone can be calculated by using the weight of steel appropriate (See Structural Steelwork supporting structures). Moving beam buffers - these may be of various lengths and where two travellers work the same beam they prevent the two beams from coming too close together. This allows even distribution of weight down through the vertical stanchions. For max weight that rail support and stanchions can take - look at Safe Working Load (SWL) indication on main traveller. DO NOT add the various beam support weights together the max load that can be lifted is the heaviest beam's SWL.

Referencing details: Moving beam buffers - these may be of various lengths and where two travellers work the same beam they prevent the two beams from coming too close together. This allows even distribution of weight down through the vertical stanchions. For max weight that rail support and stanchions can take - look at Safe Working Load (SWL) indication on

main traveller. DO NOT add the various beam support weights together the max load that can be lifted is the heaviest beam's SWL.

Cost information notes: The costs are based on units with a 15m span traveller. The lifting capacity of the crane, height to underside of rail track (top of the track support beam) and the length of the gantry is all that is required to operate the scales (measured between the rails down the middle of the workshop). (Do not hook a metal tape onto the horizontal beam in order to gain the height. Most have exposed electrical cables attached). LINEAR METRE is distance-taking measurement between rail tracks of the length of the rail tracks. (Not always the length of the building) and is NOT the combined length of the two rails. The above costs do not include the moving traveller but do include foundations.

Rateable element: Class 4 Table 3 Foundations, settings, fixed gantries, supports Class 1 Table 1 List of Accessories (i) Travellers, Cranes Class 2 Table 2

Non-rateable element: Under Class 1 or Class 2 if NOT used in connection with fuel for the generation of power or if NOT an accessory to Class 1 or Class 2 item then not rateable under these classes

Adjusted plant and machinery: Moving Traveller (Class 1 and Class 2).

Number of items adjusted: The item can typically be found on an industrial, commercial or office complex. Some hereditaments may have multiple items, in which case the ERC needs to reflect the number of items.

Cost information notes: The costs are based on units with a 15m span traveller. The lifting capacity of the crane, height to underside of rail track (top of the track support beam) and the length of the gantry is all that is required to operate the scales (measured between the rails down the middle of the workshop). (Do not hook a metal tape onto the horizontal beam in order to gain the height. Most have exposed electrical cables attached). LINEAR METRE is distance-taking measurement between rail tracks of the length of the rail tracks. (Not always the length of the building) and is NOT the combined length of the two rails. The above costs do not include the moving traveller but do include foundations.

Rateable element: Class 4 Table 3 Foundations, settings, fixed gantries, supports Class 1 Table 1 List of Accessories (i) Travellers, Cranes Class 2 Table 2

Non-rateable element: Under Class 1 or Class 2 if NOT used in connection with fuel for the generation of power or if NOT an accessory to Class 1 or Class 2 item then not rateable under these classes

Adjusted plant and machinery: Moving Traveller (Class 1 and Class 2).

Number of items adjusted: The item can typically be found on an industrial, commercial or office complex. Some hereditaments may have multiple items, in which case the ERC needs to reflect the number of items.

Contract size adjustment: See Appendix BEAMS Note 1

Description: The crane gantry support beam supports the rail track upon which the moving traveller rests. The costs given include the extra foundations, the extra size of the support stanchion, the support beam and the rail track. Most buildings erected with structural steel stanchions are capable of also holding a gantry rail of up to 5 tonnes. In these cases an angle fillet is bolted to the upright projecting into the workshop/warehouse and the rail track support (with rail track on top) is fixed to this.
As the traveller tonnage increases (over 5 tonnes) the upright stanchions, and horizontal beam, (and foundations to the stanchions) are increased in size to accommodate the extra load and thus the costs set out are in part for this ADDITIONAL cost element. This is over and above the figures used for the building framework. The additional steelwork, concrete foundation work, support beam, support flanges and rail track are regarded as Class 4 Table 3 structural supports and ERC provided are all-inclusive. The foundations will be larger to accommodate the extra load and the table includes an item for this element.
Below 5 tonnes the support beam and rail track may be substantial and the cost of this alone can be calculated by using the weight of steel appropriate (See Structural Steelwork supporting structures). Moving beam buffers - these may be of various lengths and where two travellers work the same beam they prevent the two beams from coming too close together. This allows even distribution of weight down through the vertical stanchions. For max weight that rail support and stanchions can take - look at Safe Working Load (SWL) indication on main traveller. DO NOT add the various beam support weights together the max load that can be lifted is the heaviest beam's SWL.

