Descriptive: Pitched roof

Tech 1: 26.0m² - 50m²

Tech 2: 4.5m ht

Unit size: -

Unit of measurement: m2

ERC: £1,075

Superseded codes: -

Location factor: Location Adjustment Applicable (See Guidance Notes) - ERC = UK mean of 1.00

Description: The building is assumed to be single storey of traditional form of construction, brick cladding and varying heights. An average size is adopted based on the size ranges given with an assumed rectangular floor plate. All buildings are assumed to have a pitched roof profile with lighting and power only allowed as Mechanical & Electrical services.

Referencing details: Measure to GIA. Height. Note basement, size, finishes and access.

Cost information notes: Cost excludes external works.

Rateable element: -

Non-rateable element: -

Adjusted plant and machinery: Chambers, pits, walkways.

Number of items adjusted: -

Contract size adjustment: See Appendix BEAMS Note 2

Variations: If a concrete flat roof is required, deduct using code 63M0V1. Gross Internal Area (GIA) in lieu of pitch roof. Cost excludes heating installations.

Railways

CG Code: 219A11

Specific: Trackwork Plain Line

Descriptive: Rail line for use within train depots, train maintenance facilities, freight terminals, marshalling yards and the like.

Tech 1: Flat bottom rail; BS 11; Delivered in standard 18.288m lengths. BS113'A' Section, 56kg/m.

Tech 2: On and including softwood sleepers, clips, pandrols etc. Jointed track.

Unit size: linear metre

Unit of measurement: m

ERC: £594

Superseded codes: 219F01, 219L01, 219T01, 219T02, 219TL1, 219TL2, 219TL3

Location factor: Location Adjustment Applicable (See Guidance Notes) - ERC = UK mean of 1.00

Description: Cost includes for all the necessary, materials, labour and plant to provide one metre of low speed rail line.

Referencing details: Measure linear length. N.B. The cost is for low speed secondary lines only and is only applicable to branch lines, sidings or depots.

Cost information notes: All the costs given in the Railways section of the Cost Guide are for "Green Zone "working.

Rateable element: Class 3 (a) (Railway and tramway lines and tracks (other than tracks used exclusively for the transmission of power)

Non-rateable element: -

Adjusted plant and machinery: -

Number of items adjusted: The item can typically be found on an industrial or commercial complex. Some hereditaments may have multiple items, in which case the ERC needs to reflect the number of items.

Contract size adjustment: See Appendix BEAMS Note 1

Railways

CG Code: 219D13

Specific: Catch Points

Descriptive: Prefabricated turnouts

Tech 1: Type BX8; BS113A section flat bottom rail with timber bearers

Tech 2: -

Unit size: -

Unit of measurement: Each

ERC: £31,139

Superseded codes: 219D11, 219D12, 219D14, 219D31

Location factor: Location Adjustment Applicable (See Guidance Notes) - ERC = UK mean of 1.00

Description: Catch points and Trap points are types of turnout which act as railway safety devices. Both work by guiding railway carriages and trucks from a dangerous route onto a separate, safer track. Catch points are used to derail vehicles which are out of control on steep slopes (known as runaways). Trap points are used to protect main railway lines from unauthorised vehicles moving onto them from sidings or branch lines.

Referencing details: -

Cost information notes: All the costs given in the Railways section of the Cost Guide are for “Green Zone “working.

Rateable element: -

Non-rateable element: -

Adjusted plant and machinery: Rail track, buffers

Number of items adjusted: The item can typically be found on an industrial or commercial complex. Some hereditaments may have multiple items, in which case the ERC needs to reflect the number of items.

Contract size adjustment: See Appendix BEAMS Note 1

Variations: -

Railways

CG Code: 219J11

Specific: Points (Turnouts)

Tech 1: Type BX8; BS113A section flat bottom rail with timber bearers

Tech 2: -

Unit size: -

Unit of measurement: Each

ERC: £31,139

Superseded codes: -

Location factor: Location Adjustment Applicable (See Guidance Notes) - ERC = UK mean of 1.00

Description: Points (UK) Turnouts (USA) are the terms used to describe the junctions in trackwork where lines diverge or converge. They are normally prefabricated and dropped into position before connecting to the rail network. The unit will comprise of the steel rails and the timber/concrete or steel sleepers underneath. The points are controlled by electro mechanical or manual means. Within depots, freight yards etc the points connecting the facility to the main line are likely to be electro mechanical with the points inside the facility varying depending on the train movements at that location. The cost does not include points control mechanisms.

Referencing details: -

Cost information notes: All the costs given in the Railways section of the Cost Guide are for “Green Zone “working.

Rateable element: Class 3 (a) (iii) points Ballast and sub ballast are assumed to be rateable as part of the land on which tracks are laid and the cost thereof should be included within the improved land value

They are normally prefabricated and dropped into position before connecting to the rail network. The unit will comprise of the steel rails and the timber/concrete or steel sleepers underneath. The points are controlled by electro mechanical or manual means. Within depots, freight yards etc the points connecting the facility to the main line are likely to be electro mechanical with the points inside the facility varying depending on the train movements at that location. The cost does not include points control mechanisms.

Referencing details: -

Cost information notes: All the costs given in the Railways section of the Cost Guide are for "Green Zone "working.

Rateable element: Class 3 (a) (iii) points Ballast and sub ballast are assumed to be rateable as part of the land on which tracks are laid and the cost thereof should be included within the improved land value

Non-rateable element: -

Adjusted plant and machinery: Track

Number of items adjusted: The item can typically be found on an industrial or commercial complex. Some hereditaments may have multiple items, in which case the ERC needs to reflect the number of items.

Contract size adjustment: See Appendix BEAMS Note 1

Variations: -

Tech 2: -

Unit size: Each

Unit of measurement: Each

ERC: £7,475

Superseded codes: 219GA1, 219GA2, 219R01, 219R02, 219S01

Location factor: Location Adjustment Applicable (See Guidance Notes) - ERC = UK mean of 1.00

Description: Usually consisting of an I section stanchion set in a concrete base at regular intervals at the side of the track. These stanchions carry the support wires, which in turn support the power cables over the track. For areas where several power cables are supported I sections of 100mm x 200mm can be found whereas when the support is over a single track a 100 mm diameter pole is adopted. Support wires hold the power cables or an insulated support holds the power wire direct.

Referencing details: The section and type of stanchion is required. The height from the foundation and intervals if relevant. It is assumed that the stanchion is set in a concrete foundation. For Gantries the type of construction and size of the gantry is required as well as the height above the foundation.

Cost information notes: All the costs given in the Railways section of the Cost Guide are for “Green Zone “working.

Rateable element: Power wire. Supports. Power wire gantries

Non-rateable element: -

Adjusted plant and machinery: -

Railways

CG Code: 219X02

Specific: Rail road crossings

Descriptive: Railway level crossing across a one carriageway wide road

Tech 1: Manually operated timber gates

Tech 2: -

Unit size: linear metre

Unit of measurement: Each

ERC: £7,652

Superseded codes: 219G01, 219G02, 219X01

Location factor: Location Adjustment Applicable (See Guidance Notes) - ERC = UK mean of 1.00

Description: These occur when the railway line crosses a road. It is unusual for this to occur across a public highway and the assessment is in the same occupation. There are occasions where the crossing is within a privately owned hereditament. In the latter case the gates are opened manually at the crossing but normally cameras - relays will indicate a train arrival and the gates will be operated. Train speeds on-site are very low. The road width will usually be such that a single arm would be sufficient.

Referencing details: The width of the arm and the means of operation. i.e. opened at the point of crossing or remotely via a control room. The distance between the arms (single track or double track). The number of arms (usually 2). The construction of the roadway round the rail track. (usually this is concrete or tarmac but some crossings adopt a flexible material)

Cost information notes: All the costs given in the Railways section of the Cost Guide are for “Green Zone “working.

Rateable element: Crossings - gates - barriers

Non-rateable element: -

Adjusted plant and machinery: Track support and foundations, sleepers, settings and fittings.

Number of items adjusted: The item can typically be found on an industrial or commercial complex. Some hereditaments may have multiple items, in which case the ERC needs to reflect the number of items.

Contract size adjustment: See Appendix BEAMS Note 1

Variations: -

Refining

CG Code: 213A01

Specific: Fractionation Towers

Descriptive: Cast Iron (excel int trays)

Tech 1: 1.02 diameter

Tech 2: 17m high

Unit size: one

Unit of measurement: Each

ERC: £121,294

Superseded codes: -

Location factor: Considered Not Applicable at time of Publication

Description: Otherwise known as a column. Crude oil is rarely useable as such and must therefore be refined. This is achieved by distillation - crude oil is heated until it is vaporised and then cooled forming liquids according to the boiling points of their constituent molecules. From Refinery storage tanks crude oil is pumped through horizontal steel tubes arranged on the inside walls and the roof of a furnace (oil is unable to ignite as no air is present in the tubes). The oil with a temperature in excess of 300°C goes from the tubes into the lower part of a tall cylindrical tower COLUMN up to 7.5m diameter x 30.48m high FRACTIONATING TOWER. The vapour floats upwards into the fractionating tower - a tower from which fractions are obtained. The tower is divided into numerous compartments by means of trays. The vapours pass through holes in the trays. The higher the room (area above a tray) the cooler the temperature. As vapours rise they are cooled and liquids are condensed. The hydrocarbon vapours with the highest boiling points cool and condense first on the bottom trays. The most volatile (e.g. petrol) comes off the top as vapour and is separately cooled. The division of crude oil into fractions or distillates is made more exacting by using bubble caps (see sketch). By this method hot vapours passing through the holes in the tray are forced to bubble through cooler liquid, which has already been condensed and collected on the tray. Hot vapours boil off any light hydrocarbons on the tray. There may be a series of towers refining the oil again and again, these are known as "SIDE STRIPPERS". Columns are costed with regard to their weight of steel. The costs reflect the mild steel skirt irrespective of the material used in the column construction. The diameters and heights given are for the column only. The cost includes a mild steel skirt. Any brickwork (usually fire protection) over the metal skirt requires an addition. Add 20% (to include for shapes, formation etc.) to scales. The diameters and heights given are for the column only. Additions should be made for foundations and piles. In calculating the volume for class 4 purposes the skirt should be included.

Referencing details: (a) Number (Refinery serial no) and user i.e. No 1 Crude, 2nd stage distillation etc. (b) Overall height - including skirt. (c) Diameter - in the case of columns of

varying diameters the length diameter of each different section should be given. (d) Height of skirt whether clad or bricked. (e) If lagged - the material used, its thickness and details of outer cover. (f) Operating pressure. (g) Weight of shell steel tonnes (excluding trays) (h) Weight of skirt in steel tonnes (where this is included in the shipping weight of the column it should be so indicated). (j) Weight of trays and if they are fixed. Also weight of tray supports. (k) Thickness in mm of shell and skirt. (l) Total weight in steel tonnes of stairs, ladders catwalks, etc., attached to column. (m) Details of foundation work - other than oversite concrete, including piling, mass and Reinforced Concrete work, pits, chambers other under-ground works. (n) Throughput in gallons or barrels per day or per steam day. (o) Materials used in construction particularly linings (known as cladding on the trade) *Weight calculations to be made as follows: - 1. Shell 2. Heads 3 Internal Plate work 4. Tray supports 5. Insulation rings 6. Openings 7. Nozzles 8 Welds 9. Skirt 10. Base Ring 11 Anchor Ring/Lugs 12. Lifting Davits Weights normally shown on drawings are design weights - actual weight per fabricator may differ slightly

Cost information notes: The tower is under pressure and is therefore a pressure vessel. Fabrication costs are high and site erection costs are more due to the nature of structure.

Rateable element: Class 4 Table 4 - Towers and Columns subject to Class 4(d) limitation

Non-rateable element: Whole if Class 4(d) limitation applies i.e.: - does not exceed less than 400m3 and readily capable of being moved without substantial demolition to the surrounding structure

Adjusted plant and machinery: The item can typically be found on an industrial, commercial or office complex. Some hereditaments may have multiple items, in which case the ERC needs to reflect the number of items.

Number of items adjusted: Steelwork, foundations, settings, platforms, supports, staging Ladders and Platforms Add to the above costs in respect of all columns where details of ladders and platforms are known, see 215N for costs, otherwise add 4% of mild steel equivalent to the cost of each column.

Contract size adjustment: See Appendix BEAMS Note 1

Variations: -

Description: Otherwise known as a column. Crude oil is rarely useable as such and must therefore be refined. This is achieved by distillation - crude oil is heated until it is vaporised and then cooled forming liquids according to the boiling points of their constituent molecules. From Refinery storage tanks crude oil is pumped through horizontal steel tubes arranged on the inside walls and the roof of a furnace (oil is unable to ignite as no air is present in the tubes). The oil with a temperature in excess of 300°C goes from the tubes into the lower part of a tall cylindrical tower COLUMN up to 7.5m diameter x 30.48m high FRACTIONATING TOWER. The vapour floats upwards into the fractionating tower - a tower from which fractions are obtained. The tower is divided into numerous compartments by means of trays. The vapours pass through holes in the trays. The higher the room (area above a tray) the cooler the temperature. As vapours rise they are cooled and liquids are condensed. The hydrocarbon vapours with the highest boiling points cool and condense first on the bottom trays. The most volatile (e.g. petrol) comes off the top as vapour and is separately cooled. The division of crude oil into fractions or distillates is made more exacting by using bubble caps (see sketch). By this method hot vapours passing through the holes in the tray are forced to bubble through cooler liquid, which has already been condensed and collected on the tray. Hot vapours boil off any light hydrocarbons on the tray. There may be a series of towers refining the oil again and again, these are known as "SIDE STRIPPERS". Columns are costed with regard to their weight of steel. The costs reflect the mild steel skirt irrespective of the material used in the column construction. The diameters and heights given are for the column only. The cost includes a mild steel skirt. Any brickwork (usually fire protection) over the metal skirt requires an addition. Add 20% (to include for shapes, formation etc.) to scales. The diameters and heights given are for the column only. Additions should be made for foundations and piles. In calculating the volume for class 4 purposes the skirt should be included.

Referencing details: (a) Number (Refinery serial no) and user i.e. No 1 Crude, 2nd stage distillation etc. (b) Overall height - including skirt. (c) Diameter - in the case of columns of

varying diameters the length diameter of each different section should be given. (d) Height of skirt whether clad or bricked. (e) If lagged - the material used, its thickness and details of outer cover. (f) Operating pressure. (g) Weight of shell steel tonnes (excluding trays) (h) Weight of skirt in steel tonnes (where this is included in the shipping weight of the column it should be so indicated). (j) Weight of trays and if they are fixed. Also weight of tray supports. (k) Thickness in mm of shell and skirt. (l) Total weight in steel tonnes of stairs, ladders catwalks, etc., attached to column. (m) Details of foundation work - other than oversite concrete, including piling, mass and Reinforced Concrete work, pits, chambers other under-ground works. (n) Throughput in gallons or barrels per day or per steam day. (o) Materials used in construction particularly linings (known as cladding on the trade) *Weight calculations to be made as follows: - 1. Shell 2. Heads 3 Internal Plate work 4. Tray supports 5. Insulation rings 6. Openings 7. Nozzles 8 Welds 9. Skirt 10. Base Ring 11 Anchor Ring/Lugs 12. Lifting Davits Weights normally shown on drawings are design weights - actual weight per fabricator may differ slightly

Cost information notes: The tower is under pressure and is therefore a pressure vessel. Fabrication costs are high and site erection costs are more due to the nature of structure.

Rateable element: Class 4 Table 4 - Towers and Columns subject to Class 4(d) limitation

Non-rateable element: Whole if Class 4(d) limitation applies i.e.: - does not exceed less than 400m3 and readily capable of being moved without substantial demolition to the surrounding structure

Adjusted plant and machinery: The item can typically be found on an industrial, commercial or office complex. Some hereditaments may have multiple items, in which case the ERC needs to reflect the number of items.

Number of items adjusted: Steelwork, foundations, settings, platforms, supports, staging Ladders and Platforms Add to the above costs in respect of all columns where details of ladders and platforms are known, see 215N for costs, otherwise add 4% of mild steel equivalent to the cost of each column.

(j) Weight of trays and if they are fixed. Also weight of tray supports. (k) Thickness in mm of shell and skirt. (l) Total weight in steel tonnes of stairs, ladders catwalks, etc., attached to column. (m) Details of foundation work - other than oversite concrete, including piling, mass and Reinforced Concrete work, pits, chambers other under-ground works. (n) Throughput in gallons or barrels per day or per steam day. (o) Materials used in construction particularly linings (known as cladding on the trade) *Weight calculations to be made as follows: - 1. Shell 2. Heads 3 Internal Plate work 4. Tray supports 5. Insulation rings 6. Openings 7. Nozzles 8 Welds 9. Skirt 10. Base Ring 11 Anchor Ring/Lugs 12. Lifting Davits Weights normally shown on drawings are design weights - actual weight per fabricator may differ slightly

Cost information notes: Columns are costed with regard to their weight of steel. The basic steel usually adopted is Carbon Manganese steel however care must be given to the steel Cost Information as more modern columns are often made from high quality specialised steel. This would increase the price/stone (stainless steel and cast iron costs are provided). The Tables assume standard construction plate thickness and materials. In these tables it is assumed the Skirt is metal and welded to the column. It is usually mild steel whatever type of steel forms the main body of the column. The costs reflect the mild steel skirt irrespective of the material used in the column construction. The diameters and heights given are for the column only. Although the ERC include the cost of a mild steel skirt. Any brickwork (usually fire protection) over the metal skirt requires an addition. Add 20% (to include for shapes, formation etc.) to scales. The diameters and heights given are for the column only. Additions should be made for foundations and piles. In calculating the volume for Class 4 purposes the skirt should be included.

Rateable element: Class 4 Table 4 - Towers and Columns subject to Class 4(d) limitation

Non-rateable element: Whole if Class 4(d) limitation applies i.e.: - does not exceed less than 400m3 and readily capable of being moved without substantial demolition to the surrounding structure

Adjusted plant and machinery: Ladders and Platforms Add to the above costs in respect of all columns Where details of ladders and platforms are known, see 215N for costs;

Number of items adjusted: Steelwork, foundations, settings, platforms, supports, staging Ladders and Platforms Add to the above costs in respect of all columns where details of ladders and platforms are known, see 215N for costs, otherwise add 4% of mild steel equivalent to the cost of each column.

Contract size adjustment: See Appendix BEAMS Note 1

Description: Otherwise known as a column. Crude oil is rarely useable as such and must therefore be refined. This is achieved by distillation - crude oil is heated until it is vaporised and then cooled forming liquids according to the boiling points of their constituent molecules. From Refinery storage tanks crude oil is pumped through horizontal steel tubes arranged on the inside walls and the roof of a furnace (oil is unable to ignite as no air is present in the tubes). The oil with a temperature in excess of 300°C goes from the tubes into the lower part of a tall cylindrical tower COLUMN up to 7.5m diameter x 30.48m high FRACTIONATING TOWER. The vapour floats upwards into the fractionating tower - a tower from which fractions are obtained. The tower is divided into numerous compartments by means of trays. The vapours pass through holes in the trays. The higher the room (area above a tray) the cooler the temperature. As vapours rise they are cooled and liquids are condensed. The hydrocarbon vapours with the highest boiling points cool and condense first on the bottom trays. The most volatile (e.g. petrol) comes off the top as vapour and is separately cooled. The division of crude oil into fractions or distillates is made more exacting by using bubble caps (see sketch). By this method hot vapours passing through the holes in the tray are forced to bubble through cooler liquid, which has already been condensed and collected on the tray. Hot vapours boil off any light hydrocarbons on the tray. There may be a series of towers refining the oil again and again, these are known as "SIDE STRIPPERS". Columns are costed with regard to their weight of steel. The costs reflect the mild steel skirt irrespective of the material used in the column construction. The diameters and heights given are for the column only. The cost includes a mild steel skirt. Any brickwork (usually fire protection) over the metal skirt requires an addition. In calculating the volume for class 4 purposes the skirt should be included.

Referencing details: (a) Number (Refinery serial no) and user i.e. No 1 Crude, 2nd stage distillation etc. (b) Overall height - including skirt. (c) Diameter - in the case of columns of

varying diameters the length diameter of each different section should be given. (d) Height of skirt whether clad or bricked. (e) If lagged - the material used, its thickness and details of outer cover. (f) Operating pressure. (g) Weight of shell steel tonnes (excluding trays) (h) Weight of skirt in steel tonnes (where this is included in the shipping weight of the column it should be so indicated). (j) Weight of trays and if they are fixed. Also weight of tray supports. (k) Thickness in mm of shell and skirt. (l) Total weight in steel tonnes of stairs, ladders catwalks, etc., attached to column. (m) Details of foundation work - other than oversite concrete, including piling, mass and Reinforced Concrete work, pits, chambers other under-ground works. (n) Throughput in gallons or barrels per day or per steam day. (o) Materials used in construction particularly linings (known as cladding on the trade) *Weight calculations to be made as follows: - 1. Shell 2. Heads 3 Internal Plate work 4. Tray supports 5. Insulation rings 6. Openings 7. Nozzles 8 Welds 9. Skirt 10. Base Ring 11 Anchor Ring/Lugs 12. Lifting Davits Weights normally shown on drawings are design weights - actual weight per fabricator may differ slightly

Cost information notes: Columns are costed with regard to their weight of steel. The basic steel usually adopted is Carbon Manganese steel however care must be given to the steel Cost Information as more modern columns are often made from high quality specialised steel. This would increase the price/stone (stainless steel and cast iron costs are provided). The Tables assume standard construction plate thickness and materials. In these tables it is assumed the Skirt is metal and welded to the column. It is usually mild steel whatever type of steel forms the main body of the column. The costs reflect the mild steel skirt irrespective of the material used in the column construction. The diameters and heights given are for the column only. Although the ERC include the cost of a mild steel skirt. Any brickwork (usually fire protection) over the metal skirt requires an addition. Add 20% (to include for shapes, formation etc.) to scales. The diameters and heights given are for the column only. Additions should be made for foundations and piles. In calculating the volume for Class 4 purposes the skirt should be included.

Rateable element: Class 4 Table 4 - Towers and Columns subject to Class 4(d) limitation

Non-rateable element: Whole if Class 4(d) limitation applies i.e.: - does not exceed less than 400m3 and readily capable of being moved without substantial demolition to the surrounding structure

Adjusted plant and machinery: Ladders and Platforms Add to the above costs in respect of all columns Where details of ladders and platforms are known, see 215N for costs;

Number of items adjusted: Steelwork, foundations, settings, platforms, supports, staging Ladders and Platforms Add to the above costs in respect of all columns where details of ladders and platforms are known, see 215N for costs, otherwise add 4% of mild steel equivalent to the cost of each column.

Contract size adjustment: See Appendix BEAMS Note 1

Description: Otherwise known as a column. Crude oil is rarely useable as such and must therefore be refined. This is achieved by distillation - crude oil is heated until it is vaporised and then cooled forming liquids according to the boiling points of their constituent molecules. From Refinery storage tanks crude oil is pumped through horizontal steel tubes arranged on the inside walls and the roof of a furnace (oil is unable to ignite as no air is present in the tubes). The oil with a temperature in excess of 300°C goes from the tubes into the lower part of a tall cylindrical tower COLUMN up to 7.5m diameter x 30.48m high FRACTIONATING TOWER. The vapour floats upwards into the fractionating tower - a tower from which fractions are obtained. The tower is divided into numerous compartments by means of trays. The vapours pass through holes in the trays. The higher the room (area above a tray) the cooler the temperature. As vapours rise they are cooled and liquids are condensed. The hydrocarbon vapours with the highest boiling points cool and condense first on the bottom trays. The most volatile (e.g. petrol) comes off the top as vapour and is separately cooled. The division of crude oil into fractions or distillates is made more exacting by using bubble caps (see sketch). By this method hot vapours passing through the holes in the tray are forced to bubble through cooler liquid, which has already been condensed and collected on the tray. Hot vapours boil off any light hydrocarbons on the tray. There may be a series of towers refining the oil again and again, these are known as "SIDE STRIPPERS". Columns are costed with regard to their weight of steel. The costs reflect the mild steel skirt irrespective of the material used in the column construction. The diameters and heights given are for the column only. The cost includes a mild steel skirt. Any brickwork (usually fire protection) over the metal skirt requires an addition. Unit of measurement: Each

ERC: £8,545,266

Superseded codes: -

Location factor: Considered Not Applicable at time of Publication

Description: Otherwise known as a column. Crude oil is rarely useable as such and must therefore be refined. This is achieved by distillation - crude oil is heated until it is vaporised and then cooled forming liquids according to the boiling points of their constituent molecules. From Refinery storage tanks crude oil is pumped through horizontal steel tubes arranged on the inside walls and the roof of a furnace (oil is unable to ignite as no air is present in the tubes). The oil with a temperature in excess of 300°C goes from the tubes into the lower part of a tall cylindrical tower COLUMN up to 7.5m diameter x 30.48m high FRACTIONATING TOWER. The vapour floats upwards into the fractionating tower - a tower from which fractions are obtained. The tower is divided into numerous compartments by means of trays. The vapours pass through holes in the trays. The higher the room (area above a tray) the cooler the temperature. As vapours rise they are cooled and liquids are condensed. The hydrocarbon vapours with the highest boiling points cool and condense first on the bottom trays. The most volatile (e.g. petrol) comes off the top as vapour and is separately cooled. The division of crude oil into fractions or distillates is made more exacting by using bubble caps (see sketch). By this method hot vapours passing through the holes in the tray are forced to bubble through cooler liquid, which has already been condensed and collected on the tray. Hot vapours boil off any light hydrocarbons on the tray. There may be a series of towers refining the oil again and again, these are known as "SIDE STRIPPERS". Columns are costed with regard to their weight of steel. The costs reflect the mild steel skirt irrespective of the material used in the column construction. The diameters and heights given are for the column only. The cost includes a mild steel skirt. Any brickwork (usually fire protection) over the metal skirt requires an addition. Add 20% (to include for shapes, formation etc.) to scales. The diameters and heights given are for the column only. Additions should be made for foundations and piles. In calculating the volume for class 4 purposes the skirt should be included.

Referencing details: 1. Shell 2. Heads 3 Internal Plate work 4. Tray supports 5. Insulation rings 6. Openings 7. Nozzles 8 Welds 9. Skirt 10. Base Ring 11 Anchor Ring/Lugs 12. Lifting

Davits Weights normally shown on drawings are design weights - actual weight per fabricator may differ slightly.

Cost information notes: Columns are costed with regard to their weight of steel. The basic steel usually adopted is Carbon Manganese steel however care must be given to the steel Cost Information as more modern columns are often made from high quality specialised steel. This would increase the price/stone (stainless steel and cast iron costs are provided). The Tables assume standard construction plate thickness and materials. In these tables it is assumed the Skirt is metal and welded to the column. It is usually mild steel whatever type of steel forms the main body of the column. The costs reflect the mild steel skirt irrespective of the material used in the column construction. The diameters and heights given are for the column only. Although the ERC include the cost of a mild steel skirt. Any brickwork (usually fire protection) over the metal skirt requires an addition. Add 20% (to include for shapes, formation etc.) to scales. The diameters and heights given are for the column only. Additions should be made for foundations and piles. In calculating the volume for Class 4 purposes the skirt should be included.

Rateable element: Class 4 Table 4 - Towers and Columns subject to Class 4(d) limitation

Refining

CG Code: 213C01

Specific: Gas Process

Descriptive: Slug catcher

Tech 1: -

Tech 2: -

Unit size: linear metre

Unit of measurement: m

ERC: £3,465

Superseded codes: -

Location factor: Considered Not Applicable at time of Publication

Description: A complex pressure vessel known as a slug catcher, which separates gas, condensate and water, which has arrived from the oilfield beneath the sea or land. The incoming material is under pressures of over 1000 psig. The vessels are manufactured either from bent welded steel plate in tubular form or in the form of drop tanks (pressure vessels). The tubular construction can have sections of between 250 mm to 1 metre and the wall thickness can vary between 25 mm to 75 mm. Drop tanks consist of 3 - 4 tanks lying under an initial receiving tank. A Slug catcher is the structure of interconnected tubular steel pieces made to withstand pressure and intercept slugs of liquid contained within a pipeline and separate out from the gas stream. In gas lines from offshore and onshore wells, petroleum liquids (condensate) accumulate by dropping out or condensing and collecting in low sections in the line. When enough condensate (and water) collects the flow of gas is disturbed and the restricted volatile gas starts to change back into liquid causing more slugs to build up. At this point a "pig" is sent down the pipe to collect all the slugs together and it is this large build up of liquid that a slug catcher primarily separates into gas, water and condensate. A Slug is a compact mass of liquid, retaining its identity as it travels. The collection of liquid forming a large slug can amount to several thousand gallons and can travel along a pipe at up to 10 mph. When the slug arrives at the slug catcher consisting of condensate, Gas, and water all-in a volatile state.

Referencing details: Length taken from the inlet manifold to the main gas off-take pipe: the cost per linear metre has been derived after consideration of all of the different diameters and wall thickness.

Cost information notes: -

Rateable element: Class 4 Table 4 (tubular) separator Class 4 table 4 (drop tank) tank / separator Machine to sort or divide into parts or sizes

Non-rateable element: Instruments and controls. Exclude pipes taking gas / condensate from the slug catcher If Class 4 (d) is applicable

CG Code: 33U195

Specific: Surfaces

Descriptive: Asphalt includes excavation and base

Tech 1: 30mm thick

Tech 2: 530mm overall thickness

Unit size: -

Unit of measurement: m2

ERC: £111

Superseded codes: -

Location factor: Location Adjustment Applicable (See Guidance Notes) - ERC = UK mean of 1.00

Description: 300mm compacted sub-base blinded with sand, with 100mm dense bitumen base course over, with 60mm base course and 40mm wearing asphalt course. Includes excavation, but excludes drainage.

Referencing details: -

Cost information notes: -

Rateable element: -

Non-rateable element: -

Adjusted plant and machinery: -

Number of items adjusted: -

Contract size adjustment: See Appendix BEAMS Note 2

Variations: -

Roads

CG Code: 33U1A5

Specific: Surfaces

Descriptive: Hardcore includes excavation

Tech 1: 150mm thick

Tech 2: -

Unit size: m2

Unit of measurement: m2

ERC: £19

Superseded codes: -

Location factor: Location Adjustment Applicable (See Guidance Notes) - ERC = UK mean of 1.00

Description: Compacted 150mm hardcore base layer compacted and blinded with sand Includes excavation, but excludes drainage.

Referencing details: -

Cost information notes: -

Rateable element: -

Non-rateable element: -

Adjusted plant and machinery: -

Number of items adjusted: -

Contract size adjustment: See Appendix BEAMS Note 2

Variations: -

Roads

CG Code: 33U1AF

Specific: Surfaces

Descriptive: Gravel includes excavation and base

Tech 1: 50mm thick

Tech 2: Overall thickness 250mm

Unit size: -

Unit of measurement: m2

ERC: £28

Superseded codes: -

Location factor: Location Adjustment Applicable (See Guidance Notes) - ERC = UK mean of 1.00

Description: 150mm Hardcore base layer compacted and blinded with 50mm sand. Includes excavation, but excludes drainage.

Referencing details: -

Cost information notes: -

Rateable element: -

Non-rateable element: -

Adjusted plant and machinery: -

Number of items adjusted: -

Contract size adjustment: See Appendix BEAMS Note 2

Variations: -

Roads

CG Code: 33U1AK

Specific: Surfaces

Descriptive: Gravel includes excavation and base

Tech 1: 63mm thick

Tech 2: Overall thickness 263mm

Unit size: -

Unit of measurement: m2

ERC: £30

Superseded codes: -

Location factor: Location Adjustment Applicable (See Guidance Notes) - ERC = UK mean of 1.00

Description: 150mm Hardcore base layer compacted and blinded with 50mm sand, with 63mm gravel over a terram membrane. Includes excavation, but excludes drainage.

Referencing details: -

Cost information notes: -

Rateable element: -

Non-rateable element: -

Adjusted plant and machinery: -

Number of items adjusted: -

Contract size adjustment: See Appendix BEAMS Note 2

Variations: -

Roads

CG Code: 33U1AQ

Specific: Surfaces

Descriptive: Granular Rock includes excavation

Tech 1: 100mm thick

Tech 2: Overall thickness 100mm

Unit size: -

Unit of measurement: m2

ERC: £16

Superseded codes: -

Location factor: Location Adjustment Applicable (See Guidance Notes) - ERC = UK mean of 1.00

Description: Compacted 100mm Granular Rock base layer compacted and blinded with sand Includes excavation, but excludes drainage.

Referencing details: -

Cost information notes: -

Rateable element: -

Non-rateable element: -

Adjusted plant and machinery: -

Number of items adjusted: -

Contract size adjustment: See Appendix BEAMS Note 2

Variations: -

Roads

CG Code: 33U1F5

Specific: Surfaces

Descriptive: Artificial Stone Flags includes excavation and base

Tech 1: 450mm x 450mm x 50mm thick

Tech 2: -

Unit size: -

Unit of measurement: m2

ERC: £61

Superseded codes: -

Location factor: Location Adjustment Applicable (See Guidance Notes) - ERC = UK mean of 1.00

Description: Overall 275mm thick. 150mm hardcore base layer compacted and blinded with sand, flags laid in sand and cement mortar. Includes excavation, but excludes drainage.

Referencing details: -

Cost information notes: -

Rateable element: -

Non-rateable element: -

Adjusted plant and machinery: -

Number of items adjusted: -

Contract size adjustment: See Appendix BEAMS Note 2

Unit size: -

Unit of measurement: Each

ERC: £8,533

Superseded codes: -

Location factor: Location Adjustment Applicable (See Guidance Notes) - ERC = UK mean of 1.00

Description: 4m electrically operated lifting arm, pedestal mounted card reader and auto close induction loop on entrance and exit, over ride switch. Includes concrete foundations and electrical connections

Referencing details: -

Cost information notes: -

Rateable element: -

Non-rateable element: -

Adjusted plant and machinery: -

Number of items adjusted: -

Contract size adjustment: See Appendix BEAMS Note 2

Variations: -

Roads

CG Code: 33U1VJ

Specific: Vehicle barriers

Descriptive: Access control

Tech 1: 3m wide hydraulic blocker

Tech 2: 350mm high

Unit size: -

Unit of measurement: Each

ERC: £11,614

Superseded codes: -

Location factor: Location Adjustment Applicable (See Guidance Notes) - ERC = UK mean of 1.00

Description: 3m wide hydraulic road blocker, with 350mmm raised height. Remote push button control, 2 induction loops and traffic lights. Includes all foundations and electrical connections

Referencing details: -

Cost information notes: -

Rateable element: -

Non-rateable element: -

Adjusted plant and machinery: -

Description: Steel roof trusses and beams. A pitched roof is a form of ridge roof sloping down in two directions from a central apex or ridge as it is technically called. A steel trussed roof structure comprises multiple structural members including rafters, struts and ties welded or mechanically bolted together to form a triangulated structure commonly known as a roof truss. Steel roof trusses provide a frame on which to clad both slopes with a weather proof sheet or tile covering.

Location factor: Location Adjustment Applicable (See Guidance Notes) - ERC = UK mean of 1.00

Description: Flat or low-sloping roof often surfaced with alternating layers of roofing felt known as built-up, or tar-and-gravel roof. Felt flat roofing systems are made from a build up of several layers of roofing felt. These layers are usually bound together with molten liquid bitumen. Cold bonding agents are sometimes used. The methods of fixing are usually referred as roll and pour or torchon. To protect the felt from the effects of solar radiation the top layer has a mineral coating, fine stone chips often light green in colour.

Description: Concrete roof tiles provide a waterproof covering to pitched roofs. Comprised of manufactured units designed to overlap each other at the sides as well as the top to help avoid wind blown rain entering the building, they are hung on horizontal timber battens. Usually a felt underlay is also installed, below the battens. This is a common roofing material for domestic properties, available in a variety of colours and different profiles to suit different architectural styles.

Location factor: Location Adjustment Applicable (See Guidance Notes) - ERC = UK mean of 1.00

Description: Roof tiles are made from either concrete or clay and are hung on and nailed to the batten below. Types of tile: Standard - double lap - plain tiles. Eaves or top course tile. Tile and a half tile. Half round ridge tile. Curve valley tile. Bonnet hip tile. Double lap tiles are the traditional tiles used on pitched roofs. Slate roof tiles are formed from slate, a natural and dense material that is split into thin sheets and cut into small units to attach to pitched roofs.

Description: Roof coverings to pitched roofs: Roof Tiles Plain are made from either concrete or clay and are hung on and nailed to the batten below. They are installed, double lap so that a tile is located beneath the abutting gap of the tiles above to prevent internal water ingress. Plain clay tiles are sometimes referred to as rosemary tiles.

Tech 1: Asbestos free artificial slates

Tech 2: Fibre cement

Unit size: -

Unit of measurement: m2

ERC: £38

Superseded codes: -

Location factor: Location Adjustment Applicable (See Guidance Notes) - ERC = UK mean of 1.00

Description: These are man made manufactured slates designed to replicate the aesthetics of natural slates but at a lower cost. Traditionally they were made with asbestos but now made with alternative man made fibres in order to provide strength and thin artificial slates. Generally coloured dark grey or black, individual slates have a uniform look and shape. With age exposure to solar radiation their colour lightens. They are fixed with clips or nails to treated timber battens.

Referencing details: Measure to roof area =m2 when practicable - Age and condition.

Cost information notes: Cost includes treated battens and fixing and standard felt underlay to the roof slopes.

Unit of measurement: Each

ERC: £2,244

Superseded codes: -

Location factor: Location Adjustment Applicable (See Guidance Notes) - ERC = UK mean of 1.00

Description: A security system comprising four or more cameras, which are linked to a central monitoring, control and recording area. Cameras can be found both internally and externally within factory or commercial hereditaments. Where more than four cameras are employed either large split screens or multiple screens are usually used for monitoring. Recording is now generally on a computer hard drive or DVD / CD-ROM. Systems can form part of an integrated security / observation operation and the pre amble to Class 2 should be studied. (See rateable and non-rateable elements)

Referencing details: It is not intended to rate isolated cameras. A system comprises four or more cameras. The number of cameras should be recorded. CCTV systems for traffic or shopping mall security should not be rated.

Cost information notes: System comprises: - camera, lense, mounting brackets, housing, cabling back to monitoring station, control / recording equipment and display monitors. Installers do not manufacture the equipment but assemble the various component parts to form a bespoke system. There is no additional discount for additional cameras. Total system cost should be built up using listed component costs.

Rateable element: Class 2 Table 2 (f) PROTECTION FORM HAZARDS security and alarm systems together with list of accessories 2(i), (v), (vii), (viii)

Non-rateable element: -

Security and Alarm Systems

CG Code: 208S03

Specific: Security Camera Systems

Descriptive: Industrial 'Robust' system

Tech 1: In terms of each unit

Tech 2: Multiplexer and telemetry receiver (b & w)

Unit size: Each

Unit of measurement: Each

ERC: £2,946

Superseded codes: -

Location factor: Location Adjustment Applicable (See Guidance Notes) - ERC = UK mean of 1.00

Description: A security system comprising four or more cameras, which are linked to a central monitoring, control and recording area. Cameras can be found both internally and externally within factory or commercial hereditaments. Where more than four cameras are employed either large split screens or multiple screens are usually used for monitoring. Recording is now generally on a computer hard drive or DVD / CD-ROM. Systems can form part of an integrated security / observation operation and the pre amble to Class 2 should be studied. (See rateable and non-rateable elements)

Referencing details: It is not intended to rate isolated cameras. A system comprises four or more cameras. The number of cameras should be recorded. CCTV systems for traffic or shopping mall security should not be rated.

Cost information notes: System comprises: - camera, lense, mounting brackets, housing, cabling back to monitoring station, control / recording equipment and display monitors. Installers do not manufacture the equipment but assemble the various component parts to form a bespoke system. There is no additional discount for additional cameras. Total system cost should be built up using listed component costs.

Rateable element: Class 2 Table 2 (f) PROTECTION FORM HAZARDS security and alarm systems together with list of accessories 2(i), (v), (vii), (viii)

Non-rateable element: -

Adjusted plant and machinery: Supporting structures (other than mounting brackets that are included in the cost), foundations, security fences, gates, barriers.

Security and Alarm Systems

CG Code: 33UEL2

Specific: Microwave system

Descriptive: Perimeter - line of sight

Tech 1: Post mounted transmitters and receivers

Tech 2: -

Unit size: m

Unit of measurement: m

ERC: £91

Superseded codes: -

Location factor: Considered Not Applicable at time of Publication

Description: Series of posts with receiver/transmitter devices which create an un-broken ring of protection. Interruption of the beam will trigger alarm warnings to control centre. Posts set up at changes in direction or level. Often installed, in commercially sensitive installations. May be sited inside or between fencing on cleared ground. May be interconnected to other alarm systems.

Referencing details: Measure length of boundary protected in metres

Cost information notes: Includes cost of posts, all wiring connection and transmitters, receiver devices plus links to control centre.

Description: Reinforced concrete tank with base normally set below ground and the outer wall above ground level. Used for the bacteriological treatment of sewage by mechanical agitators. There is usually a safety rail to the top of the wall.

Referencing details: Gross internal Volume (GIV) m3

Cost information notes: Costs are to include the supporting structure (often concrete) for the agitators which will often double up as walkways (handrails to be included). Costs are to exclude any mechanical plant, including the agitators and motors.

Rateable element: Class 4 Table 4 Tanks See Paragraphs under Rateable element in sewage works: Definitions and Referencing Aids.

Non-rateable element: Class 4(d) does not exceed 400 cubic metres total cubic capacity (measured EXTERNALLY and EXCLUDING foundations, settings, supports, and anything, which is not an integral part of the item).and which is readily capable of being moved from one site and re-erected in its original state on another without substantial demolition of any surrounding structure. In reality most concrete tanks under 400 cubic metres either above ground or below will not be capable of moving and re-erecting in its original state and thus are rateable. Most metal tanks under 400 cubic metres will be non-rateable.

Superseded codes: -

Location factor: Location Adjustment Applicable (See Guidance Notes) - ERC = UK mean of 1.00

Description: Used to elevate effluent to a greater height thereby invoking a stronger gravity flow for further stages of treatment. Within the screw house there is normally one chamber in which the bottom end of the screw(s) rest and a further chamber at the top of the screw(s) to receive the elevated effluent. The screws sit in an inclined conduit. There is normally a protective grille over the screw(s). The motor mechanism powering the screw(s) is sometimes located within a housing structure at the top of the screw chamber.

Referencing details: Gross Internal Volume of the whole structure

Cost information notes: The costs include the chambers, the screw pumps and the channel they reside within, screws, protective grills and handrails, the costs do not include the buildings, staircases or any other elements. i.e. meica

Description: Used to elevate effluent to a greater height thereby invoking a stronger gravity flow for further stages of treatment. Within the screw house there is normally one chamber in which the bottom end of the screw(s) rest and a further chamber at the top of the screw(s) to receive the elevated effluent. The screws sit in an inclined conduit. There is normally a protective grille over the screw(s). The motor mechanism powering the screw(s) is sometimes located within a housing structure at the top of the screw chamber.

Referencing details: Gross Internal Volume of the whole structure

Cost information notes: The costs include the chambers, the screw pumps and the channel they reside within, screws, protective grills and handrails, the costs do not include the buildings, staircases or any other elements. i.e. meica

Sewage treatment works

CG Code: 63M0C1

Specific: Bacteria beds

Descriptive: Circular

Tech 1: Over 5.0m - 10.0m diameter

Tech 2: -

Unit size: -

Unit of measurement: m3

ERC: £616

Superseded codes: -

Location factor: Location Adjustment Applicable (See Guidance Notes) - ERC = UK mean of 1.00

Description: Generally circular, (but may be octagonal) reinforced concrete tank usually some 1 metre high with slightly sloping base, which is set at or just below ground level. Tank filled with media which is often in the form of large stone pieces. The intention is to increase the surface area over which the effluent (dirty water) is spread in order that bacteriological action can take place. In certain locations some tanks have stonewalls.

Referencing details: Gross internal Volume (GIV) m3. However, reference is also made to the diameter of the tank

Cost information notes: The costs should exclude the media and any mechanical plant (rotating arm, pumps, and motors etc).

Tech 1: Without base

Tech 2: -

Unit size: -

Unit of measurement: m3

ERC: £27

Superseded codes: -

Location factor: Location Adjustment Applicable (See Guidance Notes) - ERC = UK mean of 1.00

Description: This unit is constructed of Glass Reinforced Plastic (GRP). The unit has within it a moving part (usually a disk), which is impregnated with biological organisms. When the surface of this moving part comes into contact with the effluent within the unit, the organisms on the moving part interact with and neutralise many of the harmful bacteria in the effluent. Bio Disk units are used both as part of the treatment process in medium to small works, and often as a self-contained treatment process for single dwellings or for small works. These units are generally sunk into the ground, but this is not always the case. Where a unit is sunk into the ground there may be a concrete foundation underneath the unit if the load bearing capacity of the soil is not sufficient. The gap between the unit and the pit wall is then backfilled with either concrete or pea shingle. Where the ground has a particularly high-water table level the Bio Disk Unit may be set within its own concrete pit. Similar- Submerged aeration filters (SAF plants) and other similar GRP units will also be set into the ground.

Referencing details: Gross internal Volume (GIV) m3

Cost information notes: Costs in for all these items are to exclude the provision of handrails, access stairs or internal walls. They are also to exclude the mechanical plant including the disk itself and any motors.

Location factor: Location Adjustment Applicable (See Guidance Notes) - ERC = UK mean of 1.00

Description: The double membrane biogas storage tank has been developed for low-pressure dry gas storage. The outer membrane is made from polyester fabrics with special PVC surface treatment and acrylate finish and has strengthening bands where each panel is welded to the next. The inner tank, which is more flexible than the outer, consists of a bottom membrane sealed to an inner membrane. There are pipes built into the concrete foundations, which are sealed where they pass through the bottom membrane. These are for gas supply and discharge. A separate pipe is installed, for condensation discharge. The tank is anchored to the reinforced concrete foundation by an anchorage ring, which is cast into the slab and sealed to the bottom membrane.

Referencing details: Gross Volume m3 of the sphere.

Cost information notes: Costs include excavation, construction of a tank base, anchor ring, collar, and pipe connections for the storage tank only. Costs exclude foundations associated with condensate chambers, lightning protection, surrounding paving, interconnecting pipework between gas holding tank and any other equipment outside of the perimeter of the tank.

Description: The double membrane biogas storage tank has been developed for low-pressure dry gas storage. The outer membrane is made from polyester fabrics with special PVC surface treatment and acrylate finish and has strengthening bands where each panel is welded to the next. The inner tank, which is more flexible than the outer, consists of a bottom membrane sealed to an inner membrane. There are pipes built into the concrete foundations, which are sealed where they pass through the bottom membrane. These are for gas supply and discharge. A separate pipe is installed, for condensation discharge. The tank is anchored to the reinforced concrete foundation by an anchorage ring, which is cast into the slab and sealed to the bottom membrane.

Referencing details: Gross Volume m3 of the sphere.

Cost information notes: Costs include excavation, construction of a tank base, anchor ring, collar, and pipe connections for the storage tank only. Costs exclude foundations associated with condensate chambers, lightning protection, surrounding paving, interconnecting pipework between gas holding tank and any other equipment outside of the perimeter of the tank.

Location factor: Location Adjustment Applicable (See Guidance Notes) - ERC = UK mean of 1.00

Description: Reinforced concrete chambers normally set below ground. May contain internal concrete walls or half walls however some are situated where pipes/conduits meet and are free of internal walls. Perimeter walls may project above ground by some 300mm. Walls usually 250mm thick.

Referencing details: Gross internal Volume (GIV) m3

Cost information notes: The costs should include an element for a safety rail typically 1200mm high with uprights every 1500mm. The steel being galvanised and 60mm tubular. Manhole types may well have a metal cover. For larger chambers walkways, platforms often covering entire open area of chamber are to be excluded from the cost.

Sewage treatment works

CG Code: 63M0G1

Specific: Conduits - open topped channels

Descriptive: Concrete walls and base

Tech 1: Cross section area of conduit or flume

Tech 2: <= 1m²/linear metre

Unit size: -

Unit of measurement: m2

ERC: £496

Superseded codes: -

Location factor: Location Adjustment Applicable (See Guidance Notes) - ERC = UK mean of 1.00

Description: Conduits are of reinforced concrete construction either situated above or below ground level usually having an open top. They are laid flat or to falls. The conduit varies in width and depth depending on the flow of liquids at that part of the process however it is unusual for the depth to be greater than 1.0m. The width normally is in the range 300mm to 3.0m but can be up to 10.0m. They are usually rectangular in section, with the height greater than the width. Includes all associated works to supply, construct a concrete conduit (Channel) consisting of walls, bases, foundations.

Referencing details: Costed on a rate m2

Cost information notes: Excludes access arrangements, piling and/or any other element not described above. The cost is to exclude, any handrails or safety fencing built onto the conduit.

Location factor: Location Adjustment Applicable (See Guidance Notes) - ERC = UK mean of 1.00

Description: These normally consist of a square tank with the base comprising of an inverted pyramid. They are normally made of reinforced concrete and used for settlement. Tanks normally set below ground with an up stand topped with a safety rail. Cost includes up stand and safety rail. The gross internal volume includes the volume of the weir.

Referencing details: Gross internal Volume (GIV) m3

Cost information notes: Additional cost should be added for handrails, walkways, elevated tanks or conduits, supporting concrete structure and foundations using rates for reinforced concrete beams and columns (Category: Frames: Reinforced Concrete, Foundations: Isolated Bases Item: Concrete - Reinforced).

Rateable element: Class 4 Table 4 Tanks

Non-rateable element: Class 4(d) does not exceed 400 cubic metres total cubic capacity (measured EXTERNALLY and EXCLUDING foundations, settings, supports, and anything, which is not an integral part of the item).and which is readily capable of being moved from one site and re-erected in its original state on another without substantial demolition of any surrounding structure. In reality most concrete tanks under 400 cubic metres either above ground or below will not be capable of moving and re-erecting in its original state and thus are rateable. Most metal tanks under 400 cubic metres will be non-rateable.

Adjusted plant and machinery: Security lighting, walkways.

Sewage treatment works

CG Code: 63M1E2

Specific: GRP covers

Descriptive: To tanks and chambers

Tech 1: Glass reinforced plastic (GRP)

Tech 2: Up to 50m2

Unit size: -

Unit of measurement: m2

ERC: £493

Superseded codes: 63M1E1

Location factor: Location Adjustment Applicable (See Guidance Notes) - ERC = UK mean of 1.00

Description: Covers are frequently made of Glass Reinforced Plastic. The covers will normally be brought to site in sections and then bolted together. The covers are also bolted in place over the tanks, being a permanent feature of the works and are not designed to be removed in the normal operational process.

Referencing details: -

Cost information notes: Area of cover in m2

Rateable element: Covers may be rateable as part of the tank over which they sit. Tanks are a named item under Class 4 Table 4. Under Class 4 (b) covers will only be rateable if they form an integral part of the tank over which they are situated. Deciding if a cover is an integral part of a tank is a question that will need to be resolved in each separate case. Factors that point to the cover being an integral part of the tank are: a strong degree of fixation between the cover and the tank; the cover is a substantial structure in its own right; the cover cannot easily be removed; the cover is seldom if ever removed and the cover is designed to be in place during normal operating conditions. Odour control is a feature of the works on which the covered tank(s) are found.

Description: Moulded Glass Reinforced Plastic (GRP) conical settlement tanks. GRP construction with corrosion resistant reinforcement specifically selected for sewage and wastewater applications. Usually formed from a series of flanged sections which are bolted together and have a non-biodegradable sealant sandwiched between the flanges. Units of 2.5 to 3 metre diameter are usually delivered to site completely assembled, whilst larger units (up to 7 metre diameter) are usually delivered in sections and assembled on-site. Available with 55º (shallow excavation) or 60º cone. Used as primary, final or storm settlement tanks. The tanks are designed and usually installed, below ground, although there is the option of above ground installation (mounted on a galvanised steel frame). The general design and construction is such that the completed tank will withstand both internal and external pressures and will only require a lean-mix concrete surround to eliminate pressure points on the tank skin and provide additional mass to compensate for high ground water table conditions. The lower portion of the tank is usually anchored to a concrete base slab and will also usually have a base frame to provide an anchor and levelling facility. Once the other sections of the tank are positioned, fixed, sealed, and bonded the tank is ready for backfilling.

Referencing details: Gross internal Volume (GIV) m3

Cost information notes: The costs should exclude handrails, bridges and mechanical handling equipment.

Available with 55º (shallow excavation) or 60º cone. Used as primary, final or storm settlement tanks. The tanks are designed and usually installed, below ground, although there is the option of above ground installation (mounted on a galvanised steel frame). The general design and construction is such that the completed tank will withstand both internal and external pressures and will only require a lean-mix concrete surround to eliminate pressure points on the tank skin and provide additional mass to compensate for high ground water table conditions. The lower portion of the tank is usually anchored to a concrete base slab and will also usually have a base frame to provide an anchor and levelling facility. Once the other sections of the tank are positioned, fixed, sealed, and bonded the tank is ready for backfilling.

Referencing details: Gross internal Volume (GIV) m3

Cost information notes: The costs should exclude handrails, bridges and mechanical handling equipment.

Description: Moulded Glass Reinforced Plastic (GRP) conical settlement tanks. GRP construction with corrosion resistant reinforcement specifically selected for sewage and wastewater applications. Usually formed from a series of flanged sections which are bolted together and have a non-biodegradable sealant sandwiched between the flanges. Units of 2.5 to 3 metre diameter are usually delivered to site completely assembled, whilst larger units (up to 7 metre diameter) are usually delivered in sections and assembled on-site. Available with 55º (shallow excavation) or 60º cone. Used as primary, final or storm settlement tanks. The tanks are designed and usually installed, below ground, although there is the option of above ground installation (mounted on a galvanised steel frame). The general design and construction is such that the completed tank will withstand both internal and external pressures and will only require a lean-mix concrete surround to eliminate pressure points on the tank skin and provide additional mass to compensate for high ground water table conditions. The lower portion of the tank is usually anchored to a concrete base slab and will also usually have a base frame to provide an anchor and levelling facility. Tech 2: -

Unit size: -

Unit of measurement: m2

ERC: £81

Superseded codes: -

Location factor: Location Adjustment Applicable (See Guidance Notes) - ERC = UK mean of 1.00

Description: Reed beds are formed by excavating an area of land, lining the excavation (usually with butyl), then covering it with soil. Carefully selected reeds are then planted within the topsoil. Effluent flows into the bed and allowed to remain there for a period of time, during which organisms that naturally occur within the roots of the reeds have the effect of neutralising harmful bacteria found within the effluent.

Referencing details: Area of bed m2

Cost information notes: Rate excludes adjacent structures, chambers or gabions, paths and walls. Rate also excludes brick or concrete walling to the bed itself.

Rateable element: Class 4 Table 3 Beds (It is the lined bed that is rateable)

Non-rateable element: The reeds themselves are not rateable nor is the medium filling the beds.

Adjusted plant and machinery: Chambers, Conduits, Security lighting.

Contract size adjustment: See Appendix BEAMS Note 2

Variations: -

Sewage treatment works

CG Code: 63M0E1

Specific: Sedimentation or Humus Tanks - Circular

Descriptive: Circular tanks

Tech 1: Reinforced concrete

Tech 2: 100.0m³ - 250.0m³

Unit size: -

Unit of measurement: m3

ERC: £505

Superseded codes: -

Location factor: Location Adjustment Applicable (See Guidance Notes) - ERC = UK mean of 1.00

Description: A circular reinforced concrete sedimentation tank consisting of a central well, a sloping cone, vertical walls, and an outer weir. The angle of the sloping cone is usually 7.5 degrees or 10 degrees occasionally up to 30 degrees to the horizontal and allows for the settlement of sludge in the central bottom cone. The tank is normally set below the ground with an up stand topped with a safety rail. Cost includes up stand and safety rail. The cost excludes the bridge/ walkway and any mechanical equipment. The gross internal volume includes the volume of the weir.

Referencing details: Referencing of these items is very difficult and NO attempt must be made to climb on the surrounding apparatus in order to establish depths of the cylinder, cone or sump. Ask for suitable plans and take all of the measurements from them. Calculate GIV = m3. The calculation only includes part of the volume of the sump/pit, however, as the volume of the residue of the sump is relatively small the difference may be disregarded. The total diameter should include the weir.

Cost information notes: For cost purposes the rate provided is in terms of Gross Internal Volume however for calculation of the volume of the tank for rateability regard is to be given to the total cubic capacity in accordance with Class 4(d) (measured externally and excluding foundations, settings, supports, and anything, which is not an integral part of the item).

Rateable element: Class 4 Table 4 Tanks. Class 4 Table 3 Bridges, Walkways

Non-rateable element: Class 4(d) does not exceed 400 cubic metres total cubic capacity (measured EXTERNALLY and EXCLUDING foundations, settings, supports, and anything, which is not an integral part of the item).and which is readily capable of being moved from one site and re-erected in its original state on another without substantial demolition of any surrounding structure. In reality most concrete tanks under 400 cubic metres either above

ground or below will not be capable of moving and re-erecting in its original state and thus are rateable. Most metal tanks under 400 cubic metres will be non-rateable.

Adjusted plant and machinery: Security lighting, Walkways, Bridges.

Number of items adjusted: -

Contract size adjustment: See Appendix BEAMS Note 2

Variations: For cost of Bridges see Category: Stairs, walkways.

The tank is normally set below the ground with an up stand topped with a safety rail. Cost includes up stand and safety rail. The cost excludes the bridge/ walkway and any mechanical equipment. The gross internal volume includes the volume of the weir.

Referencing details: Referencing of these items is very difficult and NO attempt must be made to climb on the surrounding apparatus in order to establish depths of the cylinder, cone or sump. Ask for suitable plans and take all of the measurements from them. Calculate GIV = m3. The calculation only includes part of the volume of the sump/pit, however, as the volume of the residue of the sump is relatively small the difference may be disregarded. The total diameter should include the weir.

Cost information notes: For cost purposes the rate provided is in terms of Gross Internal Volume however for calculation of the volume of the tank for rateability regard is to be given to the total cubic capacity in accordance with Class 4(d) (measured externally and excluding foundations, settings, supports, and anything, which is not an integral part of the item).

Rateable element: Class 4 Table 4 Tanks. Class 4 Table 3 Bridges, Walkways

Non-rateable element: Class 4(d) does not exceed 400 cubic metres total cubic capacity (measured EXTERNALLY and EXCLUDING foundations, settings, supports, and anything, which is not an integral part of the item).and which is readily capable of being moved from one site and re-erected in its original state on another without substantial demolition of any surrounding structure. In reality most concrete tanks under 400 cubic metres either above

ground or below will not be capable of moving and re-erecting in its original state and thus are rateable. Most metal tanks under 400 cubic metres will be non-rateable.

Adjusted plant and machinery: Security lighting, Walkways, Bridges.

Number of items adjusted: -

Contract size adjustment: See Appendix BEAMS Note 2

Variations: For cost of Bridges see Category: Stairs, walkways.

Sewage treatment works

CG Code: 63M0ES

Specific: Sedimentation or Humus Tanks - Circular

Descriptive: Circular tanks

Tech 1: Reinforced concrete

Tech 2: < 25.0m³

Unit size: -

Unit of measurement: m3

ERC: £933

Superseded codes: -

Location factor: Location Adjustment Applicable (See Guidance Notes) - ERC = UK mean of 1.00

Description: A circular reinforced concrete sedimentation tank consisting of a central well, a sloping cone, vertical walls, and an outer weir. The angle of the sloping cone is usually 7.5 degrees or 10 degrees occasionally up to 30 degrees to the horizontal and allows for the settlement of sludge in the central bottom cone. The tank is normally set below the ground with an up stand topped with a safety rail. Cost includes up stand and safety rail. The cost excludes the bridge/ walkway and any mechanical equipment. The gross internal volume includes the volume of the weir.

Referencing details: Referencing of these items is very difficult and NO attempt must be made to climb on the surrounding apparatus in order to establish depths of the cylinder, cone or sump. Description: Rectangular reinforced concrete sedimentation tank. The tank is of "shoe box" design with a flat or shallow gradient floor with a well (sump) at the lower end. The tank is normally set below ground with a 1 metre up stand topped with a safety rail. Cost includes sump construction, up stand and safety rail. Cost excludes bridges, mechanical handling equipment and any dividing wall/s. The gross internal volume excludes the volume of the weir.

Referencing details: Gross Internal Volume. Internal dividing walls measured as m2 of wall area

Cost information notes: For cost purposes the rate provided is in terms of Gross Internal Volume however for calculation of the volume of the tank for rating the volume is Gross External in accordance with Class 4(d) (measured externally and excluding foundations, settings, supports, and anything, which is not an integral part of the item). Dividing wall additional costs apply to all tanks over 100m3

Rateable element: Class 4 Table 4 Tanks. Class 4 Table 3 Bridges, Walkways

Non-rateable element: Class 4(d) does not exceed 400 cubic metres total cubic capacity (measured EXTERNALLY and EXCLUDING foundations, settings, supports, and anything, which is not an integral part of the item).and which is readily capable of being moved from one site and re-erected in its original state on another without substantial demolition of any surrounding structure. In reality most concrete tanks under 400 cubic metres either above ground or below will not be capable of moving and re-erecting in its original state and thus are rateable. Most metal tanks under 400 cubic metres will be non-rateable.

Adjusted plant and machinery: Security lighting, walkways, platforms and stairs, bridges.