Referencing details: Moving beam buffers - these may be of various lengths and where two travellers work the same beam they prevent the two beams from coming too close together. The additional steelwork, concrete foundation work, support beam, support flanges and rail track are regarded as Class 4 Table 3 structural supports and ERC provided are all-inclusive. The foundations will be larger to accommodate the extra load and the table includes an item for this element.
Below 5 tonnes the support beam and rail track may be substantial and the cost of this alone can be calculated by using the weight of steel appropriate (See Structural Steelwork supporting structures). Moving beam buffers - these may be of various lengths and where two travellers work the same beam they prevent the two beams from coming too close together. This allows even distribution of weight down through the vertical stanchions. For max weight that rail support and stanchions can take - look at Safe Working Load (SWL) indication on main traveller. DO NOT add the various beam support weights together the max load that can be lifted is the heaviest beam's SWL.

Referencing details: Moving beam buffers - these may be of various lengths and where two travellers work the same beam they prevent the two beams from coming too close together. This allows even distribution of weight down through the vertical stanchions. For max weight that rail support and stanchions can take - look at Safe Working Load (SWL) indication on

main traveller. DO NOT add the various beam support weights together the max load that can be lifted is the heaviest beam's SWL.

Cost information notes: The costs are based on units with a 15m span traveller. The lifting capacity of the crane, height to underside of rail track (top of the track support beam) and the length of the gantry is all that is required to operate the scales (measured between the rails down the middle of the workshop). (Do not hook a metal tape onto the horizontal beam in order to gain the height. Most have exposed electrical cables attached). LINEAR METRE is distance-taking measurement between rail tracks of the length of the rail tracks. (Not always the length of the building) and is NOT the combined length of the two rails. The above costs do not include the moving traveller but do include foundations.

Rateable element: Class 4 Table 3 Foundations, settings, fixed gantries, supports Class 1 Table 1 List of Accessories (i) Travellers, Cranes Class 2 Table 2

Non-rateable element: Under Class 1 or Class 2 if NOT used in connection with fuel for the generation of power or if NOT an accessory to Class 1 or Class 2 item then not rateable under these classes

Adjusted plant and machinery: Moving Traveller (Class 1 and Class 2).

Number of items adjusted: The item can typically be found on an industrial, commercial or office complex. Some hereditaments may have multiple items, in which case the ERC needs to reflect the number of items.

Contract size adjustment: See Appendix BEAMS Note 1

Description: The crane gantry support beam supports the rail track upon which the moving traveller rests. The costs given include the extra foundations, the extra size of the support stanchion, the support beam and the rail track. Most buildings erected with structural steel stanchions are capable of also holding a gantry rail of up to 5 tonnes. In these cases an angle fillet is bolted to the upright projecting into the workshop/warehouse and the rail track support (with rail track on top) is fixed to this.
As the traveller tonnage increases (over 5 tonnes) the upright stanchions, and horizontal beam, (and foundations to the stanchions) are increased in size to accommodate the extra load and thus the costs set out are in part for this ADDITIONAL cost element. This is over and above the figures used for the building framework. The additional steelwork, concrete foundation work, support beam, support flanges and rail track are regarded as Class 4 Table 3 structural supports and ERC provided are all-inclusive. The foundations will be larger to accommodate the extra load and the table includes an item for this element.
Below 5 tonnes the support beam and rail track may be substantial and the cost of this alone can be calculated by using the weight of steel appropriate (See Structural Steelwork supporting structures). Tech 2: 40 tonnes

Unit size: -

Unit of measurement: m

ERC: £3,274

Superseded codes: 214BBL, 214BBS

Location factor: Location Adjustment Applicable (See Guidance Notes) - ERC = UK mean of 1.00