Sewage treatment works

CG Code: 63M0M1

Specific: Sludge digesters

Descriptive: Metal or concrete tanks

Tech 1: -

Tech 2: -

Unit size: -

Unit of measurement: m3

ERC: £296

Superseded codes: -

Location factor: Location Adjustment Applicable (See Guidance Notes) - ERC = UK mean of 1.00

Description: Concrete or metal tank with steeply sloping reinforced concrete base (up to 45 degrees) used for digesting sludge to produce sludge gas, which is used as a fuel in the production of electricity. Heat is controlled by way of hot water/steam heating pipes in order to maintain a constant temperature. Sludge lies in the tank on average 14 to 30 days. Walls of tank are insulated if constructed of metal. Cost includes formed tank bottom but do not include the heavy raft or piles that may be employed under this heavy tank. There is always a lightning conductor on the roof, and this is an additional cost.

Referencing details: Gross internal Volume (GIV) m3 - if plans not available obtain sludge working volume and add 10% for gas volume above sludge.

Cost information notes: The costs should include the tank cover but exclude any mechanical plant or heating equipment and any tank ladders or handrails.

Rateable element: Class 4 Table 4 Tanks

Non-rateable element: Class 4(d) does not exceed 400 cubic metres total cubic capacity (measured EXTERNALLY and EXCLUDING foundations, settings, supports, and anything, which is not an integral part of the item).and which is readily capable of being moved from one site and re-erected in its original state on another without substantial demolition of any surrounding structure. Cost information notes: Costs exclude any tank cover.

Rateable element: Class 4 Table 4 Tanks Note: Some metal tanks are under 400m3 but the bottom is concrete (not metal) and these are rateable (Class 4(d)).

Non-rateable element: Class 4(d) does not exceed 400 cubic metres total cubic capacity (measured EXTERNALLY and EXCLUDING foundations, settings, supports, and anything, which is not an integral part of the item).and which is readily capable of being moved from one site and re-erected in its original state on another without substantial demolition of any surrounding structure. In reality most concrete tanks under 400 cubic metres either above ground or below will not be capable of moving and re-erecting in its original state and thus are rateable. Most metal tanks under 400 cubic metres will be non-rateable.

Adjusted plant and machinery: Security lighting

Number of items adjusted: Security lighting

Contract size adjustment: See Appendix BEAMS Note 2

Variations: Concrete Tanks - Dividing Walls: additional cost for tanks over 100m3 GIV see dividing walls.

Sewage treatment works

CG Code: 63M018

Specific: Sludge tanks

Descriptive: Metal circular

Tech 1: Concrete base

Tech 2: Over 250m³ - 500m³

Unit size: -

Unit of measurement: m3

ERC: £84

Superseded codes: -

Location factor: Location Adjustment Applicable (See Guidance Notes) - ERC = UK mean of 1.00

Description: Metal tank wall formed of metal panels, curved to the correct diameter, bolted and sealed with mastic or welded. Steel thickness will vary but 6mm to 10mm normal. Built above ground on a concrete base, with the base forming the floor of the tank. The cost includes the concrete base and any access ladders but exclude any mechanical handling equipment and control valves.

Referencing details: Gross internal Volume (GIV) m3

Cost information notes: Costs exclude any tank cover.

Rateable element: Class 4 Table 4 Tanks Note: Some metal tanks are under 400m3 and the bottom is concrete (not metal) and these are rateable (Class 4(d)).

Non-rateable element: Class 4(d) does not exceed 400 cubic metres total cubic capacity (measured EXTERNALLY and EXCLUDING foundations, settings, supports, and anything, which is not an integral part of the item).and which is readily capable of being moved from one site and re-erected in its original state on another without substantial demolition of any surrounding structure. Sewage treatment works

CG Code: 63M0F1

Specific: Storm tanks

Descriptive: Rectangular sloped base

Tech 1: Reinforced concrete

Tech 2: Over 250.0m³ - 500.0m³

Unit size: -

Unit of measurement: m3

ERC: £453

Superseded codes: -

Location factor: Location Adjustment Applicable (See Guidance Notes) - ERC = UK mean of 1.00

Description: Reinforced concrete rectangular tank with a shallow gradient floor. Used for the storage of storm water prior to its return for treatment through the works. Tank normally set mostly below ground level. Each tank has an outlet sump, and this is included in the volume. There is normally an overflow chamber to allow for direct flow to the watercourse in extreme conditions. Cost includes safety rail but excludes any overflow chamber.

Referencing details: Gross Internal Volume (GIV) m3

Cost information notes: For cost purposes the rate provided is in terms of Gross Internal Volume however for calculation of the volume of the tank for rateability regard is to be given to the total cubic capacity in accordance with Class 4(d) (measured externally and excluding foundations, settings, supports, and anything, which is not an integral part of the item).

Rateable element: Class 4 Table 4 Tank

Non-rateable element: Class 4(d) does not exceed 400 cubic metres total cubic capacity (measured EXTERNALLY and EXCLUDING foundations, settings, supports, and anything, which is not an integral part of the item).and which is readily capable of being moved from one site and re-erected in its original state on another without substantial demolition of any surrounding structure. Contract size adjustment: See Appendix BEAMS Note 2

Variations: -

Sewage treatment works

CG Code: 63M0N2

Specific: Tertiary treatment tank

Descriptive: Concrete rectangular

Tech 1: Over 750.0m³

Tech 2: -

Unit size: -

Unit of measurement: m3

ERC: £121

Superseded codes: -

Location factor: Location Adjustment Applicable (See Guidance Notes) - ERC = UK mean of 1.00

Description: An additional treatment used on some works for the final polishing of effluent before disposal into watercourse. Reinforced concrete tank, part filled with media usually set below ground level. Wall 300 mm above ground with safety rail set in. Cost includes safety rail but excludes any walkways, filtration media and mechanical plant.

Referencing details: Gross Internal Volume (GIV) m3

Cost information notes: Costs are to exclude any dividing wall/s however the Contractor is required to provide a separate cost for dividing walls. Costs are to include the safety rail.

Rateable element: Class 4 Table 4 Tank

Non-rateable element: -

Adjusted plant and machinery: Security lighting

Number of items adjusted: -

Sewage treatment works

CG Code: 63M0Q1

Specific: Gas holders

Descriptive: Spiral or telescopic tanks

Tech 1: 5000.0m³ typical

Tech 2: -

Unit size: -

Unit of measurement: m3

ERC: £370

Superseded codes: -

Location factor: Location Adjustment Applicable (See Guidance Notes) - ERC = UK mean of 1.00

Description: Plate metal traditional gas holder either spiral or telescopic type. Usually water sealed on concrete base. Used for the storage of sludge gas, which has been processed and is mainly methane (Methane 65% Carbon Dioxide 30%). Average size holder is 5000 m3. Cost includes ladders and handrails round top of tank.

Referencing details: Gross internal Volume (GIV) m3

Cost information notes: Costs are for standard size tanks although other sizes are available. Costs do not include for associated condensate chambers, lightning protection or surrounding paving, stairs, walkways (metal or concrete)

Rateable element: Class 4 Table 4 Gas Holders Class 4 Table 4 Tanks Note size limitation Preamble to Class 4 (d) Class 4 Table 3 foundations

Non-rateable element: Class 4(d) does not exceed 400 cubic metres total cubic capacity (measured EXTERNALLY and EXCLUDING foundations, settings, supports, and anything, which is not an integral part of the item).and which is readily capable of being moved from one site and re-erected in its original state on another without substantial demolition of any surrounding structure. In reality most concrete tanks under 400 cubic metres either above ground or below will not be capable of moving and re-erecting in its original state and thus are rateable. Most metal tanks under 400 cubic metres will be non-rateable.

Sewage treatment works

CG Code: 40POOA

Specific: Sedimentation tanks

Descriptive: Dorr thickener or clarrifloculator

Tech 1: 12m diam

Tech 2: 289m³

Unit size: per m3 Gross Internal Volume

Unit of measurement: m3

ERC: £311

Superseded codes: -

Location factor: Location Adjustment Applicable (See Guidance Notes) - ERC = UK mean of 1.00

Description: A Dorr thickener is a particular type of sedimentation tank- usually of concrete construction, open topped and having a central tower commonly found in sewage treatment works. Sizes range from 10-200m diameter. The actual thickener comprises an underwater raking mechanism and a drive head which supplies motive power. A fixed bridge may be present and windshields may be provided to the larger diameter tanks particularly in exposed locations. Access tunnels may be provided to the central tower. Generally constructed at two thirds wall depth below ground level. A Clarrifloculator is of similar construction and is used for removing solids from water that has been used to clean gas or air. It contains a small diameter steel or concrete tank (flocculating chamber) without top or bottom. Additives (reagents) are mixed with the fine solids suspended in the water in the flocculating chamber. These solids cling together and settle to the bottom of the tank, the water being agitated by moving paddles. Rotating rakes and the sloping base of the tank funnel the solids away to a central sludge withdrawal pipe from where they are pumped away .The tank may contain a series of concrete troughs (launders) at the perimeter and near the surface of the water, with perforations to assist the recovery of the purified (supernatant) water. Generally constructed with two thirds wall depth below ground level. For cost purposes the rate provided is in terms of Gross Internal Volume.

Referencing details: Gross internal Volume (GIV) m3

Cost information notes: NOTE: The rate does not include tank equipment, gantries or bridges

Rateable element: Class 4 Table 4 Tanks. Class 4 Table 3 Bridges, Walkways

Non-rateable element: Class 4(d) does not exceed 400 cubic metres total cubic capacity (measured EXTERNALLY and EXCLUDING foundations, settings, supports, and anything, which is not an integral part of the item).and which is readily capable of being moved from

Description: Normally reinforced concrete built under pump houses or powerhouses. May contain internal concrete walls and will have access stairs to deep basements or may have a lift. Internal face of walls, roof and floor painted as standard finish.

Referencing details: When additional finishes are found it will be necessary, to initially calculate the volume of the basement and further, the surface area of each additional finish.

Cost information notes: The Cost provided here is for the cost of constructing a basement, to a basic standard, in relation to its Volume (m3). Where additional finishes are applied to walls and floors, an addition needs to be made to this cost for providing such finishes. This cost excludes stairs, plinths, walkways etc.

Rateable element: Rateable as part of the "land and buildings.

Descriptive: Modular Units

Tech 1: Very high quality finishes

Tech 2: -

Unit size: m2

Unit of measurement: m2

ERC: £1,301

Superseded codes: -

Location factor: Considered Not Applicable at time of Publication

Description: High quality standard units finished to a high standard and typically used for prestigious offices, marketing suites and similar applications. Internal layouts can be designed to exact user requirements. They are delivered in volumetric format (i.e. fully factory prefabricated) and are placed in position on concrete pads or similar hard standing. Constructed of insulated plastic-coated steel externally with vinyl-faced plasterboard walls and polyester-coated steel ceiling internally. Doors are insulated steel-faced and windows are UPVC double glazed with low energy glass. The system uses complete modules to construct buildings with unlimited floor area; additional storeys may be added at any time (up to a maximum of four). Various optional extras are provided to suit individual requirements; these include various floor coverings, suspended ceilings, under floor heating and air conditioning.

Referencing details: Record GIA m2. External walls to be measured as per elevation.

Contract size adjustment: See Appendix BEAMS Note 1

Variations: Add for gantries, walkways and conveyors

Silo

CG Code: 43526A

Specific: Hopper Bottomed more than 6m diameter

Descriptive: Steel plate

Tech 1: 12mm

Tech 2: 200m3

Unit size: -

Unit of measurement: m3

ERC: £639

Superseded codes: -

Location factor: Location Adjustment Applicable (See Guidance Notes) - ERC = UK mean of 1.00

Description: A circular hopper bottomed structure of sheet steel plate of varying thickness, including support steelwork.

Referencing details: Diameter, Gross Internal Volume and Age. Also details of foundations and piling where applicable.

Cost information notes: Based on the volume of the hopper. Costs are for a single hopper. Costs include supporting steelwork but exclude foundations. For a heavy duty roof add 30%. For galvanised steel add 10% to cost.

Rateable element: -

Non-rateable element: -

Description: Commonly referred to as 'maxi bins'. Walls are constructed of galvanised curved corrugated steel sheets, lapped, double bolted and sealed with mastic at base. Incorporating an access door, the structure has a conical ribbed roof with central filler hatch and internal access ladder, side handrails and handrails at high level.

Referencing details: Holding volume of bin in order to calculate Gross Volume. External works.

Cost information notes: Based on the volume of the hopper. Costs are for a single hopper. Costs include supporting steelwork but exclude foundations. For a heavy duty roof add 30%. For galvanised steel add 10% to cost.

ERC: £112

Superseded codes: -

Location factor: Location Adjustment Applicable (See Guidance Notes) - ERC = UK mean of 1.00

Description: Commonly referred to as 'maxi bins'. Walls are constructed of galvanised curved corrugated steel sheets, lapped, double bolted and sealed with mastic at base. Incorporating an access door, the structure has a conical ribbed roof with central filler hatch and internal access ladder, side handrails and handrails at high level.

Referencing details: Holding volume of bin in order to calculate Gross Volume. External works.

Cost information notes: The costs are for single bins but as most installations will have several bins often linked with gantries / walkways with caged access ladders from ground level, these items will need to be added separately. Wheat = 0.77 tonnes/m3, Barley = 0.69 tonnes/m3. Cost includes foundations and erection costs. For quantities of 5 - 10 bins allow 10% discount, these discounts also apply to catwalks and ladders.

Silo

CG Code: 43580W

Specific: Hopper bottomed

Descriptive: Galvanised steel with ribbed roof

Tech 1: Diameter 9.14m

Tech 2: 1201m3

Unit size: -

Unit of measurement: m3

ERC: £139

Superseded codes: -

Location factor: Location Adjustment Applicable (See Guidance Notes) - ERC = UK mean of 1.00

Description: Walls constructed of galvanised curved corrugated steel sheets, lapped, double and bolted - incorporating access door, conical ribbed roof with central filler hatch and internal access ladder, side handrails and handrails a high level. Hopper cone may be 40, 45 or 60 degrees. The hopper is raised above a concrete slab with steel columns attached to a curved ring beam. The columns are usually diagonally braced.

Referencing details: Holding volume of bin in order to calculate Gross Volume. External works.

Cost information notes: Rates include for concrete base slab, steelwork supports, roof and cone outlet. The costs are for single bins but as most installations will have several bins often linked with gantries / walkways with caged access ladders from ground level, these items will need to be added separately. On very high bins outside sheeting may be taken to ground level. Wheat = 0.77 tonnes/m3, Barley = 0.69 tonnes/m3. Cost includes foundations and erection costs. For quantities of 5 - 10 bins allow 10% discount. For quantities of 10 or more bins allow 15% discount. These discounts also apply to catwalks and ladders used in conjunctions with silos.

Solar Thermal Panels

CG Code: 206S50

Specific: Solar Panels

Descriptive: Evacuated tube

Tech 1: -

Tech 2: -

Unit size: -

Unit of measurement: m2

ERC: £1,269

Superseded codes: -

Location factor: Location Adjustment Applicable (See Guidance Notes) - ERC = UK mean of 1.00

Description: Solar thermal panels using vacuum tubes are the most efficient method of capturing solar radiation and turning it into useable heat, with efficiencies of over 90%. The system consists of the evacuated tube panel, insulated pipework, expansion vessel, controller pump, fittings and vented twin coil electric cylinder These should not be confused with Photo Voltaic (PV) panels that convert solar radiation (photons) into electricity. Includes Installation and access to roof.

Referencing details: Determine area of panels

Cost information notes: Panels are normally supplied in kits based on number of tubes per panel and will have length and width dimensions. Cost is per m2.

Rateable element: Solar Panels, supports, controls and accessories may be rateable under Class 1 Table 1 (n) and List of Accessories but only if used mainly or exclusively in connection with power. Will be rateable under Class 2 heating Table 2 (b) . Supports alone may be rateable under class 4 Table 3.

Non-rateable element: Cost includes supply and installation of panels, controls, pump, expansion vessel & vented cylinder, but excludes the cost of any hot water or heating system to which they may be connected.

Adjusted plant and machinery: -

Number of items adjusted: The item can typically be found on an industrial, commercial or office complex. Some hereditaments may have multiple items, in which case the ERC needs to reflect the number of items.

Contract size adjustment: See Appendix BEAMS Note 1

Variations: -

Unit size: -

Unit of measurement: Each

ERC: £837,857

Superseded codes: -

Location factor: Location Adjustment Applicable (See Guidance Notes) - ERC = UK mean of 1.00

Description: Sports Grounds, athletics track, 8 lane synthetic track - 400m (Club Standard). IAAF size standards (1.2m width per lane). Cost includes site clearance, geotextile membrane, 250mm MOT Type 1, macadam 65mm porous macadam (40mm base course, with nominal aggregate size of 20mm, and 25mm wearing course, with nominal aggregate size of 10mm. 150 x 100mm edgings to sizes of track). Polyurethane rubber athletics track surface with line marking. Please note only a French drain has been allowed to the outside of the track with a nominal allowance to connect into an existing drainage system. Cost does not include the provision of a dedicated drainage provision to the facility.

Referencing details: Track and external works

Cost information notes: Cost only includes the track and minimal external works. Total track area allowed - 5008m2. Cost excludes the central playing pitch, barrier to the perimeter, dedicated sporting equipment e.g. hurdles and a water supply.

Tech 2: 86 lux

Unit size: -

Unit of measurement: Each

ERC: £72,614

Superseded codes: -

Location factor: Location Adjustment Applicable (See Guidance Notes) - ERC = UK mean of 1.00

Description: Sports Ground Athletics Track - Floodlighting.(Please note this is based on modern day equivalent based on 4 Columns - Each 16m high with lamps to provide 100 Lux which is likely to be the current minimum standard Sport England recommend). Cost data used to produce the rate is based upon circa 8 luminaries. Modern installation , mounted on a tubular steel column, which is hinged to allow it to be lowered for maintenance. Average illumination levels alter depending on use and standard of facility provided i.e. recreational to international. Different configurations of columns , column heights and number of lamps can be used to achieve the same average illumination. Please note: This item includes 4 number columns as a package

Referencing details: Facilities subject to television coverage will require a minimum of 1000 Lux. Known media coverage suggests a higher cost should be selected.

Cost information notes: Factors affecting cost : Height and number of columns/lamp heads. Cost includes concrete foundations, 50m of external duct (per column) to permit a power supply. Cost excludes any provision to enhance an existing power supply to support this installation. Columns not hinged will have a lower capital cost but will attract a higher overall lifecycle cost due to enhanced maintenance costs i.e. cherry pickers for bulb replacement.

ERC: £30,721

Superseded codes: -

Location factor: Location Adjustment Applicable (See Guidance Notes) - ERC = UK mean of 1.00

Description: Single Tennis Court - Floodlighting. Please note this is based on modern day equivalent based on 6 Columns - Each 8m high with lamps to provide 120 Lux. Modern installations mounted on a tubular steel column, which is hinged to allow it to be lowered for maintenance. Average illumination levels vary depending on use and standard of facility provided i.e. recreational to international. Different configurations of columns, column heights and number of lamps can be used to achieve the same average illumination. Cost includes 6 number columns as a package

Referencing details: Facilities subject to television coverage will require a minimum of 1000 Lux. Known media coverage suggests a higher cost should be selected.

Cost information notes: Factors affecting cost : Height and number of columns/lamp heads. Cost includes concrete foundations, 50m of external duct (per column) to permit a power supply. Cost excludes any provision to enhance an existing power supply to support this installation. Columns not hinged will have a lower capital cost but will attract a higher overall lifecycle cost due to enhanced maintenance costs i.e. cherry pickers for bulb replacement.

ERC: £8,913

Superseded codes: -

Location factor: Location Adjustment Applicable (See Guidance Notes) - ERC = UK mean of 1.00

Description: Reinforced concrete staircase and metal handrail to one side, 2.6m standard rise, no other finishes.

Referencing details: Either measure floor to floor height for dogleg type or measure horizontal length of stair case

Cost information notes: -

Rateable element: -

Non-rateable element: -

Adjusted plant and machinery: -

Number of items adjusted: The item can typically be found on an industrial, commercial or office complex. Some hereditaments may have multiple items, in which case the ERC needs to reflect the number of items.

Contract size adjustment: See Appendix BEAMS Note 2

Variations: -

Stairs, Ladders and Walkways

CG Code: 30K02F

Specific: Reinforced concrete staircase

Descriptive: Terrazzo finish, balustrade and handrail

Tech 1: 3m rise

Tech 2: Plaster skim and paint to soffit

Unit size: -

Unit of measurement: Each

ERC: £11,963

Superseded codes: -

Location factor: Location Adjustment Applicable (See Guidance Notes) - ERC = UK mean of 1.00

Description: Softwood Staircase; softwood balustrade and hardwood handrail; plasterboard; skim and emulsion to soffit.

Referencing details: Either measure floor to floor height for dogleg type or measure horizontal length of stair case

Cost information notes: -

Rateable element: -

Non-rateable element: -

Adjusted plant and machinery: -

Number of items adjusted: -

Contract size adjustment: See Appendix BEAMS Note 2

Variations: -

Stairs, Ladders and Walkways

CG Code: 30K02K

Specific: Reinforced concrete staircase

Descriptive: Terrazzo finish, s/s balustrade and handrail

Tech 1: 3m rise

Tech 2: Plaster skim and paint to soffit

Unit size: -

Unit of measurement: Each

ERC: £14,202

Superseded codes: -

Location factor: Location Adjustment Applicable (See Guidance Notes) - ERC = UK mean of 1.00

Description: Softwood Staircase; softwood balustrade and hardwood handrail; plasterboard; skim and emulsion to soffit.

Referencing details: Either measure floor to floor height for dogleg type or measure horizontal length of stair case

Cost information notes: -

Rateable element: -

Non-rateable element: -

Adjusted plant and machinery: -

Number of items adjusted: -

Contract size adjustment: See Appendix BEAMS Note 2

Variations: -

Stairs, Ladders and Walkways

CG Code: 30K02P

Specific: Reinforced concrete staircase

Descriptive: Quality finishes, glass and s/s balustrades

Tech 1: 3m rise

Tech 2: Plaster skim and paint to soffit

Unit size: -

Unit of measurement: Each

ERC: £22,669

Superseded codes: -

Location factor: Location Adjustment Applicable (See Guidance Notes) - ERC = UK mean of 1.00

Description: Softwood Staircase; softwood balustrade and hardwood handrail; plasterboard; skim and emulsion to soffit.

Referencing details: Either measure floor to floor height for dogleg type or measure horizontal length of stair case

Cost information notes: -

Rateable element: -

Non-rateable element: -

Adjusted plant and machinery: -

Number of items adjusted: -

Contract size adjustment: See Appendix BEAMS Note 2

Variations: -

Stairs, Ladders and Walkways

CG Code: 30K0A5

Specific: Metal Stairs 3m rise

Descriptive: Open perforated treads

Tech 1: Heavy duty cast iron straight

Tech 2: 1.548 dia. with handrail to outside

Unit size: -

Unit of measurement: Each

ERC: £6,105

Superseded codes: -

Location factor: Location Adjustment Applicable (See Guidance Notes) - ERC = UK mean of 1.00

Description: Single flight at 45 degrees includes, steps (open mesh with non-slip nosing) 1070mm wide. Galvanised. Hand railing is fitted both sides with tubular top and mid rails.

Referencing details: -

Cost information notes: Excludes cost of landings

Rateable element: -

Non-rateable element: -

Adjusted plant and machinery: -

Number of items adjusted: -

Contract size adjustment: See Appendix BEAMS Note 2

Variations: -

Stairs, Ladders and Walkways

CG Code: 30K0A9

Specific: Metal Stairs 3m rise

Descriptive: Open perforated treads

Tech 1: Heavy duty cast iron spiral

Tech 2: Balustrade and handrail to 2 sides

Unit size: -

Unit of measurement: Each

ERC: £7,123

Superseded codes: -

Location factor: Location Adjustment Applicable (See Guidance Notes) - ERC = UK mean of 1.00

Description: Single flight at 45 degrees includes, steps (open mesh with non-slip nosing) 1070mm wide. Galvanised. Hand railing is fitted both sides with tubular top and mid rails.

Referencing details: -

Cost information notes: Excludes cost of landings

Stairs, Ladders and Walkways

CG Code: 30K0D5

Specific: Metal - feature - swimming pool

Descriptive: Spiral to water chute

Tech 1: 9m rise with platforms

Tech 2: Stainless steel treads with inset tiling

Unit size: -

Unit of measurement: Each

ERC: £88,191

Superseded codes: -

Location factor: Location Adjustment Applicable (See Guidance Notes) - ERC = UK mean of 1.00

Description: Stairs Ladders Walkways - Stairs - Metal Construction. Feature. Galvanised finish, perforated treads; no risers, decorated, 3.0 m rise including balustrades and handrails, typical width 1.0 m.

Referencing details: Vertical height= m width and type- straight , spiral, dogleg, etc.

Cost information notes: Feature staircases usually within buildings - See Stairs/finishes: 201N55

Rateable element: -

Non-rateable element: -

Adjusted plant and machinery: -

Number of items adjusted: -

Contract size adjustment: See Appendix BEAMS Note 2

Variations: -

Stairs, Ladders and Walkways

CG Code: 30K0K5

Specific: Finishes

Descriptive: Floor coverings

Tech 1: Vinyl floor tiles

Tech 2: -

Unit size: Per flight

Unit of measurement: Each

ERC: £1,169

Superseded codes: -

Location factor: Location Adjustment Applicable (See Guidance Notes) - ERC = UK mean of 1.00

Description: Rubber studded tiles ; level fixing with adhesive; butt joints, straight to sand cement base.

Referencing details: Measure to m2

Cost information notes: Excludes cost of landings

Rateable element: -

Non-rateable element: -

Adjusted plant and machinery: -

Number of items adjusted: -

Contract size adjustment: See Appendix BEAMS Note 2

Variations: This includes an allowance for a 50mm sand cement screed. Where finish is placed to staircase area; assuming 13 risers (180mm), 12 treads (275mm), 900mm wide steps - use code 30K0KV1. This includes screed as above and aluminium grades or equivalent medium duty nosing , 56mm x 32mm ; plugged and screwed.

Stairs, Ladders and Walkways

CG Code: 30K0KA

Specific: Finishes

Descriptive: Floor coverings

Tech 1: Granolithic topping

Tech 2: -

Unit size: Per flight

Unit of measurement: Each

ERC: £418

Superseded codes: -

Location factor: Location Adjustment Applicable (See Guidance Notes) - ERC = UK mean of 1.00

Description: Granolithic paving; cement and granite chippings 5 to dust (1:1:2); steel towelled. The cost for work to floors ; one coat; level; laid on concrete while green; bonded ; over 600mm ; 38mm thick use code 30K0KV2. Where the work is to treads ; 275mm wide (open risers); the rate for a flight based on 13 treads of 900mm long.

Referencing details: Measure to m2

Cost information notes: Excludes cost of landings

Rateable element: -

Non-rateable element: -

Adjusted plant and machinery: -

Number of items adjusted: -

Contract size adjustment: See Appendix BEAMS Note 2

CG Code: 30K0KK

Specific: Finishes

Descriptive: Floor coverings

Tech 1: Terrazzo

Tech 2: -

Unit size: -

Unit of measurement: Each

ERC: £3,512

Superseded codes: -

Location factor: Location Adjustment Applicable (See Guidance Notes) - ERC = UK mean of 1.00

Description: Terrazzo tiles ; aggregate size random ground grouted and polished to 80's grit finish ; standard colour range ; 3mm joints symmetrical layout; bedding in 42mm cement semi dry mix (1:4); grouting with neat matching cement.

Referencing details: Measure to m2

Cost information notes: Excludes cost of landings

Rateable element: -

Non-rateable element: -

Adjusted plant and machinery: -

Number of items adjusted: -

Contract size adjustment: See Appendix BEAMS Note 2

Variations: Rate for large areas ; 300mm x 300mm x 28mm terrazzo tile units; hydraulic pressed; mechanically vibrated, team cured; to floors on concrete base; sealed with hardener (2 coats); plain ; laid level. Use code 30K0KV4. Staircase - 13 steps(treads (280mm) / risers), 900mm wide ; terrazzo specially made precast units ; standard colour range ; 3mm joints with neat matching cement; standard tread and riser square combined terrazzo units (with riser case down); includes incorporated Ferodo anti slip insert; fixed with cement :sand (1:4) mortar on prepared background.

Stairs, Ladders and Walkways

CG Code: 30K0P5

Specific: Handrails and Balustrades

Descriptive: Wall handrail

Tech 1: On brackets

Tech 2: PVC covered mild steel

Unit size: -

Unit of measurement: m

ERC: £202

Superseded codes: -

Location factor: Location Adjustment Applicable (See Guidance Notes) - ERC = UK mean of 1.00

Description: Plastic covered metal handrail fixed to wall on brackets.

Referencing details: Measure to m

Cost information notes: -

Steelwork

CG Code: 215NNE

Specific: Stairs, Handrails and Walkways

Descriptive: Metal

Tech 1: Weight of steel - galvanised

Tech 2: Price per tonne

Unit size: -

Unit of measurement: Tonnes

ERC: £4,897

Superseded codes: -

Location factor: Location Adjustment Applicable (See Guidance Notes) - ERC = UK mean of 1.00

Description: All-in general rate for fabricated small section steelwork, typical of the sections used for staircases, walkways, light framing and supports, handrails, balustrades etc. Section unlikely to exceed 150mm in any direction. Average weight of elements will be less than 15kg per linear metre.

Referencing details: Calculate weight in tonnes.

Cost information notes: -

Rateable element: Class 4 Table 3.

Non-rateable element: -

Adjusted plant and machinery: Concrete supports and foundations.

Number of items adjusted: The item can typically be found on an industrial, commercial or office complex. Some hereditaments may have multiple items, in which case the ERC needs to reflect the number of items.

Contract size adjustment: See Appendix BEAMS Note 2

Variations: -

Steelwork

CG Code: 215NNG

Specific: All-in average price

Descriptive: Weight of steel - galvanised

Tech 1: Price per tonne

Tech 2: -

Unit size: -

Unit of measurement: Tonnes

ERC: £3,558

Superseded codes: -

Location factor: Location Adjustment Applicable (See Guidance Notes) - ERC = UK mean of 1.00

Description: This an average figure for all average section structural and fabricated galvanised steelwork based on tonne rate.

Referencing details: For use where the exact weight and makeup of the steel work is such that detailed referencing cannot be undertaken either for safety or security or size reasons. Weight of steel to be estimated based on a detail of a specific section where possible.

Cost information notes: -

Rateable element: -

Non-rateable element: -

Adjusted plant and machinery: Concrete supports and foundations.

Number of items adjusted: -

Contract size adjustment: See Appendix BEAMS Note 2

ERC: £37

Superseded codes: -

Location factor: Location Adjustment Applicable (See Guidance Notes) - ERC = UK mean of 1.00

Description: Steelwork - Fire Protection - A non-combustible board in which the unique cellular structure of vermiculite is maintained by a pre-treatment process. This gives excellent thermal insulation properties with dimensional stability at high temperatures. It is used extensively for the fire protection of structural elements in buildings such as steel beams and columns and to provide up to 4 hours fire protection. It may also be used to protect sheet metal ducts and for the construction of smoke extraction ducts.