Description: The crane gantry support beam supports the rail track upon which the moving traveller rests. The costs given include the extra foundations, the extra size of the support stanchion, the support beam and the rail track. Most buildings erected with structural steel stanchions are capable of also holding a gantry rail of up to 5 tonnes. In these cases an angle fillet is bolted to the upright projecting into the workshop/warehouse and the rail track support (with rail track on top) is fixed to this.
As the traveller tonnage increases (over 5 tonnes) the upright stanchions, and horizontal beam, (and foundations to the stanchions) are increased in size to accommodate the extra load and thus the costs set out are in part for this ADDITIONAL cost element. This is over and above the figures used for the building framework. The additional steelwork, concrete foundation work, support beam, support flanges and rail track are regarded as Class 4 Table 3 structural supports and ERC provided are all-inclusive. The foundations will be larger to accommodate the extra load and the table includes an item for this element.
Below 5 tonnes the support beam and rail track may be substantial and the cost of this alone can be calculated by using the weight of steel appropriate (See Structural Steelwork supporting structures). Moving beam buffers - these may be of various lengths and where two travellers work the same beam they prevent the two beams from coming too close together. This allows even distribution of weight down through the vertical stanchions. For max weight that rail support and stanchions can take - look at Safe Working Load (SWL) indication on main traveller. DO NOT add the various beam support weights together the max load that can be lifted is the heaviest beam's SWL.

Referencing details: Moving beam buffers - these may be of various lengths and where two travellers work the same beam they prevent the two beams from coming too close together. This allows even distribution of weight down through the vertical stanchions. For max weight that rail support and stanchions can take - look at Safe Working Load (SWL) indication on

main traveller. DO NOT add the various beam support weights together the max load that can be lifted is the heaviest beam's SWL.

Cost information notes: The costs are based on units with a 15m span traveller. The lifting capacity of the crane, height to underside of rail track (top of the track support beam) and the length of the gantry is all that is required to operate the scales (measured between the rails down the middle of the workshop). (Do not hook a metal tape onto the horizontal beam in order to gain the height. Most have exposed electrical cables attached). LINEAR METRE is distance-taking measurement between rail tracks of the length of the rail tracks. (Not always the length of the building) and is NOT the combined length of the two rails. The above costs do not include the moving traveller but do include foundations.

Rateable element: Class 4 Table 3 Foundations, settings, fixed gantries, supports Class 1 Table 1 List of Accessories (i) Travellers, Cranes Class 2 Table 2

Non-rateable element: Under Class 1 or Class 2 if NOT used in connection with fuel for the generation of power or if NOT an accessory to Class 1 or Class 2 item then not rateable under these classes

Adjusted plant and machinery: Moving Traveller (Class 1 and Class 2).

Number of items adjusted: The item can typically be found on an industrial, commercial or office complex. Some hereditaments may have multiple items, in which case the ERC needs to reflect the number of items.

Contract size adjustment: See Appendix BEAMS Note 1

Cost information notes: The costs are based on units with a 15m span traveller. The lifting capacity of the crane, height to underside of rail track (top of the track support beam) and the length of the gantry is all that is required to operate the scales (measured between the rails down the middle of the workshop). (Do not hook a metal tape onto the horizontal beam in order to gain the height. Most have exposed electrical cables attached). LINEAR METRE is distance-taking measurement between rail tracks of the length of the rail tracks. (Not always the length of the building) and is NOT the combined length of the two rails. The above costs do not include the moving traveller but do include foundations.

Rateable element: Class 4 Table 3 Foundations, settings, fixed gantries, supports Class 1 Table 1 List of Accessories (i) Travellers, Cranes Class 2 Table 2

Non-rateable element: Under Class 1 or Class 2 if NOT used in connection with fuel for the generation of power or if NOT an accessory to Class 1 or Class 2 item then not rateable under these classes

Adjusted plant and machinery: Moving Traveller (Class 1 and Class 2).

Number of items adjusted: The item can typically be found on an industrial, commercial or office complex. Some hereditaments may have multiple items, in which case the ERC needs to reflect the number of items.

Contract size adjustment: See Appendix BEAMS Note 1

Location factor: Location Adjustment Applicable (See Guidance Notes) - ERC = UK mean of 1.00

Description: The crane gantry support beam supports the rail track upon which the moving traveller rests. The costs given include the extra foundations, the extra size of the support stanchion, the support beam and the rail track. Most buildings erected with structural steel stanchions are capable of also holding a gantry rail of up to 5 tonnes. In these cases an angle fillet is bolted to the upright projecting into the workshop/warehouse and the rail track support (with rail track on top) is fixed to this.
As the traveller tonnage increases (over 5 tonnes) the upright stanchions, and horizontal beam, (and foundations to the stanchions) are increased in size to accommodate the extra load and thus the costs set out are in part for this ADDITIONAL cost element. This is over and above the figures used for the building framework. The additional steelwork, concrete foundation work, support beam, support flanges and rail track are regarded as Class 4 Table 3 structural supports and ERC provided are all-inclusive. The foundations will be larger to accommodate the extra load and the table includes an item for this element.
Below 5 tonnes the support beam and rail track may be substantial and the cost of this alone can be calculated by using the weight of steel appropriate (See Structural Steelwork supporting structures). Moving beam buffers - these may be of various lengths and where two travellers work the same beam they prevent the two beams from coming too close together. This allows even distribution of weight down through the vertical stanchions. For max weight that rail support and stanchions can take - look at Safe Working Load (SWL) indication on main traveller. DO NOT add the various beam support weights together the max load that can be lifted is the heaviest beam's SWL.

Referencing details: Moving beam buffers - these may be of various lengths and where two travellers work the same beam they prevent the two beams from coming too close together. As the traveller tonnage increases (over 5 tonnes) the upright stanchions, and horizontal beam, (and foundations to the stanchions) are increased in size to accommodate the extra load and thus the costs set out are in part for this ADDITIONAL cost element. This is over and above the figures used for the building framework. The additional steelwork, concrete foundation work, support beam, support flanges and rail track are regarded as Class 4 Table 3 structural supports and ERC provided are all-inclusive. The foundations will be larger to accommodate the extra load and the table includes an item for this element.
Below 5 tonnes the support beam and rail track may be substantial and the cost of this alone can be calculated by using the weight of steel appropriate (See Structural Steelwork supporting structures). Moving beam buffers - these may be of various lengths and where two travellers work the same beam they prevent the two beams from coming too close together. This allows even distribution of weight down through the vertical stanchions. For max weight that rail support and stanchions can take - look at Safe Working Load (SWL) indication on main traveller. DO NOT add the various beam support weights together the max load that can be lifted is the heaviest beam's SWL.

Referencing details: Moving beam buffers - these may be of various lengths and where two travellers work the same beam they prevent the two beams from coming too close together. This allows even distribution of weight down through the vertical stanchions. For max weight that rail support and stanchions can take - look at Safe Working Load (SWL) indication on

main traveller. DO NOT add the various beam support weights together the max load that can be lifted is the heaviest beam's SWL.

Cost information notes: The costs are based on units with a 15m span traveller. The lifting capacity of the crane, height to underside of rail track (top of the track support beam) and the length of the gantry is all that is required to operate the scales (measured between the rails down the middle of the workshop). (Do not hook a metal tape onto the horizontal beam in order to gain the height. Most have exposed electrical cables attached). LINEAR METRE is distance-taking measurement between rail tracks of the length of the rail tracks. (Not always the length of the building) and is NOT the combined length of the two rails. The above costs do not include the moving traveller but do include foundations.

Rateable element: Class 4 Table 3 Foundations, settings, fixed gantries, supports Class 1 Table 1 List of Accessories (i) Travellers, Cranes Class 2 Table 2

Non-rateable element: Under Class 1 or Class 2 if NOT used in connection with fuel for the generation of power or if NOT an accessory to Class 1 or Class 2 item then not rateable under these classes

Adjusted plant and machinery: Moving Traveller (Class 1 and Class 2).

Number of items adjusted: The item can typically be found on an industrial, commercial or office complex. Some hereditaments may have multiple items, in which case the ERC needs to reflect the number of items.