Referencing details: Dimensions and weights of beams or columns.

Cost information notes: Cost given per m2 of board covering. Excludes decorative finish.

ERC: £16

Superseded codes: -

Location factor: Location Adjustment Applicable (See Guidance Notes) - ERC = UK mean of 1.00

Description: Intumescent paint coating to steel beams and columns to achieve 1 hour fire resistance. Decorative final coat. Heat in a fire triggers a catalytic reaction causing expansion of an insulating char layer up to 50 times the paint film thickness. This keeps the steel below its critical temperature thus maintaining the structural stability of the building.

Referencing details: -

Cost information notes: This is a paint coverage that was previously measured in tonnes and has now been corrected to m2 as per measurement rules. Excludes decorative finish. Unit price relates to weight of steel being protected. See also Item Codes 31A055/A/F/K/P/U/31A060/5.

Location factor: Location Adjustment Applicable (See Guidance Notes) - ERC = UK mean of 1.00

Description: Single storey traditional construction with trapezoidal profile sheet roof covering laid on softwood trusses over one brick thick walls on concrete strip foundations, reinforced concrete ground floor slab with a trowelled finish. 1nr steel personnel door, 1nr electric industrial Roller Shutter door approx. size 3.5m x 3.0m. Basic electrical provision providing light and single phase 13amp power. No windows or roof lights provided. Basic rainwater goods and materials used for construction.

Referencing details: See Rating Manual Property Inspector Manual Section 5: Inspection of industrials

Cost information notes: Costs based on traditionally constructed equivalent modern replacement consisting brick walls, pitched trapezoidal roof on softwood trusses.

Rateable element: Refer to Rating Manual Section 5a: Valuation of all Property Classes, Section 380 Factories, Workshops and Warehouses.

Non-rateable element: Refer to Rating Manual Section 5a: Valuation of all Property Classes, Section 380 Factories, Workshops and Warehouses.

Adjusted plant and machinery: Refer to Rating Manual Section 5a: Valuation of all Property Classes, Section 380 Factories, Workshops and Warehouses.

Sugar beet factories

CG Code: 98A001

Specific: Flat Pad

Descriptive: Flat Concrete Storage Pad

Tech 1: -

Tech 2: -

Unit size: -

Unit of measurement: m2

ERC: £128

Superseded codes: STS034

Location factor: Location Adjustment Applicable (See Guidance Notes) - ERC = UK mean of 1.00

Description: Sugar beet is brought to site, weighed, sampled and laid on large flat concrete storage areas, known as flat pads, essentially a storage area. When required for processing, the beets are carried along flumes by running water which cleans the beet as it passes through machinery which separates soil, stones, weeds and other foreign matter before entering the factory.

Referencing details: Refer to Rating Manual: Section 5a: Valuation of all property classes: Beet sugar factories

Cost information notes: Refer to Rating Manual: Section 5a: Valuation of all property classes: Beet sugar factories

Rateable element: Refer to Rating Manual: Section 5a: Valuation of all property classes: Beet sugar factories

Sugar beet factories

CG Code: 98A005

Specific: Large concrete silos

Descriptive: 20m diameter

Tech 1: 36m high

Tech 2: 225mm thick walls

Unit size: -

Unit of measurement: Tonnes

ERC: £179

Superseded codes: -

Location factor: Location Adjustment Applicable (See Guidance Notes) - ERC = UK mean of 1.00

Description: These are large structures that will have been constructed in-situ and to the specification of the occupier. They are constructed of reinforced concrete off a prepared foundation base and the thickness of the concrete walls will be dictated by the height, diameter and intended holding capacity. The silos costed in this guide have wall thicknesses ranging from 225mm up to 275mm. The silo will usual have a conical internal base for discharge and at some point an access chamber and door. The cost is for the silo and excludes external works, external access stairways, platforms and ladders. Volume 9,712m3- capacity in sugar tonnes 8,000.

Referencing details: Refer to Rating Manual: Section 5a: Valuation of all property classes: Beet sugar factories

Cost information notes: The cost provided here is based on a rate per tonne of holding capacity of sugar. Refer to Rating Manual: Section 5a: Valuation of all property classes: Beet sugar factories

Rateable element: Refer to Rating Manual: Section 5a: Valuation of all property classes: Beet sugar factories

Non-rateable element: Refer to Rating Manual: Section 5a: Valuation of all property classes: Beet sugar factories

Sugar Beet Factories

CG Code: 98A016

Specific: Main Factory Building

Descriptive: Insulated Factory Building

Tech 1: Typically 2500m² GIA

Tech 2: Eaves Height - 15m

Unit size: 2500m²

Unit of measurement: m2

ERC: £0

Superseded codes: -

Location factor: Location Adjustment Applicable (See Guidance Notes) - ERC = UK mean of 1.00

Description: Building Area only; Site strip vegetation; Strip foundations; Column bases; Insulated Concrete GF slab with DPM and Mesh,150mm thick up to 10,000m², 200mm thick over 10,000m² GIA; Steel Portal frame with bolts and baseplates; Coated galvanised trapezoidal roof sheets with insulation on steel purlins; Roof lights; valley gutters; matching fascia and soffit; Rainwater downpipes and gutters; trapezoidal insulated wall system cladding on cladding rails; External roller shutter doors and personnel doors; Single phase electrics, lighting and power; Gas fuelled hot air burners Under slab storm drainage from internal downpipes on building area greater than 1,000m²

Referencing details: Refer to Rating Manual: Section 5a: Valuation of all property classes: Beet sugar factories

Cost information notes: The data consists of a typical Industrial shell. Works include the Industrial shell as described and works up to 1m perimeter to the building (1m wide paving slabs & foul/storm drainage), The cost include 2 no. personnel doors and roller shutters doors at 1 door up to 1,000m² , 2 roller doors over 1,000m² (GIA), and 4 roller doors over 5,000m². Costs are for the shell only and do not include for internal rooms such as offices or toilets which should be added for separately. See Variations for assistance.

Rateable element: Refer to Rating Manual: Section 5a: Valuation of all property classes: Beet sugar factories

Non-rateable element: Refer to Rating Manual: Section 5a: Valuation of all property classes: Beet sugar factories

Adjusted plant and machinery: Refer to Rating Manual: Section 5a: Valuation of all property classes: Beet sugar factories

Number of items adjusted: Refer to Rating Manual: Section 5a: Valuation of all property classes: Beet sugar factories

Contract size adjustment: See Appendix BEAMS Note 2

Variations: If Cavity Wall construction to lower walls then measure relevant wall area and use code 41P1V1, single block walls are cost neutral. Additional roller shutter doors over and above the beacon specification should be added using code 41P1V2 . Additional personnel doors over the assumed 2no. - add Code 41P1V3. If heating is required an addition using code 41P1V4 (GIA) should be made to the beacon cost. Internal offices (in Industrial complexes) should be added by reference to Cost Guide code series 42P04A - 42P40V, Internal WC - 42P40W

Location factor: Location Adjustment Applicable (See Guidance Notes) - ERC = UK mean of 1.00

Description: Building Area only; Site strip vegetation; Strip foundations; Column bases; Insulated Concrete GF slab with DPM and Mesh,150mm thick up to 10,000m², 200mm thick over 10,000m² GIA; Steel Portal frame with bolts and baseplates; Coated galvanised trapezoidal roof sheets with insulation on steel purlins; Roof lights; valley gutters; matching fascia and soffit; Rainwater downpipes and gutters; trapezoidal insulated wall system cladding on cladding rails; External roller shutter doors and personnel doors; Single phase electrics, lighting and power; Gas fuelled hot air burners Under slab storm drainage from internal downpipes on building area greater than 1,000m²

Referencing details: Refer to Rating Manual: Section 5a: Valuation of all property classes: Beet sugar factories

Cost information notes: The data consists of a typical Industrial shell. Works include the Industrial shell as described and works up to 1m perimeter to the building (1m wide paving slabs & foul/storm drainage), The cost include 2 no. personnel doors and roller shutters doors at 1 door up to 1,000m² , 2 roller doors over 1,000m² (GIA), and 4 roller doors over 5,000m². Costs are for the shell only and do not include for internal rooms such as offices or toilets which should be added for separately. See Variations for assistance.

Rateable element: Refer to Rating Manual: Section 5a: Valuation of all property classes: Beet sugar factories

Non-rateable element: Refer to Rating Manual: Section 5a: Valuation of all property classes: Beet sugar factories

Adjusted plant and machinery: Refer to Rating Manual: Section 5a: Valuation of all property classes: Beet sugar factories

Number of items adjusted: Refer to Rating Manual: Section 5a: Valuation of all property classes: Beet sugar factories

Contract size adjustment: See Appendix BEAMS Note 2

Variations: If Cavity Wall construction to lower walls then measure relevant wall area and use code 41P1V1, single block walls are cost neutral. Additional roller shutter doors over and above the beacon specification should be added using code 41P1V2 . Additional personnel doors over the assumed 2no. - add Code 41P1V3. If heating is required an addition using code 41P1V4 (GIA) should be made to the beacon cost. Internal offices (in Industrial complexes) should be added by reference to Cost Guide code series 42P04A - 42P40V, Internal WC - 42P40W

Costs are for the shell only and do not include for internal rooms such as offices or toilets which should be added for separately. See Variations for assistance.

Rateable element: Refer to Rating Manual: Section 5a: Valuation of all property classes: Beet sugar factories

Non-rateable element: Refer to Rating Manual: Section 5a: Valuation of all property classes: Beet sugar factories

Adjusted plant and machinery: Refer to Rating Manual: Section 5a: Valuation of all property classes: Beet sugar factories

Number of items adjusted: Refer to Rating Manual: Section 5a: Valuation of all property classes: Beet sugar factories

Contract size adjustment: See Appendix BEAMS Note 2

Variations: If Cavity Wall construction to lower walls then measure relevant wall area and use code 41P1V1, single block walls are cost neutral. Additional roller shutter doors over and above the beacon specification should be added using code 41P1V2 . Additional personnel doors over the assumed 2no. - add Code 41P1V3. If heating is required an addition using code 41P1V4 (GIA) should be made to the beacon cost. Internal offices (in Industrial complexes) should be added by reference to Cost Guide code series 42P04A - 42P40V, Internal WC - 42P40W

Sugar Beet Factories

CG Code: 98A030

Specific: Main Factory Building

Descriptive: Insulated Factory Building

Tech 1: Typically 2500m² GIA

Tech 2: Eaves Height - 29m

Unit size: 2500m²

Unit of measurement: m2

ERC: £0

Superseded codes: -

Location factor: Location Adjustment Applicable (See Guidance Notes) - ERC = UK mean of 1.00

Description: Building Area only; Site strip vegetation; Strip foundations; Column bases; Insulated Concrete GF slab with DPM and Mesh,150mm thick up to 10,000m², 200mm thick over 10,000m² GIA; Steel Portal frame with bolts and baseplates; Coated galvanised trapezoidal roof sheets with insulation on steel purlins; Roof lights; valley gutters; matching fascia and soffit; Rainwater downpipes and gutters; trapezoidal insulated wall system cladding on cladding rails; External roller shutter doors and personnel doors; Single phase electrics, lighting and power; Gas fuelled hot air burners Under slab storm drainage from internal downpipes on building area greater than 1,000m²

Referencing details: Refer to Rating Manual: Section 5a: Valuation of all property classes: Beet sugar factories

Cost information notes: The data consists of a typical Industrial shell. Works include the Industrial shell as described and works up to 1m perimeter to the building (1m wide paving slabs & foul/storm drainage), The cost include 2 no. personnel doors and roller shutters doors at 1 door up to 1,000m² , 2 roller doors over 1,000m² (GIA), and 4 roller doors over 5,000m². Costs are for the shell only and do not include for internal rooms such as offices or toilets which should be added for separately. See Variations for assistance.

ERC: £0

Superseded codes: -

Location factor: Location Adjustment Applicable (See Guidance Notes) - ERC = UK mean of 1.00

Description: Building Area only; Site strip vegetation; Strip foundations; Column bases; Insulated Concrete GF slab with DPM and Mesh,150mm thick up to 10,000m², 200mm thick over 10,000m² GIA; Steel Portal frame with bolts and baseplates; Coated galvanised trapezoidal roof sheets with insulation on steel purlins; Roof lights; valley gutters; matching fascia and soffit; Rainwater downpipes and gutters; trapezoidal insulated wall system cladding on cladding rails; External roller shutter doors and personnel doors; Single phase electrics, lighting and power; Gas fuelled hot air burners Under slab storm drainage from internal downpipes on building area greater than 1,000m²

Referencing details: Refer to Rating Manual: Section 5a: Valuation of all property classes: Beet sugar factories

Cost information notes: The data consists of a typical Industrial shell. Works include the Industrial shell as described and works up to 1m perimeter to the building (1m wide paving slabs & foul/storm drainage), The cost include 2 no. personnel doors and roller shutters doors at 1 door up to 1,000m² , 2 roller doors over 1,000m² (GIA), and 4 roller doors over 5,000m². Costs are for the shell only and do not include for internal rooms such as offices or toilets which should be added for separately. See Variations for assistance.

Rateable element: Refer to Rating Manual: Section 5a: Valuation of all property classes: Beet sugar factories

Non-rateable element: Refer to Rating Manual: Section 5a: Valuation of all property classes: Beet sugar factories

Adjusted plant and machinery: Refer to Rating Manual: Section 5a: Valuation of all property classes: Beet sugar factories

Number of items adjusted: Refer to Rating Manual: Section 5a: Valuation of all property classes: Beet sugar factories

Contract size adjustment: See Appendix BEAMS Note 2

Variations: If Cavity Wall construction to lower walls then measure relevant wall area and use code 41P1V1, single block walls are cost neutral. Additional roller shutter doors over and above the beacon specification should be added using code 41P1V2 . Additional personnel doors over the assumed 2no. - add Code 41P1V3. If heating is required an addition using code 41P1V4 (GIA) should be made to the beacon cost. Internal offices (in Industrial complexes) should be added by reference to Cost Guide code series 42P04A - 42P40V, Internal WC - 42P40W

Costs are for the shell only and do not include for internal rooms such as offices or toilets which should be added for separately. See Variations for assistance.

Rateable element: Refer to Rating Manual: Section 5a: Valuation of all property classes: Beet sugar factories

Non-rateable element: Refer to Rating Manual: Section 5a: Valuation of all property classes: Beet sugar factories

Adjusted plant and machinery: Refer to Rating Manual: Section 5a: Valuation of all property classes: Beet sugar factories

Number of items adjusted: Refer to Rating Manual: Section 5a: Valuation of all property classes: Beet sugar factories

Contract size adjustment: See Appendix BEAMS Note 2

Variations: If Cavity Wall construction to lower walls then measure relevant wall area and use code 41P1V1, single block walls are cost neutral. Additional roller shutter doors over and above the beacon specification should be added using code 41P1V2 . Additional personnel doors over the assumed 2no. - add Code 41P1V3. If heating is required an addition using code 41P1V4 (GIA) should be made to the beacon cost. Internal offices (in Industrial complexes) should be added by reference to Cost Guide code series 42P04A - 42P40V, Internal WC - 42P40W

Sugar Beet Factories

CG Code: 98A053

Specific: Main Factory Building

Descriptive: Insulated Factory Building

Tech 1: Typically 5000m² GIA

Tech 2: Eaves Height - 30m

Unit size: 5000m²

Unit of measurement: m2

ERC: £0

Superseded codes: -

Location factor: Location Adjustment Applicable (See Guidance Notes) - ERC = UK mean of 1.00

Description: Building Area only; Site strip vegetation; Strip foundations; Column bases; Insulated Concrete GF slab with DPM and Mesh,150mm thick up to 10,000m², 200mm thick over 10,000m² GIA; Steel Portal frame with bolts and baseplates; Coated galvanised trapezoidal roof sheets with insulation on steel purlins; Roof lights; valley gutters; matching fascia and soffit; Rainwater downpipes and gutters; trapezoidal insulated wall system cladding on cladding rails; External roller shutter doors and personnel doors; Single phase electrics, lighting and power; Gas fuelled hot air burners Under slab storm drainage from internal downpipes on building area greater than 1,000m²

Referencing details: Refer to Rating Manual: Section 5a: Valuation of all property classes: Beet sugar factories

Cost information notes: The data consists of a typical Industrial shell. Works include the Industrial shell as described and works up to 1m perimeter to the building (1m wide paving slabs & foul/storm drainage), The cost include 2 no. personnel doors and roller shutters doors at 1 door up to 1,000m² , 2 roller doors over 1,000m² (GIA), and 4 roller doors over 5,000m². Costs are for the shell only and do not include for internal rooms such as offices or toilets which should be added for separately. See Variations for assistance.

Sugar beet factories

CG Code: 98A064

Specific: Control Buildings

Descriptive: Basic

Tech 1: -

Tech 2: -

Unit size: -

Unit of measurement: m2

ERC: £0

Superseded codes: -

Location factor: Location Adjustment Applicable (See Guidance Notes) - ERC = UK mean of 1.00

Description: The cost is for a typical control room at an industrial complex and reflects a brick/block cavity walled building off a reinforced concrete strip foundations or slab. The roof will vary from basic flat timber framed felted roof to pitched roof with concrete roof tiles. There is likely to be extensive areas of glazing which will either be softwood or more recent build UPVC double glazed units. The access doors are also likely to be either softwood or UPVC. The internal finish will vary from a basic emulsion painted plastered walls and ceilings to more elaborate wall finishes. The flooring again will vary for basic vinyl floor tiles to carpeted areas. The cost includes for typical building services of electrical power and lighting, central heating and water. The cost does not include for any air handling systems that are now common place in such control rooms.

Referencing details: GIA - Applies to main floor area of boiler house (i.e. excludes intermediate floors. Refer to Rating Manual: Section 5a: Valuation of all property classes: Beet sugar factories

Cost information notes: Excludes any air handling and adjustments may have to be made of variations in quality and finishes. Also Refer to Rating Manual: Section 5a: Valuation of all property classes: Beet sugar factories

Description: Internal buildings (excludes control buildings.) up to 50m2 in area and 3 metres in height. Typical Construction. External Walls: Timber framed with sheet material cladding, including sound absorption materials and plasterboard inner face. Windows and Doors: Extensive double or triple glazed upvc for insulation both for sound and heat protection. Half glazed door. Internal Walls: Timber stud partitions. Internal Finishes: Emulsion paint to plastered walls and acoustic tile ceilings, and vinyl floor tiles. Building Services: - General lighting and extra power sockets for equipment; heating; air conditioning; fire alarms and emergency lighting, sprinklers. These are for single internal structures within an existing building. Variation may include brick walls, timber windows, raised access floors, soft floor coverings and built between storey heights. Usually constructed as single concrete block or stud partition walling with a timber frame flat roof. Internal painted walls. Building services will include electrical power and lighting.

Sugar beet factories

CG Code: 98A067

Specific: Boiler House

Descriptive: 500m2 GIA

Tech 1: Eaves height - 7.00m

Tech 2: -

Unit size: -

Unit of measurement: m2

ERC: £0

Superseded codes: -

Location factor: Location Adjustment Applicable (See Guidance Notes) - ERC = UK mean of 1.00

Description: The cost is for a typical boiler house commonly found at industrial complexes. The building depending on foot print will range from a light steel to heavy steel frame off a reinforced concrete beam or slab foundation base. The infill will normally be cavity walls of brick and concrete block with an internal finish of emulsion painted skimmed concrete or plaster walls. Windows and doors will be traditional softwood doors and windows. The roof is generally a profiled decked bitumen felt covered flat roof construction but variations are to be expected. The internal finish is hardened concrete floors and no ceiling. The building services will include, but not exclusively, water, electrical power and lighting. You will often find internal buildings that accommodate plant room and staff rest room/office.

Referencing details: GIA - Applies to main floor area of boiler house (i.e. excludes intermediate floors. Refer to Rating Manual: Section 5a: Valuation of all property classes: Beet sugar factories

Cost information notes: Excludes Boiler equipment external works. Adjustments may have to be made for variations found. Also Refer to Rating Manual: Section 5a: Valuation of all property classes: Beet sugar factories

Rateable element: Refer to Rating Manual: Section 5a: Valuation of all property classes: Beet sugar factories

Non-rateable element: Refer to Rating Manual: Section 5a: Valuation of all property classes: Beet sugar factories

Adjusted plant and machinery: External works, standby generators, boilers, oil storage tanks and chimney. Also Refer to Rating Manual: Section 5a: Valuation of all property classes: Beet sugar factories

Number of items adjusted: Refer to Rating Manual: Section 5a: Valuation of all property classes: Beet sugar factories

Contract size adjustment: See Appendix BEAMS Note 2

Description: The building is a typical detached Mess building with kitchen, serving area, dining room/tea bar, toilets, conference, training room, first aid, consulting and treatment rooms. Building Construction most commonly found is reinforced concrete strip foundations with concrete ground slab with cavity brick/insulated concrete block external walls. The roof may be either a concrete or timber framed felted flat roof or in some case pitched roof with concrete roof tiles. The doors and windows are likely to be UPVC double glazed units but at older works traditional wooden or metal casement windows may still be found. Internal walls will be either single concrete block with plaster skimmed finish or plasterboard stud partitions with softwood doors and frames. The internal finish normally found will be emulsion paint to plastered walls and ceilings, vinyl flooring to wet areas and an epoxy resin floor screed in food preparation areas. The remaining internal areas can be floored with vinyl or carpet. Building services will include full gas central heating to steel panel radiators, air supply and extract system, general lighting and power, fire alarms, emergency lighting, reasonable standard of sanitary appliances.

Description: The building is a typical detached internal building with kitchen, serving area, dining room/tea bar, toilets, conference, training room, first aid, consulting and treatment rooms. Internal building, typical construction. External Walls: Timber framed with sheet material cladding, including sound absorption materials and plasterboard inner face. Windows and Doors: Extensive double or triple glazed upvc for insulation both for sound and heat protection. Half glazed door. Internal Walls: Timber stud partitions. Internal Finishes: Emulsion paint to plastered walls and acoustic tile ceilings, and vinyl floor tiles. Building Services: - General lighting and extra power sockets for equipment; heating; air conditioning; fire alarms and emergency lighting, sprinklers. These are for single internal structures within an existing building. Variations may include brick walls, timber windows, raised access floors, soft floor coverings and built between storey heights. Usually constructed as single concrete block or stud partition walling with a timber frame flat roof. Internally painted walls. Building services will include electrical power and lighting.

Superseded codes: -

Location factor: Location Adjustment Applicable (See Guidance Notes) - ERC = UK mean of 1.00

Description: Canopies usually are extensions or attached to existing buildings for the purpose of providing shelter whilst loads are transferred. They may be cantilevered from the side of the building or simply supported on columns. Usually they will be roofed with a profiled metal deck system with guttering. They may be partially enclosed on one or more sides.

Referencing details: GIA - noting degree of enclosure. Also Refer to Rating Manual: Section 5a: Valuation of all property classes: Beet sugar factories

Cost information notes: Lighting costs are included. - Also Refer to Rating Manual: Section 5a: Valuation of all property classes: Beet sugar factories

Rateable element: Refer to Rating Manual: Section 5a: Valuation of all property classes: Beet sugar factories

Non-rateable element: Refer to Rating Manual: Section 5a: Valuation of all property classes: Beet sugar factories

Adjusted plant and machinery: Refer to Rating Manual: Section 5a: Valuation of all property classes: Beet sugar factories

Number of items adjusted: Refer to Rating Manual: Section 5a: Valuation of all property classes: Beet sugar factories

Contract size adjustment: See Appendix BEAMS Note 2

Variations: Where canopies are partially enclosed add costs from Walls, External Sheet cladding or if the enclosure is more in the nature of a building consider using an industrial building cost applicable to the size and construction. Additions Loading platforms; concrete

or brick walls (225mm) with reinforced concrete top slab (250mm) for access of fork lifts etc. Height at 1.2m above floor level- edges with protective strips of solid rubber or similar.

Location factor: Location Adjustment Applicable (See Guidance Notes) - ERC = UK mean of 1.00

Description: Outdoor pool to community standard based on a 25m x 10.50m pool with depth ranging from 0.9m in shallow end to 1.5m in deep end. Excludes diving area. Includes 2m pool surround, pool drainage and water filtration & treatment plant. Excludes pool heating. Pool constructed of reinforced waterproof concrete slab and walls including bulk excavation and disposal off site on a green field site without abnormal ground conditions. Allowance included for formed duct/scum/ filtration channel. Ceramic tiling to internal surfaces of the pool with walk in steps to comply with guidelines on accessibility. 2m concrete surround with 250mm thickness with ceramic tiling to reduce slippage. Increase rate by 15% for a heated pool. Also please note that the cost will reduce as the pool becomes larger, allow for a reduction of approximately 30% for a 50m x 12.50m pool.

Referencing details: Surface area of the pool. Please note the rate includes a 2m wide pool surround, which should not be included in the area for calculating hardstanding/paving.

Descriptive: Changing rooms, office ,stores, staff facilities & snack bar (Shell only)

Tech 1: -

Tech 2: -

Unit size: -

Unit of measurement: m2

ERC: £1,547

Superseded codes: -

Location factor: Location Adjustment Applicable (See Guidance Notes) - ERC = UK mean of 1.00

Description: Changing facilities & other accommodation. Strip foundations, cavity walls, timber roof with clay interlocking tiles fixed via battens and roofing felt to timber trussed rafters at 450mm centres. Roof void insulated with quilt. UPVC rainwater goods. Softwood internal doors. Aluminium windows and doors externally. Finishes to changing area : Ceramic Tiling to walls & floor. Ceiling finish : Moisture resistant plasterboard with a painted finish. Finishes to snack bar, pay kiosk & Office. Fair finished painted blockwork to walls, painted plasterboard soffit, vinyl safety floor including coved skirtings.

Referencing details: Please note this is a modern day equivalent cost thus there are specification changes. Cavity walls utilising facing bricks are provided in lieu of 100mm rendered block to all accommodation, the roof will incorporate additional building regulation requirements for thermal properties. Internal finishes are now provided to the facilities. Modesty lobbies have been included in the changing block as opposed to exiting from the poolside. Specification in line with Sport England with the exception of ceramic tiling to changing room walls due to facilities being wet as opposed to dry.

Cost information notes: A small number of cubicles are provided within the changing areas. Cost excludes fixtures, fittings & equipment and external works. With the exception of the snack bar, the cost for drainage, water installation & heating to all of the premises is included within the plant room code : 63Z00U. The snack bar has an allowance for drainage and water as it will require a dedicated supply.

Tanks

CG Code: 215A10

Specific: Large vertical

Descriptive: Refinery and Chemical works

Tech 1: Fixed head

Tech 2: 2500m³

Unit size: -

Unit of measurement: m3

ERC: £204

Superseded codes: -

Location factor: Considered Not Applicable at time of Publication

Description: Large Vertical Cylindrical - Refinery or Large Petro chemical works floating head tanks found on refineries or large chemical works are generally all steel construction (usually mild steel) with butt-welded shells and tap welded bottoms and roofs. Pre- formed tank sections are laid out on-site and erected over a period of days. The tank sections have usually been treated (painted) with tank manufacturers rust prohibited coat. It is assumed that these tanks are located on Petrol Refineries and Petrochemical Works where crude, semi crude and aggressive materials are common. Unlike tanks on commercial tank farms where specific materials are stored and the tank is designed accordingly, many of the Refinery / Chemical type tanks have, over a period of time, stored a variety of products, some aggressive, resulting in a more rapid deterioration of the tank. The allowance scales (see Guidance Notes) reflect this worst case scenario. The tanks are of basic construction having capacities of up to 120,000 cu. m. (100,000 cubic metres = approx. 22 million UK gallons). In the assumed locations these tanks are used mainly for bulk storage of crude petroleum, semi processed petroleum products and by-products. Few tanks of this size have been erected in the UK since 2000. The tankage on such hereditaments contains petrochemical products, which in the main are crude, or part processed, although some tanks will contain processed products, which are waiting for distribution. Generally the products contained within such tankage is, due partly to its water content and chemical composition, aggressive and variable in its quality, thus causing problems due to chemical reactions in respect of internal corrosion. Most tanks in this size band are floating head tanks especially where there are large volumes of volatile gases present. Many of the pre 1980 tanks were very basic in design and the materials used were the lower end of the regulatory standard. Therefore the result of storing this type of product is a shorter tank life and a more demanding maintenance programme. (See allowance scales). Within Refineries and Large Petro-Chemical properties a variety of tank sizes can be found for refined products awaiting distribution. For tanks under 25,000 cu m scales 215W - - series should be used where the tank is specifically designed for the product it holds. (As the Commercial Tanks Farms). The

stored products are usually for volatile, high flash point products such as gas oil, lubricating oil and fuel oil. The tanks are operated at atmospheric pressure under a floating head. Floating roofs sit on the liquid and rise and fall as volume increases / decreases. Foundations under the tanks base plate are bit-sand foundations (see separate Description Notes on bit-sand foundations and costs). The bit-sand base usually sits on an over site concrete base (e.g. 150mm). Deeper or piled foundations should be costed separately. Tanks other than for petroleum products may have other features not included above (see appropriate code series 215W --). Maintenance cycle - The tanks are usually on a 10-year maintenance cycle, which means an internal inspection takes place every 8 to 12 years. The initial inspection usually requires maintenance and repair of bottom plate holes or areas where the steel is being attacked. (This is usually regarded as maintenance). On the second inspection after 16 to 22 years there is often serious damage to the base plate which may result in renewal of large areas of the base plate or in severe cases total replacement. (This is usually regarded as repair). If renewal is required the tank can be out of commission for up to 6 months. This could lead to the tank being taken out of assessment. When the tank is re commissioned the allowance scales should be adjusted: See: Tank allowance scale Cost Information Notes re - notional age. Painting Internally. More modern tanks may have internal paint coats to prevent such aggressive oils and chemicals from attacking the mild steel plate. For cost information see appropriate scales. All steel base plates on erected tanks are assumed to be painted with a primer to prevent initial rusting. In some cases this painting is not undertaken if specified by the occupier. Painting Externally: - These Costs assume the tank has been painted to refinery tank standards. The assumption is that the tanks on refineries and petrochemical works are subject to a 10-year maintenance cycle and the allowance scales for tanks reflects this type of regime. The tanks are assumed to be painted with a product that will last a maintenance period (average 10 years) and the costs reflect this type of paint specification. Foundations for most tanks sit on a bit-sand foundation (see separate Description and costings). Most bulk storage tanks are built with a cone up centre however some tanks have a sump in the centre of the tank. In the usual cone up situation any pile or slab foundations to the tank should be established by reference to plans and sections and costed with reference to BEAMS. For piled and thicker raft foundations under the tank further additions will be required and these should be calculated with reference to the relevant section in the Cost Guide. Included costs in the bit sand base are: The usual earth foundation requires: (i) Site cleared of vegetable matter, (ii) Compacted chemically inert fill, (iii) Drainage layer 150mm thick of stable permeable compacted granular construction, (iv) 50 mm thick bitumen/sand (Bit sand) layer (laid to correct falls). Drainage, periphery details and sizes are set out in BS 2654 (see fig 35). In all cases cost additions are required for bit-sand bases. (See separate table).

Referencing details: 1. Diameter of tank. 2. Height of tank. 3. Material tank is made out of and whether welded or bolted plates. 4. Painting. 5. Any other known features - internally lined etc. 6. Fixed or Floating Head. 7. Age.

Cost information notes: These costs include external painting. Costs do not include for bitsand foundations, concrete and/or concrete - pile foundations, heating coils, insulation (rock wool), linings (butyl), structural stairways, catwalks, between tank walkways, etc. Further additions: - It is assumed that the outside of the tank is painted with a general long

life paint and the internal tank is painted with a holding primer - for internal painting costs see 215X series.

Rateable element: Class 4, Table 4 Class 2 (d) Draining ; (e) Supplying Water ; (f) Protection from hazards. List of accessories 1 and 2 (v)

Non-rateable element: If under Class 2, whole if Class 2 provisos applies - other than. If under Class 4 Heating coils, rock wool insulation, paddles. Whole if Class 4 (d)

Adjusted plant and machinery: Foundations, catwalks, bunds, structural staircases, piles, fire protection equipment, high-level walkways.

Number of items adjusted: The item can typically be found on an industrial, commercial or office complex. Some hereditaments may have multiple items, in which case the ERC needs to reflect the number of items.

Contract size adjustment: See Appendix BEAMS Note 1

(100,000 cubic metres = approx. 22 million UK gallons). In the assumed locations these tanks are used mainly for bulk storage of crude petroleum, semi processed petroleum products and by-products. Few tanks of this size have been erected in the UK since 2000. The tankage on such hereditaments contains petrochemical products, which in the main are crude, or part processed, although some tanks will contain processed products, which are waiting for distribution. Generally the products contained within such tankage is, due partly to its water content and chemical composition, aggressive and variable in its quality, thus causing problems due to chemical reactions in respect of internal corrosion. Most tanks in this size band are floating head tanks especially where there are large volumes of volatile gases present. Many of the pre 1980 tanks were very basic in design and the materials used were the lower end of the regulatory standard. Therefore the result of storing this type of product is a shorter tank life and a more demanding maintenance programme. (See allowance scales). Within Refineries and Large Petro-Chemical properties a variety of tank sizes can be found for refined products awaiting distribution. For tanks under 25,000 cu m scales 215W - - series should be used where the tank is specifically designed for the product it holds. (As the Commercial Tanks Farms). The stored products are usually for volatile, high flash point products such as gas oil, lubricating

oil and fuel oil. The tanks are operated at atmospheric pressure under a floating head. Floating roofs sit on the liquid and rise and fall as volume increases / decreases. Foundations under the tanks base plate are bit-sand foundations (see separate Description Notes on bit-sand foundations and costs). The bit-sand base usually sits on an over site concrete base (e.g. 150mm). Deeper or piled foundations should be costed separately. Tanks other than for petroleum products may have other features not included above (see appropriate code series 215W --). Maintenance cycle - The tanks are usually on a 10-year maintenance cycle, which means an internal inspection takes place every 8 to 12 years. The initial inspection usually requires maintenance and repair of bottom plate holes or areas where the steel is being attacked. (This is usually regarded as maintenance). On the second inspection after 16 to 22 years there is often serious damage to the base plate which may result in renewal of large areas of the base plate or in severe cases total replacement. (This is usually regarded as repair). If renewal is required the tank can be out of commission for up to 6 months. This could lead to the tank being taken out of assessment. When the tank is re commissioned the allowance scales should be adjusted: See: Tank allowance scale Cost Information Notes re - notional age. Painting Internally. More modern tanks may have internal paint coats to prevent such aggressive oils and chemicals from attacking the mild steel plate. For cost information see appropriate scales. All steel base plates on erected tanks are assumed to be painted with a primer to prevent initial rusting. In some cases this painting is not undertaken if specified by the occupier. Painting Externally: - These Costs assume the tank has been painted to refinery tank standards. The assumption is that the tanks on refineries and petrochemical works are subject to a 10-year maintenance cycle and the allowance scales for tanks reflects this type of regime. The tanks are assumed to be painted with a product that will last a maintenance period (average 10 years) and the costs reflect this type of paint specification. Foundations for most tanks sit on a bit-sand foundation (see separate Description and costings). Most bulk storage tanks are built with a cone up centre however some tanks have a sump in the centre of the tank. In the usual cone up situation any pile or slab foundations to the tank should be established by reference to plans and sections and costed with reference to BEAMS. For piled and thicker raft foundations under the tank further additions will be required and these should be calculated with reference to the relevant section in the Cost Guide. Included costs in the bit sand base are: The usual earth foundation requires: (i) Site cleared of vegetable matter, (ii) Compacted chemically inert fill, (iii) Drainage layer 150mm thick of stable permeable compacted granular construction, (iv) 50 mm thick bitumen/sand (Bit sand) layer (laid to correct falls). Drainage, periphery details and sizes are set out in BS 2654 (see fig 35). In all cases cost additions are required for bit-sand bases. (See separate table).

Referencing details: 1. Diameter of tank. 2. Height of tank. 3. Material tank is made out of and whether welded or bolted plates. 4. Painting. 5. Any other known features - internally lined etc. 6. Fixed or Floating Head. 7. Age.

Cost information notes: These costs include external painting. Costs do not include for bitsand foundations, concrete and/or concrete - pile foundations, heating coils, insulation (rock wool), linings (butyl), structural stairways, catwalks, between tank walkways, etc. Further additions: - It is assumed that the outside of the tank is painted with a general long

life paint and the internal tank is painted with a holding primer - for internal painting costs see 215X series.

Rateable element: Class 4, Table 4 Class 2 (d) Draining ; (e) Supplying Water ; (f) Protection from hazards. List of accessories 1 and 2 (v)

Non-rateable element: If under Class 2, whole if Class 2 provisos applies - other than. If under Class 4 Heating coils, rock wool insulation, paddles. Whole if Class 4 (d)

Adjusted plant and machinery: Foundations, catwalks, bunds, structural staircases, piles, fire protection equipment, high-level walkways.

Number of items adjusted: The item can typically be found on an industrial, commercial or office complex. Some hereditaments may have multiple items, in which case the ERC needs to reflect the number of items.

Contract size adjustment: See Appendix BEAMS Note 1

Description: Large Vertical Cylindrical - Refinery or Large Petro chemical works floating head tanks found on refineries or large chemical works are generally all steel construction (usually mild steel) with butt-welded shells and tap welded bottoms and roofs. Pre- formed tank sections are laid out on-site and erected over a period of days. The tank sections have usually been treated (painted) with tank manufacturers rust prohibited coat. It is assumed that these tanks are located on Petrol Refineries and Petrochemical Works where crude, semi crude and aggressive materials are common. Unlike tanks on commercial tank farms where specific materials are stored and the tank is designed accordingly, many of the Refinery / Chemical type tanks have, over a period of time, stored a variety of products, some aggressive, resulting in a more rapid deterioration of the tank. The allowance scales (see Guidance Notes) reflect this worst case scenario. The tanks are of basic construction having capacities of up to 120,000 cu. m. (100,000 cubic metres = approx. 22 million UK gallons). In the assumed locations these tanks are used mainly for bulk storage of crude petroleum, semi processed petroleum products and by-products. Few tanks of this size have been erected in the UK since 2000. The tankage on such hereditaments contains petrochemical products, which in the main are crude, or part processed, although some tanks will contain processed products, which are waiting for distribution. Description: Large Vertical Cylindrical - Refinery or Large Petro chemical works floating head tanks found on refineries or large chemical works are generally all steel construction (usually mild steel) with butt-welded shells and tap welded bottoms and roofs. Pre- formed tank sections are laid out on-site and erected over a period of days. The tank sections have usually been treated (painted) with tank manufacturers rust prohibited coat. It is assumed that these tanks are located on Petrol Refineries and Petrochemical Works where crude, semi crude and aggressive materials are common. Unlike tanks on commercial tank farms where specific materials are stored and the tank is designed accordingly, many of the Refinery / Chemical type tanks have, over a period of time, stored a variety of products, some aggressive, resulting in a more rapid deterioration of the tank. The allowance scales (see Guidance Notes) reflect this worst case scenario. The tanks are of basic construction having capacities of up to 120,000 cu. m. (100,000 cubic metres = approx. 22 million UK gallons). In the assumed locations these tanks are used mainly for bulk storage of crude petroleum, semi processed petroleum products and by-products. Few tanks of this size have been erected in the UK since 2000. The tankage on such hereditaments contains petrochemical products, which in the main are crude, or part processed, although some tanks will contain processed products, which are waiting for distribution. Generally the products contained within such tankage is, due partly to its water content and chemical composition, aggressive and variable in its quality, thus causing problems due to chemical reactions in respect of internal corrosion. Most tanks in this size band are floating head tanks especially where there are large volumes of volatile gases present. Many of the pre 1980 tanks were very basic in design and the materials used were the lower end of the regulatory standard. Therefore the result of storing this type of product is a shorter tank life and a more demanding maintenance programme. (See allowance scales). Within Refineries and Large Petro-Chemical properties a variety of tank sizes can be found for refined products awaiting distribution. For tanks under 25,000 cu m scales 215W - - series should be used where the tank is specifically designed for the product it holds. (As the Commercial Tanks Farms). The stored products are usually for volatile, high flash point products such as gas oil, lubricating

oil and fuel oil. The tanks are operated at atmospheric pressure under a floating head. Floating roofs sit on the liquid and rise and fall as volume increases / decreases. Foundations under the tanks base plate are bit-sand foundations (see separate Description Notes on bit-sand foundations and costs). The bit-sand base usually sits on an over site concrete base (e.g. 150mm). Deeper or piled foundations should be costed separately. Tanks other than for petroleum products may have other features not included above (see appropriate code series 215W --). Maintenance cycle - The tanks are usually on a 10-year maintenance cycle, which means an internal inspection takes place every 8 to 12 years. The initial inspection usually requires maintenance and repair of bottom plate holes or areas where the steel is being attacked. (This is usually regarded as maintenance). On the second inspection after 16 to 22 years there is often serious damage to the base plate which may result in renewal of large areas of the base plate or in severe cases total replacement. (This is usually regarded as repair). If renewal is required the tank can be out of commission for up to 6 months. This could lead to the tank being taken out of assessment. When the tank is re commissioned the allowance scales should be adjusted: See: Tank allowance scale Cost Information Notes re - notional age. Painting Internally. More modern tanks may have internal paint coats to prevent such aggressive oils and chemicals from attacking the mild steel plate. For cost information see appropriate scales. All steel base plates on erected tanks are assumed to be painted with a primer to prevent initial rusting. In some cases this painting is not undertaken if specified by the occupier. Painting Externally: - These Costs assume the tank has been painted to refinery tank standards. The assumption is that the tanks on refineries and petrochemical works are subject to a 10-year maintenance cycle and the allowance scales for tanks reflects this type of regime. The tanks are assumed to be painted with a product that will last a maintenance period (average 10 years) and the costs reflect this type of paint specification. Foundations for most tanks sit on a bit-sand foundation (see separate Description and costings). Most bulk storage tanks are built with a cone up centre however some tanks have a sump in the centre of the tank. In the usual cone up situation any pile or slab foundations to the tank should be established by reference to plans and sections and costed with reference to BEAMS. For piled and thicker raft foundations under the tank further additions will be required and these should be calculated with reference to the relevant section in the Cost Guide. Included costs in the bit sand base are: The usual earth foundation requires: (i) Site cleared of vegetable matter, (ii) Compacted chemically inert fill, (iii) Drainage layer 150mm thick of stable permeable compacted granular construction, (iv) 50 mm thick bitumen/sand (Bit sand) layer (laid to correct falls). Drainage, periphery details and sizes are set out in BS 2654 (see fig 35). In all cases cost additions are required for bit-sand bases. (See separate table).

Referencing details: 1. Diameter of tank. 2. Height of tank. 3. Material tank is made out of and whether welded or bolted plates. 4. Painting. 5. Any other known features - internally lined etc. 6. Fixed or Floating Head. 7. Age.

Cost information notes: These costs include external painting. Costs do not include for bitsand foundations, concrete and/or concrete - pile foundations, heating coils, insulation (rock wool), linings (butyl), structural stairways, catwalks, between tank walkways, etc. Further additions: - It is assumed that the outside of the tank is painted with a general long

life paint and the internal tank is painted with a holding primer - for internal painting costs see 215X series.

Rateable element: Class 4, Table 4 Class 2 (d) Draining ; (e) Supplying Water ; (f) Protection from hazards. List of accessories 1 and 2 (v)

Non-rateable element: If under Class 2, whole if Class 2 provisos applies - other than. If under Class 4 Heating coils, rock wool insulation, paddles. Whole if Class 4 (d)

Adjusted plant and machinery: Foundations, catwalks, bunds, structural staircases, piles, fire protection equipment, high-level walkways.

Number of items adjusted: The item can typically be found on an industrial, commercial or office complex. Some hereditaments may have multiple items, in which case the ERC needs to reflect the number of items.

Description: Large Vertical Cylindrical - Refinery or Large Petro chemical works floating head tanks found on refineries or large chemical works are generally all steel construction (usually mild steel) with butt-welded shells and tap welded bottoms and roofs. Pre- formed tank sections are laid out on-site and erected over a period of days. The tank sections have usually been treated (painted) with tank manufacturers rust prohibited coat. It is assumed that these tanks are located on Petrol Refineries and Petrochemical Works where crude, semi crude and aggressive materials are common. Unlike tanks on commercial tank farms where specific materials are stored and the tank is designed accordingly, many of the Refinery / Chemical type tanks have, over a period of time, stored a variety of products, some aggressive, resulting in a more rapid deterioration of the tank. The allowance scales (see Guidance Notes) reflect this worst case scenario. The tanks are of basic construction having capacities of up to 120,000 cu. m. (100,000 cubic metres = approx. 22 million UK gallons). In the assumed locations these tanks are used mainly for bulk storage of crude petroleum, semi processed petroleum products and by-products. Few tanks of this size have been erected in the UK since 2000. The tankage on such hereditaments contains petrochemical products, which in the main are crude, or part processed, although some tanks will contain processed products, which are waiting for distribution. Generally the products contained within such tankage is, due partly to its water content and chemical composition, aggressive and variable in its quality, thus causing problems due to chemical reactions in respect of internal corrosion. Most tanks in this size band are floating head tanks especially where there are large volumes of volatile gases present. Many of the pre 1980 tanks were very basic in design and the materials used were the lower end of the regulatory standard. Therefore the result of storing this type of product is a shorter tank life and a more demanding maintenance programme. (See allowance scales). Within Refineries and Large Petro-Chemical properties a variety of tank sizes can be found for refined products awaiting distribution. For tanks under 25,000 cu m scales 215W - - series should be used where the tank is specifically designed for the product it holds. (As the Commercial Tanks Farms). The stored products are usually for volatile, high flash point products such as gas oil, lubricating

oil and fuel oil. The tanks are operated at atmospheric pressure under a floating head. Floating roofs sit on the liquid and rise and fall as volume increases / decreases. Foundations under the tanks base plate are bit-sand foundations (see separate Description Notes on bit-sand foundations and costs). The bit-sand base usually sits on an over site concrete base (e.g. 150mm). Deeper or piled foundations should be costed separately. Tanks other than for petroleum products may have other features not included above (see appropriate code series 215W --). Maintenance cycle - The tanks are usually on a 10-year maintenance cycle, which means an internal inspection takes place every 8 to 12 years. The initial inspection usually requires maintenance and repair of bottom plate holes or areas where the steel is being attacked. (This is usually regarded as maintenance). On the second inspection after 16 to 22 years there is often serious damage to the base plate which may result in renewal of large areas of the base plate or in severe cases total replacement. (This is usually regarded as repair). If renewal is required the tank can be out of commission for up to 6 months. This could lead to the tank being taken out of assessment. When the tank is re commissioned the allowance scales should be adjusted: See: Tank allowance scale Cost Information Notes re - notional age. Painting Internally. More modern tanks may have internal paint coats to prevent such aggressive oils and chemicals from attacking the mild steel plate. For cost information see appropriate scales. All steel base plates on erected tanks are assumed to be painted with a primer to prevent initial rusting. In some cases this painting is not undertaken if specified by the occupier. Painting Externally: - These Costs assume the tank has been painted to refinery tank standards. The assumption is that the tanks on refineries and petrochemical works are subject to a 10-year maintenance cycle and the allowance scales for tanks reflects this type of regime. The tanks are assumed to be painted with a product that will last a maintenance period (average 10 years) and the costs reflect this type of paint specification. Foundations for most tanks sit on a bit-sand foundation (see separate Description and costings). Most bulk storage tanks are built with a cone up centre however some tanks have a sump in the centre of the tank. In the usual cone up situation any pile or slab foundations to the tank should be established by reference to plans and sections and costed with reference to BEAMS. For piled and thicker raft foundations under the tank further additions will be required and these should be calculated with reference to the relevant section in the Cost Guide. Included costs in the bit sand base are: The usual earth foundation requires: (i) Site cleared of vegetable matter, (ii) Compacted chemically inert fill, (iii) Drainage layer 150mm thick of stable permeable compacted granular construction, (iv) 50 mm thick bitumen/sand (Bit sand) layer (laid to correct falls). Drainage, periphery details and sizes are set out in BS 2654 (see fig 35). In all cases cost additions are required for bit-sand bases. (See separate table).

Referencing details: 1. Diameter of tank. 2. Height of tank. 3. Material tank is made out of and whether welded or bolted plates. 4. Painting. 5. Any other known features - internally lined etc. 6. Fixed or Floating Head. 7. Age.

Cost information notes: These costs include external painting. Costs do not include for bitsand foundations, concrete and/or concrete - pile foundations, heating coils, insulation (rock wool), linings (butyl), structural stairways, catwalks, between tank walkways, etc. Further additions: - It is assumed that the outside of the tank is painted with a general long

life paint and the internal tank is painted with a holding primer - for internal painting costs see 215X series.

Rateable element: Class 4, Table 4 Class 2 (d) Draining ; (e) Supplying Water ; (f) Protection from hazards. List of accessories 1 and 2 (v)

Non-rateable element: If under Class 2, whole if Class 2 provisos applies - other than. If under Class 4 Heating coils, rock wool insulation, paddles. Whole if Class 4 (d)

Adjusted plant and machinery: Foundations, catwalks, bunds, structural staircases, piles, fire protection equipment, high-level walkways.

Number of items adjusted: The item can typically be found on an industrial, commercial or office complex. Some hereditaments may have multiple items, in which case the ERC needs to reflect the number of items.

Contract size adjustment: See Appendix BEAMS Note 1

Location factor: Considered Not Applicable at time of Publication

Description: Large Vertical Cylindrical - Refinery or Large Petro chemical works floating head tanks found on refineries or large chemical works are generally all steel construction (usually mild steel) with butt-welded shells and tap welded bottoms and roofs. Pre- formed tank sections are laid out on-site and erected over a period of days. The tank sections have usually been treated (painted) with tank manufacturers rust prohibited coat. It is assumed that these tanks are located on Petrol Refineries and Petrochemical Works where crude, semi crude and aggressive materials are common. Unlike tanks on commercial tank farms where specific materials are stored and the tank is designed accordingly, many of the Refinery / Chemical type tanks have, over a period of time, stored a variety of products, some aggressive, resulting in a more rapid deterioration of the tank. The allowance scales (see Guidance Notes) reflect this worst case scenario. The tanks are of basic construction having capacities of up to 120,000 cu. m. (100,000 cubic metres = approx. 22 million UK gallons). In the assumed locations these tanks are used mainly for bulk storage of crude petroleum, semi processed petroleum products and by-products. Few tanks of this size have been erected in the UK since 2000. The tankage on such hereditaments contains petrochemical products, which in the main are crude, or part processed, although some tanks will contain processed products, which are waiting for distribution. Generally the products contained within such tankage is, due partly to its water content and chemical composition, aggressive and variable in its quality, thus causing problems due to chemical reactions in respect of internal corrosion. Most tanks in this size band are floating head tanks especially where there are large volumes of volatile gases present. Many of the pre 1980 tanks were very basic in design and the materials used were the lower end of the regulatory standard. Therefore the result of storing this type of product is a shorter tank life and a more demanding maintenance programme. (See allowance scales). Within Refineries and Large Petro-Chemical properties a variety of tank sizes can be found for refined products awaiting distribution. For tanks under 25,000 cu m scales 215W - - series should be used where the tank is specifically designed for the product it holds. (As the Commercial Tanks Farms). The stored products are usually for volatile, high flash point products such as gas oil, lubricating

oil and fuel oil. The tanks are operated at atmospheric pressure under a floating head. Floating roofs sit on the liquid and rise and fall as volume increases / decreases. Foundations under the tanks base plate are bit-sand foundations (see separate Description Notes on bit-sand foundations and costs). The bit-sand base usually sits on an over site concrete base (e.g. 150mm). Deeper or piled foundations should be costed separately. Tanks other than for petroleum products may have other features not included above (see appropriate code series 215W --). Maintenance cycle - The tanks are usually on a 10-year maintenance cycle, which means an internal inspection takes place every 8 to 12 years. The initial inspection usually requires maintenance and repair of bottom plate holes or areas where the steel is being attacked. (This is usually regarded as maintenance). On the second inspection after 16 to 22 years there is often serious damage to the base plate which may result in renewal of large areas of the base plate or in severe cases total replacement. (This is usually regarded as repair). If renewal is required the tank can be out of commission for up to 6 months. This could lead to the tank being taken out of assessment. When the tank is re commissioned the allowance scales should be adjusted: See: Tank allowance scale Cost Information Notes re - notional age. Painting Internally. More modern tanks may have internal paint coats to prevent such aggressive oils and chemicals from attacking the mild steel plate. For cost information see appropriate scales. All steel base plates on erected tanks are assumed to be painted with a primer to prevent initial rusting. In some cases this painting is not undertaken if specified by the occupier. Painting Externally: - These Costs assume the tank has been painted to refinery tank standards. The assumption is that the tanks on refineries and petrochemical works are subject to a 10-year maintenance cycle and the allowance scales for tanks reflects this type of regime. The tanks are assumed to be painted with a product that will last a maintenance period (average 10 years) and the costs reflect this type of paint specification. Foundations for most tanks sit on a bit-sand foundation (see separate Description and costings). Most bulk storage tanks are built with a cone up centre however some tanks have a sump in the centre of the tank. In the usual cone up situation any pile or slab foundations to the tank should be established by reference to plans and sections and costed with reference to BEAMS. For piled and thicker raft foundations under the tank further additions will be required and these should be calculated with reference to the relevant section in the Cost Guide. Included costs in the bit sand base are: The usual earth foundation requires: (i) Site cleared of vegetable matter, (ii) Compacted chemically inert fill, (iii) Drainage layer 150mm thick of stable permeable compacted granular construction, (iv) 50 mm thick bitumen/sand (Bit sand) layer (laid to correct falls). Drainage, periphery details and sizes are set out in BS 2654 (see fig 35). In all cases cost additions are required for bit-sand bases. (See separate table).

Referencing details: 1. Diameter of tank. 2. Height of tank. 3. Material tank is made out of and whether welded or bolted plates. 4. Painting. 5. Any other known features - internally lined etc. 6. Fixed or Floating Head. 7. Age.

Cost information notes: These costs include external painting. Costs do not include for bitsand foundations, concrete and/or concrete - pile foundations, heating coils, insulation (rock wool), linings (butyl), structural stairways, catwalks, between tank walkways, etc. Further additions: - It is assumed that the outside of the tank is painted with a general long

life paint and the internal tank is painted with a holding primer - for internal painting costs see 215X series.

Rateable element: Class 4, Table 4 Class 2 (d) Draining ; (e) Supplying Water ; (f) Protection from hazards. List of accessories 1 and 2 (v)

Non-rateable element: If under Class 2, whole if Class 2 provisos applies - other than. If under Class 4 Heating coils, rock wool insulation, paddles. Whole if Class 4 (d)

Adjusted plant and machinery: Foundations, catwalks, bunds, structural staircases, piles, fire protection equipment, high-level walkways.

Number of items adjusted: The item can typically be found on an industrial, commercial or office complex. Some hereditaments may have multiple items, in which case the ERC needs to reflect the number of items.

Contract size adjustment: See Appendix BEAMS Note 1

Descriptive: Refinery and Chemical works

Tech 1: Fixed head

Tech 2: 13000m³

Unit size: Per cubic metre

Unit of measurement: m3

ERC: £103

Superseded codes: -

Location factor: Considered Not Applicable at time of Publication

Description: Large Vertical Cylindrical - Refinery or Large Petro chemical works floating head tanks found on refineries or large chemical works are generally all steel construction (usually mild steel) with butt-welded shells and tap welded bottoms and roofs. Pre- formed tank sections are laid out on-site and erected over a period of days. The tank sections have usually been treated (painted) with tank manufacturers rust prohibited coat. It is assumed that these tanks are located on Petrol Refineries and Petrochemical Works where crude, semi crude and aggressive materials are common. Unlike tanks on commercial tank farms where specific materials are stored and the tank is designed accordingly, many of the Refinery / Chemical type tanks have, over a period of time, stored a variety of products, some aggressive, resulting in a more rapid deterioration of the tank. The allowance scales (see Guidance Notes) reflect this worst case scenario. The tanks are of basic construction having capacities of up to 120,000 cu. m. (100,000 cubic metres = approx. 22 million UK gallons). In the assumed locations these tanks are used mainly for bulk storage of crude petroleum, semi processed petroleum products and by-products. Few tanks of this size have been erected in the UK since 2000. The tankage on such hereditaments contains petrochemical products, which in the main are crude, or part processed, although some tanks will contain processed products, which are waiting for distribution. Generally the products contained within such tankage is, due partly to its water content and chemical composition, aggressive and variable in its quality, thus causing problems due to chemical reactions in respect of internal corrosion. Most tanks in this size band are floating head tanks especially where there are large volumes of volatile gases present. Many of the pre 1980 tanks were very basic in design and the materials used were the lower end of the regulatory standard. Therefore the result of storing this type of product is a shorter tank life and a more demanding maintenance programme. (See allowance scales). Within Refineries and Large Petro-Chemical properties a variety of tank sizes can be found for refined products awaiting distribution. For tanks under 25,000 cu m scales 215W - - series should be used where the tank is specifically designed for the product it holds. (As the Commercial Tanks Farms). The stored products are usually for volatile, high flash point products such as gas oil, lubricating

oil and fuel oil. The tanks are operated at atmospheric pressure under a floating head. Floating roofs sit on the liquid and rise and fall as volume increases / decreases. Foundations under the tanks base plate are bit-sand foundations (see separate Description Notes on bit-sand foundations and costs). The bit-sand base usually sits on an over site concrete base (e.g. 150mm). Deeper or piled foundations should be costed separately. Tanks other than for petroleum products may have other features not included above (see appropriate code series 215W --). Maintenance cycle - The tanks are usually on a 10-year maintenance cycle, which means an internal inspection takes place every 8 to 12 years. The initial inspection usually requires maintenance and repair of bottom plate holes or areas where the steel is being attacked. (This is usually regarded as maintenance). On the second inspection after 16 to 22 years there is often serious damage to the base plate which may result in renewal of large areas of the base plate or in severe cases total replacement. (This is usually regarded as repair). If renewal is required the tank can be out of commission for up to 6 months. This could lead to the tank being taken out of assessment. When the tank is re commissioned the allowance scales should be adjusted: See: Tank allowance scale Cost Information Notes re - notional age. Painting Internally. More modern tanks may have internal paint coats to prevent such aggressive oils and chemicals from attacking the mild steel plate. For cost information see appropriate scales. All steel base plates on erected tanks are assumed to be painted with a primer to prevent initial rusting. In some cases this painting is not undertaken if specified by the occupier. Painting Externally: - These Costs assume the tank has been painted to refinery tank standards. The assumption is that the tanks on refineries and petrochemical works are subject to a 10-year maintenance cycle and the allowance scales for tanks reflects this type of regime. The tanks are assumed to be painted with a product that will last a maintenance period (average 10 years) and the costs reflect this type of paint specification. Foundations for most tanks sit on a bit-sand foundation (see separate Description and costings). Most bulk storage tanks are built with a cone up centre however some tanks have a sump in the centre of the tank. In the usual cone up situation any pile or slab foundations to the tank should be established by reference to plans and sections and costed with reference to BEAMS. For piled and thicker raft foundations under the tank further additions will be required and these should be calculated with reference to the relevant section in the Cost Guide. Included costs in the bit sand base are: The usual earth foundation requires: (i) Site cleared of vegetable matter, (ii) Compacted chemically inert fill, (iii) Drainage layer 150mm thick of stable permeable compacted granular construction, (iv) 50 mm thick bitumen/sand (Bit sand) layer (laid to correct falls). Drainage, periphery details and sizes are set out in BS 2654 (see fig 35). In all cases cost additions are required for bit-sand bases. (See separate table).

Referencing details: 1. Diameter of tank. 2. Height of tank. 3. Material tank is made out of and whether welded or bolted plates. 4. Painting. 5. Any other known features - internally lined etc. 6. Fixed or Floating Head. 7. Age.

Cost information notes: These costs include external painting. Costs do not include for bitsand foundations, concrete and/or concrete - pile foundations, heating coils, insulation (rock wool), linings (butyl), structural stairways, catwalks, between tank walkways, etc. Further additions: - It is assumed that the outside of the tank is painted with a general long

life paint and the internal tank is painted with a holding primer - for internal painting costs see 215X series.

Rateable element: Class 4, Table 4 Class 2 (d) Draining ; (e) Supplying Water ; (f) Protection from hazards. List of accessories 1 and 2 (v)

Non-rateable element: If under Class 2, whole if Class 2 provisos applies - other than. If under Class 4 Heating coils, rock wool insulation, paddles. Whole if Class 4 (d)

Adjusted plant and machinery: Foundations, catwalks, bunds, structural staircases, piles, fire protection equipment, high-level walkways.

Number of items adjusted: The item can typically be found on an industrial, commercial or office complex. Some hereditaments may have multiple items, in which case the ERC needs to reflect the number of items.