Contract size adjustment: See Appendix BEAMS Note 1

Description: The crane gantry support beam supports the rail track upon which the moving traveller rests. The costs given include the extra foundations, the extra size of the support stanchion, the support beam and the rail track. Most buildings erected with structural steel stanchions are capable of also holding a gantry rail of up to 5 tonnes. In these cases an angle fillet is bolted to the upright projecting into the workshop/warehouse and the rail track support (with rail track on top) is fixed to this.
As the traveller tonnage increases (over 5 tonnes) the upright stanchions, and horizontal beam, (and foundations to the stanchions) are increased in size to accommodate the extra load and thus the costs set out are in part for this ADDITIONAL cost element. This is over and above the figures used for the building framework. Description: The Overhead crane structure is free standing (not forming an integral part of a building). This item can be found inside or outside a building. For overhead cranes where the structural support is integral with that of the building see 214B- series.
The moving traveller is not rateable nor is the lifting gear mechanism.
The rail track, supporting beam, vertical stanchions and foundations are rateable.
The structure is rateable no matter what the lifting capacity of the beam is. (Contrast this with the beam that is an integral part of the building)
The supporting steelwork, concrete foundation work, support beam, support flanges and rail track are regarded as Class 4 Table 3 structural supports and the ERCs provided are all-inclusive. The concrete foundations will be larger to accommodate the extra load and the table includes an item for this element.
Below 5 tonnes the support beam and rail track may be substantial and the cost of this alone can be calculated by using the weight of steel appropriate. See Structural Steelwork-supporting structures.

Referencing details: The lifting capacity of the crane, height to underside of rail track (top of the track support beam) and the length of the gantry is all that is required to operate the scales (measured between the rails down the middle of the workshop). (Do not hook a metal tape onto the horizontal beam in order to gain the height. Most have exposed electrical cables attached).

Cost information notes: The costs are based on a standard 15m span for the traveller. LINEAR METREAGE is the length of the rail track (or the distance that the crane travels over). (Not always the length of the building) and is NOT the combined length of the two rails.

Rateable element: Class 4 Table 3 Foundations, settings, fixed gantries, supports Class 1 Table 1 List of Accessories (i) Travellers, Cranes Class 2 Table 2

Non-rateable element: Under Class 1 or Class 2 if NOT used in connection with fuel for the generation of power or if NOT an accessory to Class 1 or Class 2 item then not rateable under these classes

Adjusted plant and machinery: Moving Traveller (Class 1 and Class 2).

Number of items adjusted: The item can typically be found on an industrial, commercial or office complex. Some hereditaments may have multiple items, in which case the ERC needs to reflect the number of items.

Contract size adjustment: See Appendix BEAMS Note 2

Variations: It is envisaged that no extra costs to the freestanding prices would be applicable if the freestanding gantry were OUTSIDE.

Location factor: Considered Not Applicable at time of Publication

Description: A type of fixed position crane used in workshops and other industrial settings usually comprising a vertical steel support bolted to the floor with a horizontal swinging jib. Occasionally the jib is bolted directly to a suitable vertical building support. A manual or electric hoist is hung from the jib arm. Cost includes hoist.

Referencing details: Record height of support and length of jib arm. Record maximum capacity in kg, if not marked record capacity of hoist. Record fixing method and size of base if identifiable.

Cost information notes: Costs for jib cranes including excluding lifting gear see coded 214J21 to 214J25

Location factor: Considered Not Applicable at time of Publication

Description: Hot Water Distribution Pipe

Referencing details: Measure the pipe run in metres. If pipes are out of sight obtain details from the scheme operator.

Cost information notes: Includes fittings. See separate Cost Guide entries for pipes buried in the ground. For projects under 100m in length add 35%. Cost given is per m for a single pipe run.

Rateable element: Pipes per Class 3 (g)

Non-rateable element: -

Adjusted plant and machinery: Refer to Rating Manual Section 5a Valuation of all property classes : District Heating Undertakings.

Number of items adjusted: -

Contract size adjustment: See Appendix BEAMS Note 1

Variations: See separate codes for alternative sizes and for buried pipes.

District Heating Pipework

CG Code: 216P16

Specific: Insulated Pipe 50mm

Descriptive: Hot Water Distribution Pipe

Tech 1: Integral Insulation

Tech 2: Buried in hard ground

Unit size: Per linear m

Unit of measurement: m

ERC: £467

Superseded codes: -

Location factor: Considered Not Applicable at time of Publication

Description: Hot Water Distribution Pipe

Referencing details: Measure the pipe run in metres. If pipes are out of sight obtain details from the scheme operator.

Description: Generally detached single-storey building comprising training workshops for construction or mechanical trades alongside ancillary accommodation including toilet facilities, staff offices, stores and plant rooms. Minimal basic classroom provision may also be present. Commonly of framed construction with a range of cladding to elevations surmounted by a composite metal panel clad pitched roof. Roller shutter doors frequently present. Internal finishes and fixtures vary depending on accommodation usage with painted blockwork walls, exposed concrete floors and exposed underside of roof common to workshop areas. Services comprise central heating (radiant panels typical to workshop areas), ventilation and dust extraction, lighting and power, sanitary and plumbing installations and limited communication and security installations including fire detection and alarm systems. In addition, various sustainable features, such as photovoltaic panels, may be present.