Description: Large Vertical Cylindrical - Refinery or Large Petro chemical works floating head tanks found on refineries or large chemical works are generally all steel construction (usually mild steel) with butt-welded shells and tap welded bottoms and roofs. Pre- formed tank sections are laid out on-site and erected over a period of days. The tank sections have usually been treated (painted) with tank manufacturers rust prohibited coat. It is assumed that these tanks are located on Petrol Refineries and Petrochemical Works where crude, semi crude and aggressive materials are common. Unlike tanks on commercial tank farms where specific materials are stored and the tank is designed accordingly, many of the Refinery / Chemical type tanks have, over a period of time, stored a variety of products, some aggressive, resulting in a more rapid deterioration of the tank. The allowance scales (see Guidance Notes) reflect this worst case scenario. The tanks are of basic construction having capacities of up to 120,000 cu. m. (100,000 cubic metres = approx. 22 million UK gallons). In the assumed locations these tanks are used mainly for bulk storage of crude petroleum, semi processed petroleum products and by-products. Few tanks of this size have been erected in the UK since 2000. The tankage on such hereditaments contains petrochemical products, which in the main are crude, or part processed, although some tanks will contain processed products, which are waiting for distribution. Generally the products contained within such tankage is, due partly to its water content and chemical composition, aggressive and variable in its quality, thus causing problems due to chemical reactions in respect of internal corrosion. Most tanks in this size band are floating head tanks especially where there are large volumes of volatile gases present. Many of the pre 1980 tanks were very basic in design and the materials used were the lower end of the regulatory standard. Therefore the result of storing this type of product is a shorter tank life and a more demanding maintenance programme. (See allowance scales). Within Refineries and Large Petro-Chemical properties a variety of tank sizes can be found for refined products awaiting distribution. For tanks under 25,000 cu m scales 215W - - series should be used where the tank is specifically designed for the product it holds. (As the Commercial Tanks Farms). The stored products are usually for volatile, high flash point products such as gas oil, lubricating

oil and fuel oil. The tanks are operated at atmospheric pressure under a floating head. Floating roofs sit on the liquid and rise and fall as volume increases / decreases. Foundations under the tanks base plate are bit-sand foundations (see separate Description Notes on bit-sand foundations and costs). The bit-sand base usually sits on an over site concrete base (e.g. 150mm). Deeper or piled foundations should be costed separately. Tanks other than for petroleum products may have other features not included above (see appropriate code series 215W --). Maintenance cycle - The tanks are usually on a 10-year maintenance cycle, which means an internal inspection takes place every 8 to 12 years. The initial inspection usually requires maintenance and repair of bottom plate holes or areas where the steel is being attacked. (This is usually regarded as maintenance). On the second inspection after 16 to 22 years there is often serious damage to the base plate which may result in renewal of large areas of the base plate or in severe cases total replacement. (This is usually regarded as repair). If renewal is required the tank can be out of commission for up to 6 months. This could lead to the tank being taken out of assessment. When the tank is re commissioned the allowance scales should be adjusted: See: Tank allowance scale Cost Information Notes re - notional age. Painting Internally. More modern tanks may have internal paint coats to prevent such aggressive oils and chemicals from attacking the mild steel plate. For cost information see appropriate scales. All steel base plates on erected tanks are assumed to be painted with a primer to prevent initial rusting. In some cases this painting is not undertaken if specified by the occupier. Painting Externally: - These Costs assume the tank has been painted to refinery tank standards. The assumption is that the tanks on refineries and petrochemical works are subject to a 10-year maintenance cycle and the allowance scales for tanks reflects this type of regime. The tanks are assumed to be painted with a product that will last a maintenance period (average 10 years) and the costs reflect this type of paint specification. Foundations for most tanks sit on a bit-sand foundation (see separate Description and costings). Most bulk storage tanks are built with a cone up centre however some tanks have a sump in the centre of the tank. In the usual cone up situation any pile or slab foundations to the tank should be established by reference to plans and sections and costed with reference to BEAMS. For piled and thicker raft foundations under the tank further additions will be required and these should be calculated with reference to the relevant section in the Cost Guide. Included costs in the bit sand base are: The usual earth foundation requires: (i) Site cleared of vegetable matter, (ii) Compacted chemically inert fill, (iii) Drainage layer 150mm thick of stable permeable compacted granular construction, (iv) 50 mm thick bitumen/sand (Bit sand) layer (laid to correct falls). Drainage, periphery details and sizes are set out in BS 2654 (see fig 35). In all cases cost additions are required for bit-sand bases. (See separate table).

Referencing details: 1. Diameter of tank. 2. Height of tank. 3. Material tank is made out of and whether welded or bolted plates. 4. Painting. 5. Any other known features - internally lined etc. 6. Fixed or Floating Head. 7. Age.

Cost information notes: These costs include external painting. Costs do not include for bitsand foundations, concrete and/or concrete - pile foundations, heating coils, insulation (rock wool), linings (butyl), structural stairways, catwalks, between tank walkways, etc. Further additions: - It is assumed that the outside of the tank is painted with a general long

life paint and the internal tank is painted with a holding primer - for internal painting costs see 215X series.

Rateable element: Class 4, Table 4 Class 2 (d) Draining ; (e) Supplying Water ; (f) Protection from hazards. List of accessories 1 and 2 (v)

Non-rateable element: If under Class 2, whole if Class 2 provisos applies - other than. If under Class 4 Heating coils, rock wool insulation, paddles. Whole if Class 4 (d)

Adjusted plant and machinery: Foundations, catwalks, bunds, structural staircases, piles, fire protection equipment, high-level walkways.

Number of items adjusted: The item can typically be found on an industrial, commercial or office complex. Some hereditaments may have multiple items, in which case the ERC needs to reflect the number of items.

Contract size adjustment: See Appendix BEAMS Note 1

Tech 1: Fixed head

Tech 2: 20000m³

Unit size: Per cubic metre

Unit of measurement: m3

ERC: £92

Superseded codes: -

Location factor: Considered Not Applicable at time of Publication

Description: Large Vertical Cylindrical - Refinery or Large Petro chemical works floating head tanks found on refineries or large chemical works are generally all steel construction (usually mild steel) with butt-welded shells and tap welded bottoms and roofs. Pre- formed tank sections are laid out on-site and erected over a period of days. The tank sections have usually been treated (painted) with tank manufacturers rust prohibited coat. It is assumed that these tanks are located on Petrol Refineries and Petrochemical Works where crude, semi crude and aggressive materials are common. Unlike tanks on commercial tank farms where specific materials are stored and the tank is designed accordingly, many of the Refinery / Chemical type tanks have, over a period of time, stored a variety of products, some aggressive, resulting in a more rapid deterioration of the tank. The allowance scales (see Guidance Notes) reflect this worst case scenario. The tanks are of basic construction having capacities of up to 120,000 cu. m. (100,000 cubic metres = approx. 22 million UK gallons). In the assumed locations these tanks are used mainly for bulk storage of crude petroleum, semi processed petroleum products and by-products. Few tanks of this size have been erected in the UK since 2000. The tankage on such hereditaments contains petrochemical products, which in the main are crude, or part processed, although some tanks will contain processed products, which are waiting for distribution. Generally the products contained within such tankage is, due partly to its water content and chemical composition, aggressive and variable in its quality, thus causing problems due to chemical reactions in respect of internal corrosion. Most tanks in this size band are floating head tanks especially where there are large volumes of volatile gases present. Many of the pre 1980 tanks were very basic in design and the materials used were the lower end of the regulatory standard. Therefore the result of storing this type of product is a shorter tank life and a more demanding maintenance programme. (See allowance scales). Within Refineries and Large Petro-Chemical properties a variety of tank sizes can be found for refined products awaiting distribution. For tanks under 25,000 cu m scales 215W - - series should be used where the tank is specifically designed for the product it holds. (As the Commercial Tanks Farms). The stored products are usually for volatile, high flash point products such as gas oil, lubricating

oil and fuel oil. The tanks are operated at atmospheric pressure under a floating head. Floating roofs sit on the liquid and rise and fall as volume increases / decreases. Foundations under the tanks base plate are bit-sand foundations (see separate Description Notes on bit-sand foundations and costs). The bit-sand base usually sits on an over site concrete base (e.g. 150mm). Deeper or piled foundations should be costed separately. Tanks other than for petroleum products may have other features not included above (see appropriate code series 215W --). Maintenance cycle - The tanks are usually on a 10-year maintenance cycle, which means an internal inspection takes place every 8 to 12 years. The initial inspection usually requires maintenance and repair of bottom plate holes or areas where the steel is being attacked. (This is usually regarded as maintenance). On the second inspection after 16 to 22 years there is often serious damage to the base plate which may result in renewal of large areas of the base plate or in severe cases total replacement. (This is usually regarded as repair). If renewal is required the tank can be out of commission for up to 6 months. This could lead to the tank being taken out of assessment. When the tank is re commissioned the allowance scales should be adjusted: See: Tank allowance scale Cost Information Notes re - notional age. Painting Internally. More modern tanks may have internal paint coats to prevent such aggressive oils and chemicals from attacking the mild steel plate. For cost information see appropriate scales. All steel base plates on erected tanks are assumed to be painted with a primer to prevent initial rusting. In some cases this painting is not undertaken if specified by the occupier. Painting Externally: - These Costs assume the tank has been painted to refinery tank standards. The assumption is that the tanks on refineries and petrochemical works are subject to a 10-year maintenance cycle and the allowance scales for tanks reflects this type of regime. The tanks are assumed to be painted with a product that will last a maintenance period (average 10 years) and the costs reflect this type of paint specification. Foundations for most tanks sit on a bit-sand foundation (see separate Description and costings). Most bulk storage tanks are built with a cone up centre however some tanks have a sump in the centre of the tank. In the usual cone up situation any pile or slab foundations to the tank should be established by reference to plans and sections and costed with reference to BEAMS. For piled and thicker raft foundations under the tank further additions will be required and these should be calculated with reference to the relevant section in the Cost Guide. Included costs in the bit sand base are: The usual earth foundation requires: (i) Site cleared of vegetable matter, (ii) Compacted chemically inert fill, (iii) Drainage layer 150mm thick of stable permeable compacted granular construction, (iv) 50 mm thick bitumen/sand (Bit sand) layer (laid to correct falls). Drainage, periphery details and sizes are set out in BS 2654 (see fig 35). In all cases cost additions are required for bit-sand bases. (See separate table).

Referencing details: 1. Diameter of tank. 2. Height of tank. 3. Material tank is made out of and whether welded or bolted plates. 4. Painting. 5. Any other known features - internally lined etc. 6. Fixed or Floating Head. 7. Age.

Cost information notes: These costs include external painting. Costs do not include for bitsand foundations, concrete and/or concrete - pile foundations, heating coils, insulation (rock wool), linings (butyl), structural stairways, catwalks, between tank walkways, etc. Further additions: - It is assumed that the outside of the tank is painted with a general long

Tanks

CG Code: 215P01

Specific: Stainless Steel

Descriptive: Vertical Fixed Head - SS304

Tech 1: Commercial Tank Farms - Specialised

Tech 2: 500m³

Unit size: Per cubic metre

Unit of measurement: m3

ERC: £1,229

Superseded codes: -

Location factor: Considered Not Applicable at time of Publication

Description: Tanks found on Commercial Tank Farms and Fuel Depots together with Individual Tanks or clusters of tanks on Major Food Establishments or breweries. They are generally an all stainless steel construction. The tanks are similar in construction to mild steel tanks and similar in design. Their weight pro rata of steel thickness is greater and careful referencing of foundation detail is required. These tanks are usually erected on-site built over an existing bit sand foundation (formed under the tank base plate). The bit sand cone is usually formed on an over site concrete base (e.g. 150 mm). This type of tank is intended for processed product storage and normally do not exceed 20,000 cu m in volume. They usually contain either food products i.e. milk, beer, or, aggressive chemicals i.e. dilute acids or alkalis. It is unusual to find in this category floating head tanks. The costs are for fixed head tanks. Fixed roofs are conical and self-supporting made of 5 mm stainless steel plates welded at the edges. The tanks are purpose designed by the tank farm operator and built to their specification. For smaller flat bottomed tanks found in smaller industrial units see 215G09. The design life is at minimum 30 years and their second hand life is long, therefore they are initially more expensive to purchase but having less maintenance than equivalent mild steel tanks. Stainless steel contains a high percentage of nickel. Nickel is a product quoted on the commercial markets and has a high fluctuation in exchange rates. There are a few large tank manufacturers who are able to buy stainless steel when the price is low and stockpile large plates for future use. Many of the smaller companies have limited stocks and often buy to order. The price of individual items can therefore vary considerably. Working with stainless steel is harder than with mild steel and thus where shapes and designs are complex the cost increases dramatically. For Bulk Liquid Storage Tanks (as found on commercial tank farms) the assumption is that they have been purchased from a leading stainless steel manufacturer and that the design is that of a typical bulk liquid storage tank. Stainless Steel Tanks situated within Commercial Tank farms and Petroleum depots sit on a bit sand foundation (see separate Description and costings). Most bulk storage tanks are built with a cone up centre however some tanks have a sump in the centre of the tank. In the usual cone up situation the foundations to the tank should be established

by reference to plans and sections and costed with reference to BEAMS. The usual earth foundation requires (i) site cleared of vegetable matter, (ii) compacted chemically inert fill, (iii) drainage layer 150mm thick of stable permeable compacted granular construction, (iv) 50mm thick bitumen/sand (Bit sand) layer (laid to correct falls). Drainage, periphery details and sizes are set out in BS 2654 (see: - Cost Guide Bit sand Bases - Section through typical Bit sand Find). Additions for Foundations - For small tanks the addition for this type of foundation will be some 12% whereas for larger tanks a 9% addition is required. A 10% addition for foundations is therefore proposed to ALL BULK STORAGE TANKS where individual costings are not possible. Pro rata with Mild Steel tanks the amount for foundations will be higher reflecting the greater weight in the tank construction. FOUNDATIONS to Bulk Storage Tanks where site details are not known 10% ADDITION to basic tank costs. Notes on Foundations - In some cases the chemically inert fill layer may consist of concrete up to 100mm deep. The 10% addition is still applicable in these cases. For piled and thicker raft foundations under the tank a further addition will be required and these should be calculated with reference to the relevant section in the Cost Guide or after discussion with the BEAMS.

Referencing details: Costs do not include for Bitsand foundations, concrete/pile foundations, heating coils, insulation (Rockwood), structural stairways, catwalks, between tank walkways, etc. Stairways that are structures in their own right should be rated (costed and valued) following Class 4 Table 3 stairways. These stairways are for example where spot brackets welded to the tank support the item. In the case where every rung of the staircase is welded to the tank these staircases are NOT rateable as they are not staircases in their own right (Class 4 Table 3) and they do not form an integral part of such an item see Class 4 (b) i.e. they are not part of the structure of the tank. Stairways are usually mild steel, which has been galvanised.

Cost information notes: The Cost figures are for Stainless Steel tanks having up to 6 mm thick bottom plates. The scales are suitable to tanks having bottom plate thicknesses of between 5 mm and 8 mm. Tanks with bottom plates of + 8 mm thickness may have an addition of up to 40% to account for extra costs.

Rateable element: Tanks - Class 4, Table 4 Class 2(d) Draining (e) Supplying Water (f) Protection from hazards. List of accessories 1 and 2.

Non-rateable element: If under Class 2, whole if Class 2 proviso applies - other than. If under Class 4 Heating coils, Rockwood insulation, paddles.

Adjusted plant and machinery: Foundations, catwalks, bunds, structural staircases, piles, fire protection equipment, high-level walkways.

Number of items adjusted: The item can typically be found on an industrial, commercial or office complex. Some hereditaments may have multiple items, in which case the ERC needs to reflect the number of items.

They are generally an all stainless steel construction. The tanks are similar in construction to mild steel tanks and similar in design. Their weight pro rata of steel thickness is greater and careful referencing of foundation detail is required. These tanks are usually erected on-site built over an existing bit sand foundation (formed under the tank base plate). The bit sand cone is usually formed on an over site concrete base (e.g. 150 mm). This type of tank is intended for processed product storage and normally do not exceed 20,000 cu m in volume. They usually contain either food products i.e. milk, beer, or, aggressive chemicals i.e. dilute acids or alkalis. It is unusual to find in this category floating head tanks. The costs are for fixed head tanks. Fixed roofs are conical and self-supporting made of 5 mm stainless steel plates welded at the edges. The tanks are purpose designed by the tank farm operator and built to their specification. For smaller flat bottomed tanks found in smaller industrial units see 215G09. The design life is at minimum 30 years and their second hand life is long, therefore they are initially more expensive to purchase but having less maintenance than equivalent mild steel tanks. Stainless steel contains a high percentage of nickel. Nickel is a product quoted on the commercial markets and has a high fluctuation in exchange rates. There are a few large tank manufacturers who are able to buy stainless steel when the price is low and stockpile large plates for future use. Many of the smaller companies have limited stocks and often buy to order. The price of individual items can therefore vary considerably. Working with stainless steel is harder than with mild steel and thus where shapes and designs are complex the cost increases dramatically. For Bulk Liquid Storage Tanks (as found on commercial tank farms) the assumption is that they have been purchased from a leading stainless steel manufacturer and that the design is that of a typical bulk liquid storage tank. Stainless Steel Tanks situated within Commercial Tank farms and Petroleum depots sit on a bit sand foundation (see separate Description and costings). Most bulk

storage tanks are built with a cone up centre however some tanks have a sump in the centre of the tank. In the usual cone up situation the foundations to the tank should be established by reference to plans and sections and costed with reference to BEAMS. The usual earth foundation requires (i) site cleared of vegetable matter, (ii) compacted chemically inert fill, (iii) drainage layer 150mm thick of stable permeable compacted granular construction, (iv) 50mm thick bitumen/sand (Bit sand) layer (laid to correct falls). Drainage, periphery details and sizes are set out in BS 2654 (see: - Cost Guide Bit sand Bases - Section through typical Bit sand Find). Additions for Foundations - For small tanks the addition for this type of foundation will be some 12% whereas for larger tanks a 9% addition is required. A 10% addition for foundations is therefore proposed to ALL BULK STORAGE TANKS where individual costings are not possible. Pro rata with Mild Steel tanks the amount for foundations will be higher reflecting the greater weight in the tank construction. FOUNDATIONS to Bulk Storage Tanks where site details are not known 10% ADDITION to basic tank costs. Notes on Foundations - In some cases the chemically inert fill layer may consist of concrete up to 100mm deep. The 10% addition is still applicable in these cases. For piled and thicker raft foundations under the tank a further addition will be required and these should be calculated with reference to the relevant section in the Cost Guide or after discussion with the BEAMS.

Referencing details: Costs do not include for Bitsand foundations, concrete/pile foundations, heating coils, insulation (Rockwood), structural stairways, catwalks, between tank walkways, etc. Stairways that are structures in their own right should be rated (costed and valued) following Class 4 Table 3 stairways. These stairways are for example where spot brackets welded to the tank support the item. In the case where every rung of the staircase is welded to the tank these staircases are NOT rateable as they are not staircases in their own right (Class 4 Table 3) and they do not form an integral part of such an item see Class 4 (b) i.e. they are not part of the structure of the tank. Stairways are usually mild steel, which has been galvanised.

Cost information notes: The Cost figures are for Stainless Steel tanks having up to 6 mm thick bottom plates. The scales are suitable to tanks having bottom plate thicknesses of between 5 mm and 8 mm. Tanks with bottom plates of + 8 mm thickness may have an addition of up to 40% to account for extra costs.

Rateable element: Tanks - Class 4, Table 4 Class 2(d) Draining (e) Supplying Water (f) Protection from hazards. List of accessories 1 and 2.

Non-rateable element: If under Class 2, whole if Class 2 proviso applies - other than. If under Class 4 Heating coils, Rockwood insulation, paddles.

Adjusted plant and machinery: Foundations, catwalks, bunds, structural staircases, piles, fire protection equipment, high-level walkways.

Number of items adjusted: The item can typically be found on an industrial, commercial or office complex. Some hereditaments may have multiple items, in which case the ERC needs to reflect the number of items.

Contract size adjustment: See Appendix BEAMS Note 1

Description: Tanks found on Commercial Tank Farms and Fuel Depots together with Individual Tanks or clusters of tanks on Major Food Establishments or breweries. They are generally an all stainless steel construction. The tanks are similar in construction to mild steel tanks and similar in design. Their weight pro rata of steel thickness is greater and careful referencing of foundation detail is required. These tanks are usually erected on-site built over an existing bit sand foundation (formed under the tank base plate). The bit sand cone is usually formed on an over site concrete base (e.g. 150 mm). This type of tank is intended for processed product storage and normally do not exceed 20,000 cu m in volume. They usually contain either food products i.e. milk, beer, or, aggressive chemicals i.e. dilute acids or alkalis. It is unusual to find in this category floating head tanks. The costs are for fixed head tanks. Fixed roofs are conical and self-supporting made of 5 mm stainless steel plates welded at the edges. The tanks are purpose designed by the tank farm operator and built to their specification. For smaller flat bottomed tanks found in smaller industrial units see 215G09. The design life is at minimum 30 years and their second hand life is long, therefore they are initially more expensive to purchase but having less maintenance than equivalent mild steel tanks. Stainless steel contains a high percentage of nickel. Nickel is a product quoted on the commercial markets and has a high fluctuation in exchange rates. There are a few large tank manufacturers who are able to buy stainless steel when the price is low and stockpile large plates for future use. Many of the smaller companies have limited stocks and often buy to order. The price of individual items can therefore vary considerably. Working with stainless steel is harder than with mild steel and thus where shapes and designs are complex the cost increases dramatically. For Bulk Liquid Storage Tanks (as found on commercial tank farms) the assumption is that they have been purchased from a leading stainless steel manufacturer and that the design is that of a typical bulk liquid storage tank. Stainless Steel Tanks situated within Commercial Tank farms and Petroleum depots sit on a bit sand foundation (see separate Description and costings). Most bulk

storage tanks are built with a cone up centre however some tanks have a sump in the centre of the tank. In the usual cone up situation the foundations to the tank should be established by reference to plans and sections and costed with reference to BEAMS. The usual earth foundation requires (i) site cleared of vegetable matter, (ii) compacted chemically inert fill, (iii) drainage layer 150mm thick of stable permeable compacted granular construction, (iv) 50mm thick bitumen/sand (Bit sand) layer (laid to correct falls). Drainage, periphery details and sizes are set out in BS 2654 (see: - Cost Guide Bit sand Bases - Section through typical Bit sand Find). Additions for Foundations - For small tanks the addition for this type of foundation will be some 12% whereas for larger tanks a 9% addition is required. A 10% addition for foundations is therefore proposed to ALL BULK STORAGE TANKS where individual costings are not possible. Pro rata with Mild Steel tanks the amount for foundations will be higher reflecting the greater weight in the tank construction. FOUNDATIONS to Bulk Storage Tanks where site details are not known 10% ADDITION to basic tank costs. Notes on Foundations - In some cases the chemically inert fill layer may consist of concrete up to 100mm deep. The 10% addition is still applicable in these cases. For piled and thicker raft foundations under the tank a further addition will be required and these should be calculated with reference to the relevant section in the Cost Guide or after discussion with the BEAMS.

Referencing details: Costs do not include for Bitsand foundations, concrete/pile foundations, heating coils, insulation (Rockwood), structural stairways, catwalks, between tank walkways, etc. Stairways that are structures in their own right should be rated (costed and valued) following Class 4 Table 3 stairways. These stairways are for example where spot brackets welded to the tank support the item. In the case where every rung of the staircase is welded to the tank these staircases are NOT rateable as they are not staircases in their own right (Class 4 Table 3) and they do not form an integral part of such an item see Class 4 (b) i.e. they are not part of the structure of the tank. Stairways are usually mild steel, which has been galvanised.

Cost information notes: The Cost figures are for Stainless Steel tanks having up to 6 mm thick bottom plates. The scales are suitable to tanks having bottom plate thicknesses of between 5 mm and 8 mm. Tanks with bottom plates of + 8 mm thickness may have an addition of up to 40% to account for extra costs.

Rateable element: Tanks - Class 4, Table 4 Class 2(d) Draining (e) Supplying Water (f) Protection from hazards. List of accessories 1 and 2.

Non-rateable element: If under Class 2, whole if Class 2 proviso applies - other than. If under Class 4 Heating coils, Rockwood insulation, paddles.

Adjusted plant and machinery: Foundations, catwalks, bunds, structural staircases, piles, fire protection equipment, high-level walkways.

Number of items adjusted: The item can typically be found on an industrial, commercial or office complex. Some hereditaments may have multiple items, in which case the ERC needs to reflect the number of items.

Contract size adjustment: See Appendix BEAMS Note 1

Description: Tanks found on Commercial Tank Farms and Fuel Depots together with Individual Tanks or clusters of tanks on Major Food Establishments or breweries. They are generally an all stainless steel construction. The tanks are similar in construction to mild steel tanks and similar in design. Their weight pro rata of steel thickness is greater and careful referencing of foundation detail is required. These tanks are usually erected on-site built over an existing bit sand foundation (formed under the tank base plate). The bit sand cone is usually formed on an over site concrete base (e.g. 150 mm). This type of tank is intended for processed product storage and normally do not exceed 20,000 cu m in volume. They usually contain either food products i.e. milk, beer, or, aggressive chemicals i.e. dilute acids or alkalis. It is unusual to find in this category floating head tanks. The costs are for fixed head tanks. Fixed roofs are conical and self-supporting made of 5 mm stainless steel plates welded at the edges. The tanks are purpose designed by the tank farm operator and built to their specification. For smaller flat bottomed tanks found in smaller industrial units see 215G09. The design life is at minimum 30 years and their second hand life is long, therefore they are initially more expensive to purchase but having less maintenance than equivalent mild steel tanks. Stainless steel contains a high percentage of nickel. Nickel is a product quoted on the commercial markets and has a high fluctuation in exchange rates. There are a few large tank manufacturers who are able to buy stainless steel when the price is low and stockpile large plates for future use. Many of the smaller companies have limited stocks and often buy to order. The price of individual items can therefore vary considerably. Working with stainless steel is harder than with mild steel and thus where shapes and designs are complex the cost increases dramatically. For Bulk Liquid Storage Tanks (as found on commercial tank farms) the assumption is that they have been purchased from a leading stainless steel manufacturer and that the design is that of a typical bulk liquid storage tank. Stainless Steel Tanks situated within Commercial Tank farms and Petroleum depots sit on a bit sand foundation (see separate Description and costings). Most bulk

storage tanks are built with a cone up centre however some tanks have a sump in the centre of the tank. In the usual cone up situation the foundations to the tank should be established by reference to plans and sections and costed with reference to BEAMS. The usual earth foundation requires (i) site cleared of vegetable matter, (ii) compacted chemically inert fill, (iii) drainage layer 150mm thick of stable permeable compacted granular construction, (iv) 50mm thick bitumen/sand (Bit sand) layer (laid to correct falls). Drainage, periphery details and sizes are set out in BS 2654 (see: - Cost Guide Bit sand Bases - Section through typical Bit sand Find). Additions for Foundations - For small tanks the addition for this type of foundation will be some 12% whereas for larger tanks a 9% addition is required. A 10% addition for foundations is therefore proposed to ALL BULK STORAGE TANKS where individual costings are not possible. Pro rata with Mild Steel tanks the amount for foundations will be higher reflecting the greater weight in the tank construction. FOUNDATIONS to Bulk Storage Tanks where site details are not known 10% ADDITION to basic tank costs. Notes on Foundations - In some cases the chemically inert fill layer may consist of concrete up to 100mm deep. The 10% addition is still applicable in these cases. For piled and thicker raft foundations under the tank a further addition will be required and these should be calculated with reference to the relevant section in the Cost Guide or after discussion with the BEAMS.

Referencing details: Costs do not include for Bitsand foundations, concrete/pile foundations, heating coils, insulation (Rockwood), structural stairways, catwalks, between tank walkways, etc. Stairways that are structures in their own right should be rated (costed and valued) following Class 4 Table 3 stairways. These stairways are for example where spot brackets welded to the tank support the item. In the case where every rung of the staircase is welded to the tank these staircases are NOT rateable as they are not staircases in their own right (Class 4 Table 3) and they do not form an integral part of such an item see Class 4 (b) i.e. they are not part of the structure of the tank. Stairways are usually mild steel, which has been galvanised.

Cost information notes: The Cost figures are for Stainless Steel tanks having up to 6 mm thick bottom plates. The scales are suitable to tanks having bottom plate thicknesses of between 5 mm and 8 mm. Tanks with bottom plates of + 8 mm thickness may have an addition of up to 40% to account for extra costs.

Rateable element: Tanks - Class 4, Table 4 Class 2(d) Draining (e) Supplying Water (f) Protection from hazards. List of accessories 1 and 2.

Non-rateable element: If under Class 2, whole if Class 2 proviso applies - other than. If under Class 4 Heating coils, Rockwood insulation, paddles.

Adjusted plant and machinery: Foundations, catwalks, bunds, structural staircases, piles, fire protection equipment, high-level walkways.

Number of items adjusted: The item can typically be found on an industrial, commercial or office complex. Some hereditaments may have multiple items, in which case the ERC needs to reflect the number of items.

Contract size adjustment: See Appendix BEAMS Note 1

Description: Tanks found on Commercial Tank Farms and Fuel Depots together with Individual Tanks or clusters of tanks on Major Food Establishments or breweries. They are generally an all stainless steel construction. The tanks are similar in construction to mild steel tanks and similar in design. Their weight pro rata of steel thickness is greater and careful referencing of foundation detail is required. These tanks are usually erected on-site built over an existing bit sand foundation (formed under the tank base plate). The bit sand cone is usually formed on an over site concrete base (e.g. 150 mm). This type of tank is intended for processed product storage and normally do not exceed 20,000 cu m in volume. They usually contain either food products i.e. milk, beer, or, aggressive chemicals i.e. dilute acids or alkalis. It is unusual to find in this category floating head tanks. The costs are for fixed head tanks. Fixed roofs are conical and self-supporting made of 5 mm stainless steel plates welded at the edges. The tanks are purpose designed by the tank farm operator and built to their specification. For smaller flat bottomed tanks found in smaller industrial units see 215G09. The design life is at minimum 30 years and their second hand life is long, therefore they are initially more expensive to purchase but having less maintenance than equivalent mild steel tanks. Stainless steel contains a high percentage of nickel. Nickel is a product quoted on the commercial markets and has a high fluctuation in exchange rates. There are a few large tank manufacturers who are able to buy stainless steel when the price is low and stockpile large plates for future use. Many of the smaller companies have limited stocks and often buy to order. The price of individual items can therefore vary considerably. Working with stainless steel is harder than with mild steel and thus where shapes and designs are complex the cost increases dramatically. For Bulk Liquid Storage Tanks (as found on commercial tank farms) the assumption is that they have been purchased from a leading stainless steel manufacturer and that the design is that of a typical bulk liquid storage tank. Stainless Steel Tanks situated within Commercial Tank farms and Petroleum depots sit on a bit sand foundation (see separate Description and costings). Most bulk

storage tanks are built with a cone up centre however some tanks have a sump in the centre of the tank. In the usual cone up situation the foundations to the tank should be established by reference to plans and sections and costed with reference to BEAMS. The usual earth foundation requires (i) site cleared of vegetable matter, (ii) compacted chemically inert fill, (iii) drainage layer 150mm thick of stable permeable compacted granular construction, (iv) 50mm thick bitumen/sand (Bit sand) layer (laid to correct falls). Drainage, periphery details and sizes are set out in BS 2654 (see: - Cost Guide Bit sand Bases - Section through typical Bit sand Find). Additions for Foundations - For small tanks the addition for this type of foundation will be some 12% whereas for larger tanks a 9% addition is required. A 10% addition for foundations is therefore proposed to ALL BULK STORAGE TANKS where individual costings are not possible. Pro rata with Mild Steel tanks the amount for foundations will be higher reflecting the greater weight in the tank construction. FOUNDATIONS to Bulk Storage Tanks where site details are not known 10% ADDITION to basic tank costs. Notes on Foundations - In some cases the chemically inert fill layer may consist of concrete up to 100mm deep. The 10% addition is still applicable in these cases. For piled and thicker raft foundations under the tank a further addition will be required and these should be calculated with reference to the relevant section in the Cost Guide or after discussion with the BEAMS.