Description: High Voltage Cables are rateable under Class 1 Table 1 (f) Cables ..... and Class 2 List of Accessories 2 (vii). The cables are made from a copper core, which is surrounded in e.g. paper / resin which acts as an insulator. Around this insulation is woven a lead " cloth " which acts as protection / support. Finally there is a plastic cover (usually black) which adds water protection. It is usually the larger cables (both in physical size and capacity carried) that are noted as rateable. Rateable cables are usually from the boundary fence / generator to the transformer or distribution board. Cables run inside building in cable trays whereas most external cables run underground in a sand trench. The actual cable is often in a clayware duct. Typical sizes 3800/6600V, 6350/11000V, 8700/15000V, 12700/22000V, 19000/33000V. Types of construction - Single core cable: copper wire screened, un-armoured, PCV over-sheath, circular stranded conductor, conductor screen, XLPE insulation, extruded semi-conducting layer, semi-conductor tape, copper wire screen, PVC over-sheath
Single core cable: copper tape screened, aluminium wire armoured, PCV over-sheath, circular stranded conductor, conductor screen, XLPE insulation, extruded semi-conducting layer, copper tape screen, PVC sheath, aluminium wire armour PVC over-sheath.
Three core cable: copper tape screened, single wire armoured, PCV over-sheath, circular stranded conductor, conductor screen, XLPE insulation, extruded semi-conducting layer, copper tape screen, Non-hygroscopic filler, synthetic tape PVC sheath, galvanized steel wire armour, PVC over-sheath.

Referencing details: Where runs are not available adopt 250 m run per circuit.

Cost information notes: Cost are based on 1000m run of cabling Cable costs are for :- Cables in support trays or attached to walls (normal) Cables in a trench underground. (across site or building to building) Cables in a concrete duct with metal top (inside power house / switch room)

Rateable element: Class 1 Table 1 (f) Cables and Conductors Class 1 and 2 - List of Accessories (2) (vii) cables, wires

Non-rateable element: -

Adjusted plant and machinery: Switches, Transformers, Bus Bar (distribution board.)

Number of items adjusted: The item can typically be found on an industrial, commercial or office complex. Some hereditaments may have multiple items, in which case the ERC needs to reflect the number of items.

Finally there is a plastic cover (usually black) which adds water protection. It is usually the larger cables (both in physical size and capacity carried) that are noted as rateable. Rateable cables are usually from the boundary fence / generator to the transformer or distribution board. Cables run inside building in cable trays whereas most external cables run underground in a sand trench. The actual cable is often in a clayware duct. Typical sizes 3800/6600V, 6350/11000V, 8700/15000V, 12700/22000V, 19000/33000V. Types of construction - Single core cable: copper wire screened, un-armoured, PCV over-sheath, circular stranded conductor, conductor screen, XLPE insulation, extruded semi-conducting layer, semi-conductor tape, copper wire screen, PVC over-sheath
Single core cable: copper tape screened, aluminium wire armoured, PCV over-sheath, circular stranded conductor, conductor screen, XLPE insulation, extruded semi-conducting layer, copper tape screen, PVC sheath, aluminium wire armour PVC over-sheath.
Three core cable: copper tape screened, single wire armoured, PCV over-sheath, circular stranded conductor, conductor screen, XLPE insulation, extruded semi-conducting layer, copper tape screen, Non-hygroscopic filler, synthetic tape PVC sheath, galvanized steel wire armour, PVC over-sheath.

Referencing details: Where runs are not available adopt 250 m run per circuit.

Cost information notes: Cost are based on 1000m run of cabling Cable costs are for :- Cables in support trays or attached to walls (normal) Cables in a trench underground. (across site or building to building) Cables in a concrete duct with metal top (inside power house / switch room)

Rateable element: Class 1 Table 1 (f) Cables and Conductors Class 1 and 2 - List of Accessories (2) (vii) cables, wires

Non-rateable element: -

Adjusted plant and machinery: Switches, Transformers, Bus Bar (distribution board.)

Number of items adjusted: The item can typically be found on an industrial, commercial or office complex. Some hereditaments may have multiple items, in which case the ERC needs to reflect the number of items.

Unit size: ONE

Unit of measurement: Each

ERC: £31,140

Superseded codes: -

Location factor: Considered Not Applicable at time of Publication

Description: Transformers 11kV to 415V The most common rateable transformer sitting inside the boundary fence and dropping the voltage down to 415V before the first distribution board. This size of transformer may be inside (as part of the switch house) or outside in a pen or behind safety fencing.

Referencing details: Transformers are dangerous. Do not get too close and only under supervision. Most have a plate on them giving the kVa and the upper and lower voltage. Ask the engineer for a SCHEMATIC in order to work out if they are rateable or not.

Cost information notes: -

Rateable element: Class 1 Table 1 (e) Main transmission of power - Class 1(i) (in the case of electrical power, the first distribution board). Transformer

Non-rateable element: If part of process e.g. Electric Arc Furnace Transformer

Adjusted plant and machinery: Cables and conductors, switch boards, distribution boards, control panels, and all switchgear and other apparatus thereon.

Number of items adjusted: The item can typically be found on an industrial, commercial or office complex. Some hereditaments may have multiple items, in which case the ERC needs to reflect the number of items.

Location factor: Considered Not Applicable at time of Publication

Description: A transformer changes an AC (alternating current) from one voltage to another, here 3,300V to 415V They are only found in large heavy works, either in an external pen behind safety fencing or within the switch house.

Referencing details: Transformers are dangerous. Do not get too close and only under supervision. Most have a plate on them giving the kVa and the upper and lower voltage. Ask the engineer for a SCHEMATIC in order to work out if they are rateable or not.

Cost information notes: -

Rateable element: Class 1 Table 1 (e) Main transmission of power - Class 1(i) (in the case of electrical power, the first distribution board). Transformer

Non-rateable element: If part of process e.g. Electric Arc Furnace Transformer

Adjusted plant and machinery: Cables and conductors, switch boards, distribution boards, control panels, and all switchgear and other apparatus thereon.

Number of items adjusted: The item can typically be found on an industrial, commercial or office complex. Some hereditaments may have multiple items, in which case the ERC needs to reflect the number of items.

Contract size adjustment: See Appendix BEAMS Note 1

Unit size: -

Unit of measurement: Each

ERC: £29,794

Superseded codes: -

Location factor: Considered Not Applicable at time of Publication

Description: A circuit breaker is an automatically operated switch that is used to isolate a circuit or large item of machinery from the incoming power. It is designed to operate when a fault condition arises e.g. short circuit or overload, in the same way as a fuse. However it can be reset when the fault condition has been removed. When breaking a high power circuit an arc (or spark) occurs, this can damage the circuit breaker and if the arc is continuous the circuit will not be fully isolated. To prevent this the arc is suppressed by having the contacts surrounded by Sulphur hexafluoride gas (SF6), under oil, in a vacuum or by using an air blast. All types are currently in use but the gas or vacuum type are generally installed, in new systems.

Referencing details: Voltage of circuit i.e. 3.3kV, Breaking capacity i.e. MVA, Current (amps) i.e.630 amp. Age. Indoors or outdoors.

Cost information notes: -

Rateable element: A schematic MUST be studied. See Class 1 © (i) Class 1 Table 1 (d) and (f) note:- may be attached under first distribution board but still rateable. If in a different location but still qualifies as the first switch after the distribution board then it is not rateable.

Non-rateable element: After first distribution board - see note in rateable element.

Adjusted plant and machinery: The item can typically be found on an industrial, commercial or office complex. Some hereditaments may have multiple items, in which case the ERC needs to reflect the number of items.

Number of items adjusted: Distribution Board, Bus Bar, Generator, Cable, Transformer, Rectifier.

To prevent this the arc is suppressed by having the contacts surrounded by Sulphur hexafluoride gas (SF6), under oil, in a vacuum or by using an air blast. All types are currently in use but the gas or vacuum type are generally installed, in new systems.

Referencing details: Voltage of circuit i.e. 3.3kV, Breaking capacity i.e. MVA, Current (amps) i.e.630 amp. Age. Indoors or outdoors.

Cost information notes: -

Rateable element: A schematic MUST be studied. See Class 1 © (i) Class 1 Table 1 (d) and (f) note:- may be attached under first distribution board but still rateable. If in different location but still qualifies as the first switch after the distribution board then not rateable.