Referencing details: Costs do not include for Bitsand foundations, concrete/pile foundations, heating coils, insulation (Rockwood), structural stairways, catwalks, between tank walkways, etc. Stairways that are structures in their own right should be rated (costed and valued) following Class 4 Table 3 stairways. These stairways are for example where spot brackets welded to the tank support the item. In the case where every rung of the staircase is welded to the tank these staircases are NOT rateable as they are not staircases in their own right (Class 4 Table 3) and they do not form an integral part of such an item see Class 4 (b) i.e. they are not part of the structure of the tank. Stairways are usually mild steel, which has been galvanised.

Cost information notes: The Cost figures are for Stainless Steel tanks having up to 6 mm thick bottom plates. The scales are suitable to tanks having bottom plate thicknesses of between 5 mm and 8 mm. Tanks with bottom plates of + 8 mm thickness may have an addition of up to 40% to account for extra costs.

Rateable element: Tanks - Class 4, Table 4 Class 2(d) Draining (e) Supplying Water (f) Protection from hazards. List of accessories 1 and 2.

Non-rateable element: If under Class 2, whole if Class 2 proviso applies - other than. If under Class 4 Heating coils, Rockwood insulation, paddles.

Adjusted plant and machinery: Foundations, catwalks, bunds, structural staircases, piles, fire protection equipment, high-level walkways.

Number of items adjusted: The item can typically be found on an industrial, commercial or office complex. Some hereditaments may have multiple items, in which case the ERC needs to reflect the number of items.

Contract size adjustment: See Appendix BEAMS Note 1

Description: Tanks found on Commercial Tank Farms and Fuel Depots together with Individual Tanks or clusters of tanks on Major Food Establishments or breweries. They are generally an all stainless steel construction. The tanks are similar in construction to mild steel tanks and similar in design. Their weight pro rata of steel thickness is greater and careful referencing of foundation detail is required. These tanks are usually erected on-site built over an existing bit sand foundation (formed under the tank base plate). The bit sand cone is usually formed on an over site concrete base (e.g. 150 mm). This type of tank is intended for processed product storage and normally do not exceed 20,000 cu m in volume. They usually contain either food products i.e. milk, beer, or, aggressive chemicals i.e. dilute acids or alkalis. It is unusual to find in this category floating head tanks. The costs are for fixed head tanks. Fixed roofs are conical and self-supporting made of 5 mm stainless steel plates welded at the edges. The tanks are purpose designed by the tank farm operator and built to their specification. For smaller flat bottomed tanks found in smaller industrial units see 215G09. The design life is at minimum 30 years and their second hand life is long, therefore they are initially more expensive to purchase but having less maintenance than equivalent mild steel tanks. Stainless steel contains a high percentage of nickel. Nickel is a product quoted on the commercial markets and has a high fluctuation in exchange rates. There are a few large tank manufacturers who are able to buy stainless steel when the price is low and stockpile large plates for future use. Many of the smaller companies have limited stocks and often buy to order. The price of individual items can therefore vary considerably. Working with stainless steel is harder than with mild steel and thus where shapes and designs are complex the cost increases dramatically. For Bulk Liquid Storage Tanks (as found on commercial tank farms) the assumption is that they have been purchased from a leading stainless steel manufacturer and that the design is that of a typical bulk liquid storage tank. Stainless Steel Tanks situated within Commercial Tank farms and Petroleum depots sit on a bit sand foundation (see separate Description and costings). Most bulk

storage tanks are built with a cone up centre however some tanks have a sump in the centre of the tank. In the usual cone up situation the foundations to the tank should be established by reference to plans and sections and costed with reference to BEAMS. The usual earth foundation requires (i) site cleared of vegetable matter, (ii) compacted chemically inert fill, (iii) drainage layer 150mm thick of stable permeable compacted granular construction, (iv) 50mm thick bitumen/sand (Bit sand) layer (laid to correct falls). Drainage, periphery details and sizes are set out in BS 2654 (see: - Cost Guide Bit sand Bases - Section through typical Bit sand Find). Additions for Foundations - For small tanks the addition for this type of foundation will be some 12% whereas for larger tanks a 9% addition is required. A 10% addition for foundations is therefore proposed to ALL BULK STORAGE TANKS where individual costings are not possible. Pro rata with Mild Steel tanks the amount for foundations will be higher reflecting the greater weight in the tank construction. FOUNDATIONS to Bulk Storage Tanks where site details are not known 10% ADDITION to basic tank costs. Notes on Foundations - In some cases the chemically inert fill layer may consist of concrete up to 100mm deep. The 10% addition is still applicable in these cases. For piled and thicker raft foundations under the tank a further addition will be required and these should be calculated with reference to the relevant section in the Cost Guide or after discussion with the BEAMS.

Referencing details: Costs do not include for Bitsand foundations, concrete/pile foundations, heating coils, insulation (Rockwood), structural stairways, catwalks, between tank walkways, etc. Stairways that are structures in their own right should be rated (costed and valued) following Class 4 Table 3 stairways. These stairways are for example where spot brackets welded to the tank support the item. In the case where every rung of the staircase is welded to the tank these staircases are NOT rateable as they are not staircases in their own right (Class 4 Table 3) and they do not form an integral part of such an item see Class 4 (b) i.e. they are not part of the structure of the tank. Stairways are usually mild steel, which has been galvanised.

Cost information notes: The Cost figures are for Stainless Steel tanks having up to 6 mm thick bottom plates. The scales are suitable to tanks having bottom plate thicknesses of between 5 mm and 8 mm. Tanks with bottom plates of + 8 mm thickness may have an addition of up to 40% to account for extra costs.

Rateable element: Tanks - Class 4, Table 4 Class 2(d) Draining (e) Supplying Water (f) Protection from hazards. List of accessories 1 and 2.

Non-rateable element: If under Class 2, whole if Class 2 proviso applies - other than. If under Class 4 Heating coils, Rockwood insulation, paddles.

Adjusted plant and machinery: Foundations, catwalks, bunds, structural staircases, piles, fire protection equipment, high-level walkways.

Number of items adjusted: The item can typically be found on an industrial, commercial or office complex. Some hereditaments may have multiple items, in which case the ERC needs to reflect the number of items.

Contract size adjustment: See Appendix BEAMS Note 1

Description: Tanks found on Commercial Tank Farms and Fuel Depots together with Individual Tanks or clusters of tanks on Major Food Establishments or breweries. They are generally an all stainless steel construction. The tanks are similar in construction to mild steel tanks and similar in design. Their weight pro rata of steel thickness is greater and careful referencing of foundation detail is required. These tanks are usually erected on-site built over an existing bit sand foundation (formed under the tank base plate). The bit sand cone is usually formed on an over site concrete base (e.g. 150 mm). This type of tank is intended for processed product storage and normally do not exceed 20,000 cu m in volume. They usually contain either food products i.e. milk, beer, or, aggressive chemicals i.e. dilute acids or alkalis. It is unusual to find in this category floating head tanks. The costs are for fixed head tanks. Fixed roofs are conical and self-supporting made of 5 mm stainless steel plates welded at the edges. The tanks are purpose designed by the tank farm operator and built to their specification. For smaller flat bottomed tanks found in smaller industrial units see 215G09. The design life is at minimum 30 years and their second hand life is long, therefore they are initially more expensive to purchase but having less maintenance than equivalent mild steel tanks. Stainless steel contains a high percentage of nickel. Nickel is a product quoted on the commercial markets and has a high fluctuation in exchange rates. There are a few large tank manufacturers who are able to buy stainless steel when the price is low and stockpile large plates for future use. Many of the smaller companies have limited stocks and often buy to order. The price of individual items can therefore vary considerably. Working with stainless steel is harder than with mild steel and thus where shapes and designs are complex the cost increases dramatically. For Bulk Liquid Storage Tanks (as found on commercial tank farms) the assumption is that they have been purchased from a leading stainless steel manufacturer and that the design is that of a typical bulk liquid storage tank. Stainless Steel Tanks situated within Commercial Tank farms and Petroleum depots sit on a bit sand foundation (see separate Description and costings). Most bulk

storage tanks are built with a cone up centre however some tanks have a sump in the centre of the tank. In the usual cone up situation the foundations to the tank should be established by reference to plans and sections and costed with reference to BEAMS. The usual earth foundation requires (i) site cleared of vegetable matter, (ii) compacted chemically inert fill, (iii) drainage layer 150mm thick of stable permeable compacted granular construction, (iv) 50mm thick bitumen/sand (Bit sand) layer (laid to correct falls). Drainage, periphery details and sizes are set out in BS 2654 (see: - Cost Guide Bit sand Bases - Section through typical Bit sand Find). Additions for Foundations - For small tanks the addition for this type of foundation will be some 12% whereas for larger tanks a 9% addition is required. A 10% addition for foundations is therefore proposed to ALL BULK STORAGE TANKS where individual costings are not possible. Pro rata with Mild Steel tanks the amount for foundations will be higher reflecting the greater weight in the tank construction. FOUNDATIONS to Bulk Storage Tanks where site details are not known 10% ADDITION to basic tank costs. Notes on Foundations - In some cases the chemically inert fill layer may consist of concrete up to 100mm deep. The 10% addition is still applicable in these cases. For piled and thicker raft foundations under the tank a further addition will be required and these should be calculated with reference to the relevant section in the Cost Guide or after discussion with the BEAMS.

Referencing details: Costs do not include for Bitsand foundations, concrete/pile foundations, heating coils, insulation (Rockwood), structural stairways, catwalks, between tank walkways, etc. Stairways that are structures in their own right should be rated (costed and valued) following Class 4 Table 3 stairways. These stairways are for example where spot brackets welded to the tank support the item. In the case where every rung of the staircase is welded to the tank these staircases are NOT rateable as they are not staircases in their own right (Class 4 Table 3) and they do not form an integral part of such an item see Class 4 (b) i.e. they are not part of the structure of the tank. Stairways are usually mild steel, which has been galvanised.

Cost information notes: The Cost figures are for Stainless Steel tanks having up to 6 mm thick bottom plates. The scales are suitable to tanks having bottom plate thicknesses of between 5 mm and 8 mm. Tanks with bottom plates of + 8 mm thickness may have an addition of up to 40% to account for extra costs.

Rateable element: Tanks - Class 4, Table 4 Class 2(d) Draining (e) Supplying Water (f) Protection from hazards. List of accessories 1 and 2.

Non-rateable element: If under Class 2, whole if Class 2 proviso applies - other than. If under Class 4 Heating coils, Rockwood insulation, paddles.

Adjusted plant and machinery: Foundations, catwalks, bunds, structural staircases, piles, fire protection equipment, high-level walkways.

Number of items adjusted: The item can typically be found on an industrial, commercial or office complex. Some hereditaments may have multiple items, in which case the ERC needs to reflect the number of items.

Contract size adjustment: See Appendix BEAMS Note 1

Description: Tanks found on Commercial Tank Farms and Fuel Depots together with Individual Tanks or clusters of tanks on Major Food Establishments or breweries. They are generally an all stainless steel construction. The tanks are similar in construction to mild steel tanks and similar in design. Their weight pro rata of steel thickness is greater and careful referencing of foundation detail is required. These tanks are usually erected on-site built over an existing bit sand foundation (formed under the tank base plate). The bit sand cone is usually formed on an over site concrete base (e.g. 150 mm). This type of tank is intended for processed product storage and normally do not exceed 20,000 cu m in volume. They usually contain either food products i.e. milk, beer, or, aggressive chemicals i.e. dilute acids or alkalis. It is unusual to find in this category floating head tanks. The costs are for fixed head tanks. Fixed roofs are conical and self-supporting made of 5 mm stainless steel plates welded at the edges. The tanks are purpose designed by the tank farm operator and built to their specification. For smaller flat bottomed tanks found in smaller industrial units see 215G09. The design life is at minimum 30 years and their second hand life is long, therefore they are initially more expensive to purchase but having less maintenance than equivalent mild steel tanks. Stainless steel contains a high percentage of nickel. Nickel is a product quoted on the commercial markets and has a high fluctuation in exchange rates. There are a few large tank manufacturers who are able to buy stainless steel when the price is low and stockpile large plates for future use. Many of the smaller companies have limited stocks and often buy to order. The price of individual items can therefore vary considerably. Working with stainless steel is harder than with mild steel and thus where shapes and designs are complex the cost increases dramatically. For Bulk Liquid Storage Tanks (as found on commercial tank farms) the assumption is that they have been purchased from a leading stainless steel manufacturer and that the design is that of a typical bulk liquid storage tank. Stainless Steel Tanks situated within Commercial Tank farms and Petroleum depots sit on a bit sand foundation (see separate Description and costings). Most bulk storage tanks are built with a cone up centre however some tanks have a sump in the centre of the tank. In the usual cone up situation the foundations to the tank should be established

by reference to plans and sections and costed with reference to BEAMS. The usual earth foundation requires (i) site cleared of vegetable matter, (ii) compacted chemically inert fill, (iii) drainage layer 150mm thick of stable permeable compacted granular construction, (iv) 50mm thick bitumen/sand (Bit sand) layer (laid to correct falls). Drainage, periphery details and sizes are set out in BS 2654 (see: - Cost Guide Bit sand Bases - Section through typical Bit sand Find). Additions for Foundations - For small tanks the addition for this type of foundation will be some 12% whereas for larger tanks a 9% addition is required. A 10% addition for foundations is therefore proposed to ALL BULK STORAGE TANKS where individual costings are not possible. Pro rata with Mild Steel tanks the amount for foundations will be higher reflecting the greater weight in the tank construction. FOUNDATIONS to Bulk Storage Tanks where site details are not known 10% ADDITION to basic tank costs. Notes on Foundations - In some cases the chemically inert fill layer may consist of concrete up to 100mm deep. The 10% addition is still applicable in these cases. For piled and thicker raft foundations under the tank a further addition will be required and these should be calculated with reference to the relevant section in the Cost Guide or after discussion with the BEAMS.

Referencing details: Costs do not include for Bitsand foundations, concrete/pile foundations, heating coils, insulation (Rockwood), structural stairways, catwalks, between tank walkways, etc. Stairways that are structures in their own right should be rated (costed and valued) following Class 4 Table 3 stairways. These stairways are for example where spot brackets welded to the tank support the item. In the case where every rung of the staircase is welded to the tank these staircases are NOT rateable as they are not staircases in their own right (Class 4 Table 3) and they do not form an integral part of such an item see Class 4 (b) i.e. they are not part of the structure of the tank. Stairways are usually mild steel, which has been galvanised.

Cost information notes: The Cost figures are for Stainless Steel tanks having up to 6 mm thick bottom plates. The scales are suitable to tanks having bottom plate thicknesses of between 5 mm and 8 mm. Tanks with bottom plates of + 8 mm thickness may have an addition of up to 40% to account for extra costs.

Rateable element: Tanks - Class 4, Table 4 Class 2(d) Draining (e) Supplying Water (f) Protection from hazards. List of accessories 1 and 2.

Non-rateable element: If under Class 2, whole if Class 2 provision applies - other than. If under Class 4 Heating coils, Rockwood insulation, paddles.

Adjusted plant and machinery: Foundations, catwalks, bunds, structural staircases, piles, fire protection equipment, high-level walkways.

Number of items adjusted: The item can typically be found on an industrial, commercial or office complex. Some hereditaments may have multiple items, in which case the ERC needs to reflect the number of items.

Contract size adjustment: See Appendix BEAMS Note 1

Location factor: Considered Not Applicable at time of Publication

Description: Tanks found on Commercial Tank Farms and Fuel Depots together with Individual Tanks or clusters of tanks on Major Food Establishments or breweries. They are generally an all stainless steel construction. The tanks are similar in construction to mild steel tanks and similar in design. Their weight pro rata of steel thickness is greater and careful referencing of foundation detail is required. These tanks are usually erected on-site built over an existing bit sand foundation (formed under the tank base plate). The bit sand cone is usually formed on an over site concrete base (e.g. 150 mm). This type of tank is intended for processed product storage and normally do not exceed 20,000 cu m in volume. They usually contain either food products i.e. milk, beer, or, aggressive chemicals i.e. dilute acids or alkalis. It is unusual to find in this category floating head tanks. The costs are for fixed head tanks. Fixed roofs are conical and self-supporting made of 5 mm stainless steel plates welded at the edges. The tanks are purpose designed by the tank farm operator and built to their specification. For smaller flat bottomed tanks found in smaller industrial units see 215G09. The design life is at minimum 30 years and their second hand life is long, therefore they are initially more expensive to purchase but having less maintenance than equivalent mild steel tanks. Stainless steel contains a high percentage of nickel. Nickel is a product quoted on the commercial markets and has a high fluctuation in exchange rates. There are a few large tank manufacturers who are able to buy stainless steel when the price is low and stockpile large plates for future use. Many of the smaller companies have limited stocks and often buy to order. The price of individual items can therefore vary considerably. Working with stainless steel is harder than with mild steel and thus where shapes and designs are complex the cost increases dramatically. For Bulk Liquid Storage Tanks (as found on commercial tank farms) the assumption is that they have been purchased from a leading stainless steel manufacturer and that the design is that of a typical bulk liquid storage tank. Stainless Steel Tanks situated within Commercial Tank farms and Petroleum depots sit on a bit sand foundation (see separate Description and costings). Most bulk storage tanks are built with a cone up centre however some tanks have a sump in the centre of the tank. In the usual cone up situation the foundations to the tank should be established

by reference to plans and sections and costed with reference to BEAMS. The usual earth foundation requires (i) site cleared of vegetable matter, (ii) compacted chemically inert fill, (iii) drainage layer 150mm thick of stable permeable compacted granular construction, (iv) 50mm thick bitumen/sand (Bit sand) layer (laid to correct falls). Drainage, periphery details and sizes are set out in BS 2654 (see: - Cost Guide Bit sand Bases - Section through typical Bit sand Find). Additions for Foundations - For small tanks the addition for this type of foundation will be some 12% whereas for larger tanks a 9% addition is required. A 10% addition for foundations is therefore proposed to ALL BULK STORAGE TANKS where individual costings are not possible. Pro rata with Mild Steel tanks the amount for foundations will be higher reflecting the greater weight in the tank construction. FOUNDATIONS to Bulk Storage Tanks where site details are not known 10% ADDITION to basic tank costs. Notes on Foundations - In some cases the chemically inert fill layer may consist of concrete up to 100mm deep. The 10% addition is still applicable in these cases. For piled and thicker raft foundations under the tank a further addition will be required and these should be calculated with reference to the relevant section in the Cost Guide or after discussion with the BEAMS team.

Referencing details: Costs do not include for Bitsand foundations, concrete/pile foundations, heating coils, insulation (Rockwood), structural stairways, catwalks, between tank walkways, etc. Stairways that are structures in their own right should be rated (costed and valued) following Class 4 Table 3 stairways. These stairways are for example where spot brackets welded to the tank support the item. In the case where every rung of the staircase is welded to the tank these staircases are NOT rateable as they are not staircases in their own right (Class 4 Table 3) and they do not form an integral part of such an item see Class 4 (b) i.e. they are not part of the structure of the tank. Stairways are usually mild steel, which has been galvanised.

Cost information notes: The Cost figures are for Stainless Steel tanks having up to 6 mm thick bottom plates. The scales are suitable to tanks having bottom plate thicknesses of between 5 mm and 8 mm. Tanks with bottom plates of + 8 mm thickness may have an addition of up to 40% to account for extra costs.

Rateable element: Tanks - Class 4, Table 4 Class 2(d) Draining (e) Supplying Water (f) Protection from hazards. List of accessories 1 and 2.

Non-rateable element: If under Class 2, whole if Class 2 provision applies - other than. If under Class 4 Heating coils, Rockwood insulation, paddles.

Adjusted plant and machinery: Foundations, catwalks, bunds, structural staircases, piles, fire protection equipment, high-level walkways.

Number of items adjusted: The item can typically be found on an industrial, commercial or office complex. Some hereditaments may have multiple items, in which case the ERC needs to reflect the number of items.

Contract size adjustment: See Appendix BEAMS Note 1

Tech 2: 15000m³

Unit size: Per cubic metre

Unit of measurement: m3

ERC: £279

Superseded codes: -

Location factor: Considered Not Applicable at time of Publication

Description: Tanks found on Commercial Tank Farms and Fuel Depots together with Individual Tanks or clusters of tanks on Major Food Establishments or breweries. They are generally an all stainless steel construction. The tanks are similar in construction to mild steel tanks and similar in design. Their weight pro rata of steel thickness is greater and careful referencing of foundation detail is required. These tanks are usually erected on-site built over an existing bit sand foundation (formed under the tank base plate). The bit sand cone is usually formed on an over site concrete base (e.g. 150 mm). This type of tank is intended for processed product storage and normally do not exceed 20,000 cu m in volume. They usually contain either food products i.e. milk, beer, or, aggressive chemicals i.e. dilute acids or alkalis. It is unusual to find in this category floating head tanks. The costs are for fixed head tanks. Fixed roofs are conical and self-supporting made of 5 mm stainless steel plates welded at the edges. The tanks are purpose designed by the tank farm operator and built to their specification. For smaller flat bottomed tanks found in smaller industrial units see 215G09. The design life is at minimum 30 years and their second hand life is long, therefore they are initially more expensive to purchase but having less maintenance than equivalent mild steel tanks. Stainless steel contains a high percentage of nickel. Nickel is a product quoted on the commercial markets and has a high fluctuation in exchange rates. There are a few large tank manufacturers who are able to buy stainless steel when the price is low and stockpile large plates for future use. Many of the smaller companies have limited stocks and often buy to order. The price of individual items can therefore vary considerably. Working with stainless steel is harder than with mild steel and thus where shapes and designs are complex the cost increases dramatically. For Bulk Liquid Storage Tanks (as found on commercial tank farms) the assumption is that they have been purchased from a leading stainless steel manufacturer and that the design is that of a typical bulk liquid storage tank. Stainless Steel Tanks situated within Commercial Tank farms and Petroleum depots sit on a bit sand foundation (see separate Description and costings). Most bulk storage tanks are built with a cone up centre however some tanks have a sump in the centre of the tank. In the usual cone up situation the foundations to the tank should be established

by reference to plans and sections and costed with reference to BEAMS. The usual earth foundation requires (i) site cleared of vegetable matter, (ii) compacted chemically inert fill, (iii) drainage layer 150mm thick of stable permeable compacted granular construction, (iv) 50mm thick bitumen/sand (Bit sand) layer (laid to correct falls). Drainage, periphery details and sizes are set out in BS 2654 (see: - Cost Guide Bit sand Bases - Section through typical Bit sand Find). Additions for Foundations - For small tanks the addition for this type of foundation will be some 12% whereas for larger tanks a 9% addition is required. A 10% addition for foundations is therefore proposed to ALL BULK STORAGE TANKS where individual costings are not possible. Pro rata with Mild Steel tanks the amount for foundations will be higher reflecting the greater weight in the tank construction. FOUNDATIONS to Bulk Storage Tanks where site details are not known 10% ADDITION to basic tank costs. Notes on Foundations - In some cases the chemically inert fill layer may consist of concrete up to 100mm deep. The 10% addition is still applicable in these cases. For piled and thicker raft foundations under the tank a further addition will be required and these should be calculated with reference to the relevant section in the Cost Guide or after discussion with the BEAMS team.

Referencing details: Tanks - Class 4, Table 4 Class 2(d) Draining (e) Supplying Water (f) Protection from hazards. List of accessories 1 and 2.

Cost information notes: The Cost figures are for Stainless Steel tanks having up to 6 mm thick bottom plates. The scales are suitable to tanks having bottom plate thicknesses of between 5 mm and 8 mm. Tanks with bottom plates of + 8 mm thickness may have an addition of up to 40% to account for extra costs.

Rateable element: If under Class 2, whole if Class 2 provision applies - other than. If under Class 4 Heating coils, Rockwood insulation, paddles.

Non-rateable element: Foundations, catwalks, bunds, structural staircases, piles, fire protection equipment, high-level walkways.

Adjusted plant and machinery: The item can typically be found on an industrial, commercial or office complex. Some hereditaments may have multiple items, in which case the ERC needs to reflect the number of items.

Location factor: Location Adjustment Applicable (See Guidance Notes) - ERC = UK mean of 1.00

Description: Tanks - Supports bases and settings. To the underside of most Bulk horizontal Storage tanks is a series of supporting structures or cradles constructed from the base foundation in brickwork, mass concrete or steel. They are provided so that the load of the tank can be adequately transferred to the base. Heights may vary but the costs are for 1.0m high (at highest point).

Referencing details: -

Cost information notes: For internal lining/painting costs see 215X series. Industrial Usage: plate thickness up to 25m3 = 6mm. 25-70m3 = 8mm. Over 70m3 6-10mm thick depending on gross volume. Horizontal cylindrical - saddle mounted not pressurised, max rating 0.4 bar. Costs exclude saddles (usually 2 steel).

Rateable element: Class 2 List of Accessories (v) Class 1 List of Accessories (1) - storing of fuel for generation of power Class 4 Table 4

Non-rateable element: Class 2 if falls within Class 2 proviso Class 1 if not used in connection with storing of fuel for generation of power Class 4 if Class 4(d) limitation applies i.e. does not exceed 400m3 and readily capable of being moved without substantial demolition of any surrounding structure.

Adjusted plant and machinery: Supports, platforms fixed gantries, staging, settings and foundations

Number of items adjusted: The item can typically be found on an industrial, commercial or office complex. Some hereditaments may have multiple items, in which case the ERC needs to reflect the number of items.

Tanks

CG Code: 215A29

Specific: Large vertical

Descriptive: Refinery, Chemical Works and Tank Farms

Tech 1: Fixed head

Tech 2: 30,000m³

Unit size: -

Unit of measurement: m3

ERC: £85

Superseded codes: -

Location factor: Considered Not Applicable at time of Publication

Description: Large Vertical Cylindrical tanks found on oil refineries, large chemical works and tank farms are generally all steel construction (usually mild steel) with butt-welded shells and tap welded bottoms and roofs – some have fixed roofs, often with an Internal Floating Roof (IFR). This IFR is deemed non-rateable. Others (particularly the largest examples) are fitted with External Floating Roofs (EFRs) – this requires a different design, as such tanks lack the structural stiffness provided where a fixed roof is specified. Consequently, the bodies of these tanks feature additional stiffening in the form of wind girders. In all cases, construction employs pre-formed tank sections laid out on-site and erected over a period of days. These tank sections have usually been treated (painted) with the tank manufacturer's rust-inhibiting coating. It is assumed that these tanks are located on-sites where crude oil, refined petrochemical products and/or aggressive materials are common. More modern tanks may have internal paint coats to prevent such aggressive oils and chemicals from attacking the mild steel plate protection from attack of this nature should be costed using the 215X series. All steel base plates on erected tanks are assumed to be painted with a primer to prevent initial rusting. Costs under 215A series assume the tank has been painted to refinery tank standards. The assumption is that the tanks on refineries and petrochemical works are subject to a 10-year maintenance cycle and the allowance scales for tanks reflects this type of regime. The tanks are assumed to be painted with a product that will last a maintenance period (average 10 years) and the costs reflect this type of paint specification. Foundations under the tanks base plate are bit-sand foundations (see 215J series). The bit-sand base usually sits on an oversite concrete base. Foundations should be costed separately. Where no details of foundations are available, 10% of the cost of the tank sitting on the foundations in question should be adopted as an additional line in the valuation.

Referencing details: 1. External diameter of tank. 2. External height of tank. 3. Material tank is of which the tank is constructed and method of construction (welded or bolted plates

). 4. Painting. 5. Any other known features - internally lined et cetera. 6. Fixed roof (with if without IFR) or External Floating Roof (EFR). 7. Age of construction and refurbishment date.

Cost information notes: These costs include external painting. Costs do not include for bitsand foundations, concrete and/or concrete - pile foundations, heating coils, insulation (rock wool), linings (butyl), structural stairways, catwalks, between tank walkways, etc. Further additions: - It is assumed that the outside of the tank is painted with a general long life paint and the internal tank is painted with a holding primer - for internal painting costs see 215X series.

Rateable element: Usually Class 4, Table 4 – however, tanks may be found in duties covered by both Class 2 (d) Draining ; (e) Supplying Water ; (f) Protection from hazards; List of Accessories 2 and Class 1 List of Accessories 1and 2.

Non-rateable element: If under Class 2, whole if Class 2 provisos applies - other than. If under Class 4 Heating coils, rock wool insulation, paddles. Whole if Class 4 (d)

Adjusted plant and machinery: Foundations, catwalks, bunds, piles, fire protection equipment, high-level walkways.

Number of items adjusted: The item can typically be found on an industrial, commercial or office complex. Some hereditaments may have multiple items, in which case the ERC needs to reflect the number of items.

Tanks

CG Code: 215A66

Specific: Large vertical

Descriptive: Refinery, Chemical Works and Tank Farms

Tech 1: Floating head

Tech 2: 30,000m³

Unit size: -

Unit of measurement: m3

ERC: £107

Superseded codes: -

Location factor: Considered Not Applicable at time of Publication

Description: Large Vertical Cylindrical tanks found on oil refineries, large chemical works and tank farms are generally all steel construction (usually mild steel) with butt-welded shells and tap welded bottoms and roofs – some have fixed roofs, often with an Internal Floating Roof (IFR). This IFR is deemed non-rateable. Others (particularly the largest examples) are fitted with External Floating Roofs (EFRs) – this requires a different design, as such tanks lack the structural stiffness provided where a fixed roof is specified. Consequently, the bodies of these tanks feature additional stiffening in the form of wind girders. In all cases, construction employs pre-formed tank sections laid out on-site and erected over a period of days. These tank sections have usually been treated (painted) with the tank manufacturer's rust-inhibiting coating. It is assumed that these tanks are located on-sites where crude oil, refined petrochemical products and/or aggressive materials are common. More modern tanks may have internal paint coats to prevent such aggressive oils and chemicals from attacking the mild steel plate protection from attack of this nature should be costed using the 215X series. All steel base plates on erected tanks are assumed to be painted with a primer to prevent initial rusting. Costs under 215A series assume the tank has been painted to refinery tank standards. The assumption is that the tanks on refineries and petrochemical works are subject to a 10-year maintenance cycle and the allowance scales for tanks reflects this type of regime. The tanks are assumed to be painted with a product that will last a maintenance period (average 10 years) and the costs reflect this type of paint specification. Foundations under the tanks base plate are bit-sand foundations (see 215J series). The bit-sand base usually sits on an oversite concrete base. Foundations should be costed separately. Where no details of foundations are available, 10% of the cost of the tank sitting on the foundations in question should be adopted as an additional line in the valuation.

Referencing details: 1. External diameter of tank. 2. External height of tank. 3. Material tank is of which the tank is constructed and method of construction (welded or bolted plates

). 4. Painting. 5. Any other known features - internally lined et cetera. 6. Fixed roof (with if without IFR) or External Floating Roof (EFR). 7. Age of construction and refurbishment date.