Non-rateable element: After first distribution board - see note in rateable element.

Adjusted plant and machinery: The item can typically be found on an industrial, commercial or office complex. Some hereditaments may have multiple items, in which case the ERC needs to reflect the number of items.

Number of items adjusted: Distribution Board, Bus Bar, Generator, Cable, Transformer, Rectifier.

Contract size adjustment: See Appendix BEAMS Note 1

Description: A circuit breaker is an automatically operated switch that is used to isolate a circuit or large item of machinery from the incoming power. It is designed to operate when a fault condition arises e.g. short circuit or overload, in the same way as a fuse. However it can be reset when the fault condition has been removed. When breaking a high power circuit an arc (or spark) occurs, this can damage the circuit breaker and if the arc is continuous the circuit will not be fully isolated. To prevent this the arc is suppressed by having the contacts surrounded by Sulphur hexafluoride gas (SF6), under oil, in a vacuum or by using an air blast. All types are currently in use but the gas or vacuum type are generally installed, in new systems.

Referencing details: Voltage of circuit i.e. 3.3kV, Breaking capacity i.e. mVa, Current (amps) i.e.2,000 amp. Age. Indoors or outdoors.

Description: A circuit breaker is an automatically operated switch that is used to isolate a circuit or large item of machinery from the incoming power. It is designed to operate when a fault condition arises e.g. short circuit or overload, in the same way as a fuse. However it can be reset when the fault condition has been removed. When breaking a high power circuit an arc (or spark) occurs, this can damage the circuit breaker and if the arc is continuous the circuit will not be fully isolated. To prevent this the arc is suppressed by having the contacts surrounded by Sulphur hexafluoride gas (SF6), under oil, in a vacuum or by using an air blast. All types are currently in use but the gas or vacuum type are generally installed, in new systems.

Referencing details: Voltage of circuit i.e. 11kV, Breaking capacity i.e. MVA, Current (amps) e.g. 2,000 amp. Age. Indoors or outdoors.

Cost information notes: -

Description: A circuit breaker is an automatically operated switch that is used to isolate a circuit or large item of machinery from the incoming power. It is designed to operate when a fault condition arises e.g. short circuit or overload, in the same way as a fuse. However it can be reset when the fault condition has been removed. When breaking a high power circuit an arc (or spark) occurs, this can damage the circuit breaker and if the arc is continuous the circuit will not be fully isolated. To prevent this the arc is suppressed by having the contacts surrounded by Sulphur hexafluoride gas (SF6), under oil, in a vacuum or by using an air blast. All types are currently in use but the gas or vacuum type are generally installed, in new systems.

Referencing details: Voltage of circuit i.e. 11kV, Breaking capacity i.e. MVA, Current (amps) e.g. 2,000 amp. Age. Indoors or outdoors.

Cost information notes: -

Rateable element: A schematic MUST be studied. See Class 1 © (i) Class 1 Table 1 (d) and (f) note:- may be attached under first distribution board but still rateable. If different location but first switch after distribution board - not rateable.

Non-rateable element: After first distribution board - see note in rateable element.

Adjusted plant and machinery: The item can typically be found on an industrial, commercial or office complex. Some hereditaments may have multiple items, in which case the ERC needs to reflect the number of items.

Number of items adjusted: Distribution Board, Bus Bar, Generator, Cable, Transformer, Rectifier.

Contract size adjustment: See Appendix BEAMS Note 1

Description: A circuit breaker is an automatically operated switch that is used to isolate a circuit or large item of machinery from the incoming power. It is designed to operate when a fault condition arises e.g. short circuit or overload, in the same way as a fuse. However it can be reset when the fault condition has been removed. When breaking a high power circuit an arc (or spark) occurs, this can damage the circuit breaker and if the arc is continuous the circuit will not be fully isolated. To prevent this the arc is suppressed by having the contacts surrounded by Sulphur hexafluoride gas (SF6), under oil, in a vacuum or by using an air blast. All types are currently in use but the gas or vacuum type are generally installed, in new systems.

Referencing details: Voltage of circuit i.e. 11kV, Breaking capacity i.e. MVA, Current (amps) e.g. 2,000 amp. Age. Indoors or outdoors.