Cost information notes: These costs include external painting. Costs do not include for bitsand foundations, concrete and/or concrete - pile foundations, heating coils, insulation (rock wool), linings (butyl), structural stairways, catwalks, between tank walkways, etc. Further additions: - It is assumed that the outside of the tank is painted with a general long life paint and the internal tank is painted with a holding primer - for internal painting costs see 215X series.

Rateable element: Usually Class 4, Table 4 – however, tanks may be found in duties covered by both Class 2 (d) Draining ; (e) Supplying Water ; (f) Protection from hazards; List of Accessories 2 and Class 1 List of Accessories 1and 2.

Non-rateable element: If under Class 2, whole if Class 2 provisos applies - other than. If under Class 4 Heating coils, rock wool insulation, paddles. Whole if Class 4 (d)

Adjusted plant and machinery: Foundations, catwalks, bunds, piles, fire protection equipment, high-level walkways.

Number of items adjusted: The item can typically be found on an industrial, commercial or office complex. Some hereditaments may have multiple items, in which case the ERC needs to reflect the number of items.

Contract size adjustment: See Appendix BEAMS Note 1

Consequently, the bodies of these tanks feature additional stiffening in the form of wind girders. In all cases, construction employs pre-formed tank sections laid out on-site and erected over a period of days. These tank sections have usually been treated (painted) with the tank manufacturer's rust-inhibiting coating. It is assumed that these tanks are located on-sites where crude oil, refined petrochemical products and/or aggressive materials are common. More modern tanks may have internal paint coats to prevent such aggressive oils and chemicals from attacking the mild steel plate protection from attack of this nature should be costed using the 215X series. All steel base plates on erected tanks are assumed to be painted with a primer to prevent initial rusting. Costs under 215A series assume the tank has been painted to refinery tank standards. The assumption is that the tanks on refineries and petrochemical works are subject to a 10-year maintenance cycle and the allowance scales for tanks reflects this type of regime. The tanks are assumed to be painted with a product that will last a maintenance period (average 10 years) and the costs reflect this type of paint specification. Foundations under the tanks base plate are bit-sand foundations (see 215J series). The bit-sand base usually sits on an oversite concrete base. Foundations should be costed separately. Where no details of foundations are available, 10% of the cost of the tank sitting on the foundations in question should be adopted as an additional line in the valuation.

Referencing details: 1. External diameter of tank. 2. External height of tank. 3. Material tank is of which the tank is constructed and method of construction (welded or bolted plates

). 4. Painting. 5. Any other known features - internally lined et cetera. 6. Fixed roof (with if without IFR) or External Floating Roof (EFR). 7. Age of construction and refurbishment date.

Cost information notes: These costs include external painting. Costs do not include for bitsand foundations, concrete and/or concrete - pile foundations, heating coils, insulation (rock wool), linings (butyl), structural stairways, catwalks, between tank walkways, etc. Further additions: - It is assumed that the outside of the tank is painted with a general long life paint and the internal tank is painted with a holding primer - for internal painting costs see 215X series.

Rateable element: Usually Class 4, Table 4 – however, tanks may be found in duties covered by both Class 2 (d) Draining ; (e) Supplying Water ; (f) Protection from hazards; List of Accessories 2 and Class 1 List of Accessories 1and 2.

Non-rateable element: If under Class 2, whole if Class 2 provisos applies - other than. If under Class 4 Heating coils, rock wool insulation, paddles. Whole if Class 4 (d)

Adjusted plant and machinery: Foundations, catwalks, bunds, piles, fire protection equipment, high-level walkways.

Number of items adjusted: The item can typically be found on an industrial, commercial or office complex. Some hereditaments may have multiple items, in which case the ERC needs to reflect the number of items.

Contract size adjustment: See Appendix BEAMS Note 1

Description: Large Vertical Cylindrical tanks found on oil refineries, large chemical works and tank farms are generally all steel construction (usually mild steel) with butt-welded shells and tap welded bottoms and roofs – some have fixed roofs, often with an Internal Floating Roof (IFR). This IFR is deemed non-rateable. Others (particularly the largest examples) are fitted with External Floating Roofs (EFRs) – this requires a different design, as such tanks lack the structural stiffness provided where a fixed roof is specified. Consequently, the bodies of these tanks feature additional stiffening in the form of wind girders. In all cases, construction employs pre-formed tank sections laid out on-site and erected over a period of days. These tank sections have usually been treated (painted) with the tank manufacturer's rust-inhibiting coating. It is assumed that these tanks are located on-sites where crude oil, refined petrochemical products and/or aggressive materials are common. Tanks

CG Code: 215X01

Specific: Linings

Descriptive: Painted Linings to Steel Tanks

Tech 1: Crude Oil, Water, and Sewage

Tech 2: 250m³ - 750m³ tank volume

Unit size: -

Unit of measurement: m3

ERC: £68

Superseded codes: -

Location factor: Considered Not Applicable at time of Publication

Description: Tanks - Linings Internal Tanks are all steel construction (usually mild steel) with butt-welded shells and tap welded bottoms and roofs. Usually erected on-site with bit sand foundation under base plate. The whole tanks or tank plates come to site blast-cleaned and covered in a holding primer. This prevents re rusting during construction however where heat is used in welding the plates further painting is required. External and Internal linings (painting or physical linings) have to be added to each tank depending on what it is intended to hold, the provision of internal linings are undertaken by specialist paint manufacturers. The costs for EXTERNAL painting are included in the ERC. Adjustments are required if the tank is galvanised. Internal tank coatings are varied depending on the product stored. Cost Information - lining costs are similar for the various products stored in tanks. (i) Crude oil, heavy fuel, potable water, cold water, sewage water, beverages - milk and food products although having different (ii) Animal and vegetable oils, petrol and petroleum by-products Benzenes and light oils) (aliphatic and aromatic hydrocarbons) require slightly more costly linings. (iii) Aggressive acids, (vinegar) abrasive chemicals and hot water over 95°C require specialised epoxy resin primers and flaked glass in polyester to resist corrosion. (iv) Abrasive chemicals and aggressive chemicals (hydrochloric acid) require soft natural rubber, butyl soft rubber or hard ebonite to resist the product damaging the tank.

Referencing details: Needs internal volume of tank in m3 and operating temperature as well as nature of contents which will determine the type of lining

Cost information notes: Costs assume that the occupier has several tanks that require painting and takes account of the contractor on costs in planning and providing site services to the painting contractor. Where there is clearly a mixture of tank uses, as on a commercial tank farm variations in tank internal painting should be reflected.

Rateable element: Tanks: Class 4, Table 4 Class 4(b) Integral part of the tank structure

ERC: £16

Superseded codes: -

Location factor: Considered Not Applicable at time of Publication

Description: Tanks - Linings Internal Tanks are all steel construction (usually mild steel) with butt-welded shells and tap welded bottoms and roofs. Usually erected on-site with bit sand foundation under base plate. The whole tanks or tank plates come to site blast-cleaned and covered in a holding primer. This prevents re rusting during construction however where heat is used in welding the plates further painting is required. External and Internal linings (painting or physical linings) have to be added to each tank depending on what it is intended to hold, the provision of internal linings are undertaken by specialist paint manufacturers. The costs for EXTERNAL painting are included in the ERC. Adjustments are required if the tank is galvanised. Internal tank coatings are varied depending on the product stored. Cost Information - lining costs are similar for the various products stored in tanks. (i) Crude oil, heavy fuel, potable water, cold water, sewage water, beverages - milk and food products although having different (ii) Animal and vegetable oils, petrol and petroleum by-products Benzenes and light oils) (aliphatic and aromatic hydrocarbons) require slightly more costly linings. (iii) Aggressive acids, (vinegar) abrasive chemicals and hot water over 95°C require specialised epoxy resin primers and flaked glass in polyester to resist corrosion. (iv) Abrasive chemicals and aggressive chemicals (hydrochloric acid) require soft natural rubber, butyl soft rubber or hard ebonite to resist the product damaging the tank.

Referencing details: Needs internal volume of tank in m3 and operating temperature as well as nature of contents which will determine the type of lining

Cost information notes: Costs assume that the occupier has several tanks that require painting and takes account of the contractor on costs in planning and providing site services to the painting contractor. Where there is clearly a mixture of tank uses, as on a commercial tank farm variations in tank internal painting should be reflected.

Rateable element: Tanks: Class 4, Table 4 Class 4(b) Integral part of the tank structure

Non-rateable element: -

Adjusted plant and machinery: Foundations, catwalks, bunds. Deep piles. Fire protection equipment.

Number of items adjusted: The item can typically be found on an industrial, commercial or office complex. Some hereditaments may have multiple items, in which case the ERC needs to reflect the number of items.

Contract size adjustment: See Appendix BEAMS Note 1

Variations: Costs do not include for Bitsand foundations, concrete/pile foundations, heating coils, insulation (rock wool), ladder

Tanks

CG Code: 215X07

This prevents re rusting during construction however where heat is used in welding the plates further painting is required. External and Internal linings (painting or physical linings) have to be added to each tank depending on what it is intended to hold, the provision of internal linings are undertaken by specialist paint manufacturers. The costs for EXTERNAL painting are included in the ERC. Adjustments are required if the tank is galvanised. Internal tank coatings are varied depending on the product stored. Cost Information - lining costs are similar for the various products stored in tanks. (i) Crude oil, heavy fuel, potable water, cold water, sewage water, beverages - milk and food products although having different (ii) Animal and vegetable oils, petrol and petroleum by-products Benzenes and light oils) (aliphatic and aromatic hydrocarbons) require slightly more costly linings. (iii) Aggressive acids, (vinegar) abrasive chemicals and hot water over 95°C require specialised epoxy resin primers and flaked glass in polyester to resist corrosion. (iv) Abrasive chemicals and aggressive chemicals (hydrochloric acid) require soft natural rubber, butyl soft rubber or hard ebonite to resist the product damaging the tank.

Referencing details: Needs internal volume of tank in m3 and operating temperature as well as nature of contents which will determine the type of lining

Cost information notes: Costs assume that the occupier has several tanks that require painting and takes account of the contractor on costs in planning and providing site services to the painting contractor. Where there is clearly a mixture of tank uses, as on a commercial tank farm variations in tank internal painting should be reflected. Costs do not include for bits and foundations, concrete/pile foundations, heating coils, insulation (rock wool), ladders, catwalks etc. These costs assume the outside of the tank is painted with a general long life paint and the internal tank is painted with a holding primer - for internal painting costs see 215X series

Rateable element: Tanks: Class 4, Table 4 Class 4(b) Integral part of the tank structure

Non-rateable element: -

Adjusted plant and machinery: Foundations, catwalks, bunds. Deep piles. Fire protection equipment.

Number of items adjusted: The item can typically be found on an industrial, commercial or office complex. Some hereditaments may have multiple items, in which case the ERC needs to reflect the number of items.

Contract size adjustment: See Appendix BEAMS Note 1

Tanks

CG Code: 215A67

Specific: Large vertical

Descriptive: Refinery, Chemical Works and Tank Farms

Tech 1: Floating head

Tech 2: 40,000m³

Unit size: -

Unit of measurement: m3

ERC: £103

Superseded codes: -

Location factor: Considered Not Applicable at time of Publication

Description: Large Vertical Cylindrical tanks found on oil refineries, large chemical works and tank farms are generally all steel construction (usually mild steel) with butt-welded shells and tap welded bottoms and roofs – some have fixed roofs, often with an Internal Floating Roof (IFR). This IFR is deemed non-rateable. Others (particularly the largest examples) are fitted with External Floating Roofs (EFRs) – this requires a different design, as such tanks lack the structural stiffness provided where a fixed roof is specified. Consequently, the bodies of these tanks feature additional stiffening in the form of wind girders. In all cases, construction employs pre-formed tank sections laid out on-site and erected over a period of days. These tank sections have usually been treated (painted) with the tank manufacturer's rust-inhibiting coating. It is assumed that these tanks are located on-sites where crude oil, refined petrochemical products and/or aggressive materials are common. More modern tanks may have internal paint coats to prevent such aggressive oils and chemicals from attacking the mild steel plate protection from attack of this nature should be costed using the 215X series. All steel base plates on erected tanks are assumed to be painted with a primer to prevent initial rusting. Costs under 215A series assume the tank has been painted to refinery tank standards. The assumption is that the tanks on refineries and petrochemical works are subject to a 10-year maintenance cycle and the allowance scales for tanks reflects this type of regime. The tanks are assumed to be painted with a product that will last a maintenance period (average 10 years) and the costs reflect this type of paint specification. Foundations under the tanks base plate are bit-sand foundations (see 215J series). The bit-sand base usually sits on an oversite concrete base. Foundations should be costed separately. Where no details of foundations are available, 10% of the cost of the tank sitting on the foundations in question should be adopted as an additional line in the valuation.

Referencing details: 1. External diameter of tank. 2. External height of tank. 3. Material tank is of which the tank is constructed and method of construction (welded or bolted plates

). 4. Painting. 5. Any other known features - internally lined et cetera. 6. Fixed roof (with if without IFR) or External Floating Roof (EFR). 7. Age of construction and refurbishment date.

Cost information notes: These costs include external painting. Costs do not include for bitsand foundations, concrete and/or concrete - pile foundations, heating coils, insulation (rock wool), linings (butyl), structural stairways, catwalks, between tank walkways, etc. Further additions: - It is assumed that the outside of the tank is painted with a general long life paint and the internal tank is painted with a holding primer - for internal painting costs see 215X series.

Rateable element: Usually Class 4, Table 4 – however, tanks may be found in duties covered by both Class 2 (d) Draining ; (e) Supplying Water ; (f) Protection from hazards; List of Accessories 2 and Class 1 List of Accessories 1and 2.

Non-rateable element: If under Class 2, whole if Class 2 provisos applies - other than. If under Class 4 Heating coils, rock wool insulation, paddles. Whole if Class 4 (d)

Adjusted plant and machinery: Foundations, catwalks, bunds, piles, fire protection equipment, high-level walkways.

Number of items adjusted: The item can typically be found on an industrial, commercial or office complex. Some hereditaments may have multiple items, in which case the ERC needs to reflect the number of items.

Contract size adjustment: See Appendix BEAMS Note 1

Foundations under the tanks base plate are bit-sand foundations (see 215J series). The bit-sand base usually sits on an oversite concrete base. Foundations should be costed separately. Where no details of foundations are available, 10% of the cost of the tank sitting on the foundations in question should be adopted as an additional line in the valuation.

Referencing details: 1. External diameter of tank. 2. External height of tank. 3. Material tank is of which the tank is constructed and method of construction (welded or bolted plates

). 4. Painting. 5. Any other known features - internally lined et cetera. 6. Fixed roof (with if without IFR) or External Floating Roof (EFR). 7. Age of construction and refurbishment date.

Cost information notes: These costs include external painting. Costs do not include for bitsand foundations, concrete and/or concrete - pile foundations, heating coils, insulation (rock wool), linings (butyl), structural stairways, catwalks, between tank walkways, etc. Further additions: - It is assumed that the outside of the tank is painted with a general long life paint and the internal tank is painted with a holding primer - for internal painting costs see 215X series.

Rateable element: Usually Class 4, Table 4 – however, tanks may be found in duties covered by both Class 2 (d) Draining ; (e) Supplying Water ; (f) Protection from hazards; List of Accessories 2 and Class 1 List of Accessories 1and 2.

Non-rateable element: If under Class 2, whole if Class 2 provisos applies - other than. If under Class 4 Heating coils, rock wool insulation, paddles. Whole if Class 4 (d)

Adjusted plant and machinery: Foundations, catwalks, bunds, piles, fire protection equipment, high-level walkways.

Number of items adjusted: The item can typically be found on an industrial, commercial or office complex. Some hereditaments may have multiple items, in which case the ERC needs to reflect the number of items.

Contract size adjustment: See Appendix BEAMS Note 1

Description: Large Vertical Cylindrical tanks found on oil refineries, large chemical works and tank farms are generally all steel construction (usually mild steel) with butt-welded shells and tap welded bottoms and roofs – some have fixed roofs, often with an Internal Floating Roof (IFR). This IFR is deemed non-rateable. Others (particularly the largest examples) are fitted with External Floating Roofs (EFRs) – this requires a different design, as such tanks lack the structural stiffness provided where a fixed roof is specified. Consequently, the bodies of these tanks feature additional stiffening in the form of wind girders. In all cases, construction employs pre-formed tank sections laid out on-site and erected over a period of days. These tank sections have usually been treated (painted) with the tank manufacturer's rust-inhibiting coating. It is assumed that these tanks are located on-sites where crude oil, refined petrochemical products and/or aggressive materials are common. More modern tanks may have internal paint coats to prevent such aggressive oils and chemicals from attacking the mild steel plate protection from attack of this nature should be costed using the 215X series. All steel base plates on erected tanks are assumed to be painted with a primer to prevent initial rusting. Costs under 215A series assume the tank has been painted to refinery tank standards. The assumption is that the tanks on refineries and petrochemical works are subject to a 10-year maintenance cycle and the allowance scales for tanks reflects this type of regime. The tanks are assumed to be painted with a product that will last a maintenance period (average 10 years) and the costs reflect this type of paint specification. Foundations under the tanks base plate are bit-sand foundations (see 215J series). The bit-sand base usually sits on an oversite concrete base. Foundations should be costed separately. Where no details of foundations are available, 10% of the cost of the tank sitting on the foundations in question should be adopted as an additional line in the valuation.

Description: Tanks Spheres Looking like a golf ball on a tee these tanks are often referred to as Horton Spheres, named after one of the major manufacturers of these tanks. This tank design used when large quantities of liquid under pressure are required to be stored and are most common in Refineries or large Chemical Works. Where natural gas is not piped to properties or where pure gas of a specific type is required by the manufacturer a single tank may be employed. The tank has to withstand high pressures and often low temperatures (i.e. up to 1000 psig and down to 253Oc) and this results in steel of 25 mm thickness or greater. (Normal thickness is 28 mm for pressures up to 250 psig). The weight of the sphere is high and this is reflected in the size of the leg supports and foundations. When storing liquids that are corrosive specialist alloys or stainless steel is used in the sphere's construction. Alternatively, a specialised lining (such as fibre glass) may be employed.

Referencing details: Weight of steel = 205.5 kg/m2 per 25 mm thick. Although these spheres are low pressure the thickness of steel in the plates increases due to the increase in the volume of the structure.

Cost information notes: To calculate the cost of a sphere: (a) The diameter to calculate the surface area (4 x 22/7 x r2) (b) The thickness of the plate in mm * (c) Conversion factor 7.85 kg. mm thickness / sq m (d) Cost per tonne of steel Cost excludes supports and foundations Cost = surface area x thickness in mm x 7.85 / 1000 x cost of steel * Low pressure 14 to 18 mm: if not known adopt 16 mm Low pressure 22 to 28 mm: if not known adopt 25 mm High pressure 28 to 38 mm: if not known adopt 35 mm

Rateable element: Class 4 Table 4 Tanks (note Class 4 (d)) Class 4 Table 3 Supports (legs) Class 4 Table 3 Foundations.

Non-rateable element: -

Adjusted plant and machinery: Stairways, fire protection, staging, foundations.

Description: Tanks Spheres Looking like a golf ball on a tee these tanks are often referred to as Horton Spheres, named after one of the major manufacturers of these tanks. This tank design used when large quantities of liquid under pressure are required to be stored and are most common in Refineries or large Chemical Works. Where natural gas is not piped to properties or where pure gas of a specific type is required by the manufacturer a single tank may be employed. The tank has to withstand high pressures and often low temperatures (i.e. up to 1000 psig and down to 253Oc) and this results in steel of 25 mm thickness or greater. (Normal thickness is 28 mm for pressures up to 250 psig). The weight of the sphere is high and this is reflected in the size of the leg supports and foundations. When storing liquids that are corrosive specialist alloys or stainless steel is used in the sphere’s construction. Alternatively, a specialised lining (such as fibre glass) may be employed.

Referencing details: Weight of steel = 205.5 kg/m2 per 25 mm thick. Although these spheres are low pressure the thickness of steel in the plates increases due to the increase in the volume of the structure.

Cost information notes: To calculate the cost of a sphere: (a) The diameter to calculate the surface area (4 x 22/7 x r2) (b) The thickness of the plate in mm * (c) Conversion factor 7.85 kg. mm thickness / sq m (d) Cost per tonne of steel Cost excludes supports and foundations Cost = surface area x thickness in mm x 7.85 / 1000 x cost of steel * Low pressure 14 to 18 mm: if not known adopt 16 mm Low pressure 22 to 28 mm: if not known adopt 25 mm High pressure 28 to 38 mm: if not known adopt 35 mm

Rateable element: Class 4 Table 4 Tanks (note Class 4 (d)) Class 4 Table 3 Supports (legs) Class 4 Table 3 Foundations.

Non-rateable element: -

Adjusted plant and machinery: Stairways, fire protection, staging, foundations.

Number of items adjusted: The item can typically be found on an industrial, commercial or office complex. Some hereditaments may have multiple items, in which case the ERC needs to reflect the number of items.

Contract size adjustment: See Appendix BEAMS Note 1

Variations: To calculate the cost of the legs: (a) The weight of the legs in tonnes x cost per tonne of steel.

Tanks

CG Code: 215C107

Specific: Horizontal Pressure Vessels

Descriptive: Refinery, Chemical Works and Tank Farms

Tech 1: Medium Pressure (14 - 20 bar)

Tech 2: 2000m3

Unit size: -

Unit of measurement: Each

ERC: £2,060,054

Superseded codes: -

Location factor: Considered Not Applicable at time of Publication

Description: The tanks situated within Refineries and large Chemical Works are sometimes called BULLETS and are shaped like a cigar: tube shaped, having rounded ends. They are made from mild steel but can be stainless and some are lined depending upon the type of material held. Tubes can be made from other smaller tubes welded together on-site and tested for faults in weld. Pressures may be just above Atmosphere or up to 200 psig. The thickness of steel will generally be more than 25mm and consequently the tank is very heavy (even small ones) the supports and foundations will be large to hold this weight. The thickness of steel and the pressure testing increases the cost as does the on-site time for installation. They hold many substances including unstable crude oil, helium, oxygen and LPG in general. Propane and Butane stored in smaller tanks is often used for power or heat purposes and thus may be rateable under Class 1 or Class 2. The main application for this type of tank is storing smaller quantities of a product. Bulk quantities would be kept in a Horton Sphere: See code series 215B - -. In general Industrial hereditaments smaller pressure tanks are common. Those holding compressed air in conjunction with air compressors are more specifically costed under Air: Receivers. See code series 201B - -.

Referencing details: Industrial Usage Medium Pressure Horizontal cylindrical - saddle mounted 16 Bar Temp Range - 10C to + 50C

Cost information notes: -

Rateable element: Tanks - Class 4, Table 4 Class 1 List of Accessories (1) - storing of fuel for generation of power. Tanks Class 2(b) Heating list of accessories Tanks

Non-rateable element: Whole if under Class 4 the Class 4(d) limitation applies i.e. does not exceed 400m3 and readily capable of being moved without substantial demolition of any surrounding structure Whole under Class 2 "other than¬85"

Adjusted plant and machinery: Stairways, fire protection, staging, foundations.

Number of items adjusted: The item can typically be found on an industrial, commercial or office complex. Some hereditaments may have multiple items, in which case the ERC needs to reflect the number of items.

Unit of measurement: Each

ERC: £5,629

Superseded codes: -

Location factor: Considered Not Applicable at time of Publication

Description: Tanks - Storage Horizontal Cigar shaped tanks found in a single location or in a tank farm above ground. Most likely external fitted with metal supports or in a frame of steel. Catwalks and platforms extra. Used mainly in the chemical/petrol industries size range 500,000 gallons but in many industrial properties used as fuel tanks for Class 1 and 2 items. Diameter and length (of the straight sections not the curved ends) should be measured for looking up the scale below but overall size required for calculating volume. Water tonnage can be calculated with reference to the scales. Made of welded/bolted mild steel but could be stainless or aluminium (see separate scales). Not pressurised. White oxide primed, hydro tested. Costs include external painting. Useful Facts (approximately) Diameter 3.25 ft x 5.5ft = 284 gallons Diameter 12 ft x 44 f = 31,100 gallons 6 ft x 4 ft x 4 f = 600 gallons 12 ft x 10 ft x 9 ft = 6,750 gallons 6 metres diameter x 6 metres = 37,400 gallons 15 metres diameter x 17 metres= 663,000 gallons.

Referencing details: Record length and diameter and capacity (gallons or litres) or m3

Cost information notes: For internal lining/painting costs see 215X series. Industrial Usage: plate thickness up to 25m3 = 6mm. 25-70m3 = 8mm. Over 70m3 6-10mm thick depending on gross volume. Horizontal cylindrical - saddle mounted not pressurised, max rating 0.4 bar. Costs exclude saddles (usually 2 steel).

Rateable element: Class 2 List of Accessories (v) Class 1 List of Accessories (1) - storing of fuel for generation of power Class 4 Table 4

Non-rateable element: Class 2 if falls within Class 2 proviso Class 1 if not used in connection with storing of fuel for generation of power Class 4 if Class 4(d) limitation applies i.e. does not exceed 400m3 and readily capable of being moved without substantial demolition of any surrounding structure.

Adjusted plant and machinery: Supports, platforms fixed gantries, staging, settings and foundations

Specific: Horizontal (not pressure vessels)

Descriptive: Fuel storage

Tech 1: 2.44m diam x 6.20m long

Tech 2: 6mm thick steel

Unit size: -

Unit of measurement: Each

ERC: £16,820

Superseded codes: -

Location factor: Considered Not Applicable at time of Publication

Description: Tanks - Storage Horizontal Cigar shaped tanks found in a single location or in a tank farm above ground. Most likely external fitted with metal supports or in a frame of steel. Catwalks and platforms extra. Used mainly in the chemical/petrol industries size range 500,000 gallons but in many industrial properties used as fuel tanks for Class 1 and 2 items. Diameter and length (of the straight sections not the curved ends) should be measured for looking up the scale below but overall size required for calculating volume. Water tonnage can be calculated with reference to the scales. Made of welded/bolted mild steel but could be stainless or aluminium (see separate scales). Not pressurised. White oxide primed, hydro tested. Costs include external painting. Useful Facts (approximately) Diameter 3.25 ft x 5.5ft = 284 gallons Diameter 12 ft x 44 f = 31,100 gallons 6 ft x 4 ft x 4 f = 600 gallons 12 ft x 10 ft x 9 ft = 6,750 gallons 6 metres diameter x 6 metres = 37,400 gallons 15 metres diameter x 17 metres= 663,000 gallons.

Referencing details: Record length and diameter and capacity (gallons or litres) or m3

Cost information notes: For internal lining/painting costs see 215X series. Industrial Usage: plate thickness up to 25m3 = 6mm. 25-70m3 = 8mm. Over 70m3 6-10mm thick depending on gross volume. Horizontal cylindrical - saddle mounted not pressurised, max rating 0.4 bar. Costs exclude saddles (usually 2 steel).

Rateable element: Class 2 List of Accessories (v) Class 1 List of Accessories (1) - storing of fuel for generation of power Class 4 Table 4

Non-rateable element: Class 2 if falls within Class 2 proviso Class 1 if not used in connection with storing of fuel for generation of power Class 4 if Class 4(d) limitation applies i.e. does not exceed 400m3 and readily capable of being moved without substantial demolition of any surrounding structure.

Adjusted plant and machinery: Supports, platforms fixed gantries, staging, settings and foundations

Number of items adjusted: The item can typically be found on an industrial, commercial or office complex. Some hereditaments may have multiple items, in which case the ERC needs to reflect the number of items.

Contract size adjustment: See Appendix BEAMS Note 1

Tech 1: 6.10m (20ft) x 3.66m (12ft)

Tech 2: -

Unit size: -

Unit of measurement: Each

ERC: £40,942

Superseded codes: -

Location factor: Considered Not Applicable at time of Publication

Description: Tanks - Potable Water - Braithwaite type. Braithwaite is a trade name that is used by the industry for this type of tank. Braithwaite tanks are mainly for water storage and are found sitting on brick or more commonly steel towers. In modern office complexes the tanks may be found on a building roof. Each panel has a distinctive raised pattern looking like a diagonal cross from a distance. Many modern tanks are of steel plate riveted/bolted/welded together with internal cross bracings. Today pitched / domed covers are normal however some open top tanks are produced. Approximate Guide: 6.10m (20ft) x 3.66m (12ft) x 1.22m (4ft) deep = 6,000 gallons; 12.19m (40ft) x 9.75m (32) x 3.66m (12 ft) deep = 96,000 gallons; 15.85m (52ft) x 15.85m (52ft) x 4.88m (16ft) deep = 270,000 gallons. Plate Sizes:1.22m (4ft) x 1.22m (4ft) or 0.91m (3ft) x 0.91m (3ft). Plate Thickness: Usually 47mm (3/16) to 6.3mm (1/4). Conversions:1.82m3 (64 cubic feet) = 400 gallons; 1m3 = 1000 litres.

Referencing details: The tank supports and foundations should be noted. Calculate volume, note design, what tank contains and age.

Cost information notes: The height of the tank influences cost, so two tanks with the same volume but different shapes may not cost the same. The cost build up includes for plates wire brushed and bitumen painted internally / externally with all necessary, stays, cleats, nuts, bolts, sealing strips etc. Additions are required for: - Foundations, Support Structure and Pipe Work.

Rateable element: Supplying Water - Class 2, Table 2(e) Fire Protection - Class 2, Table 2(f) Accessories to Classes 1 and 2- List of Accessories (1) and (2)(v).

Non-rateable element: Class 2 proviso, i.e. used in connection with manufacturing operations or trade processes. Class 4 exception (d).

Adjusted plant and machinery: Foundations, Supports, Land Wells, Pumps, Boilers, Fire protection system.

Number of items adjusted: The item can typically be found on an industrial, commercial or office complex. Some hereditaments may have multiple items, in which case the ERC needs to reflect the number of items.

Contract size adjustment: See Appendix BEAMS Note 1

Variations: Galvanised tanks require a 15% addition to Cost guide figures.

Description: Tanks - Potable Water - Braithwaite type. Braithwaite is a trade name that is used by the industry for this type of tank. Braithwaite tanks are mainly for water storage and are found sitting on brick or more commonly steel towers. In modern office complexes the tanks may be found on a building roof. Each panel has a distinctive raised pattern looking like a diagonal cross from a distance. Many modern tanks are of steel plate riveted/bolted/welded together with internal cross bracings. Today pitched / domed covers are normal however some open top tanks are produced. Approximate Guide: 6.10m (20ft) x 3.66m (12ft) x 1.22m (4ft) deep = 6,000 gallons; 12.19m (40ft) x 9.75m (32) x 3.66m (12 ft) deep = 96,000 gallons; 15.85m (52ft) x 15.85m (52ft) x 4.88m (16ft) deep = 270,000 gallons. Plate Sizes:1.22m (4ft) x 1.22m (4ft) or 0.91m (3ft) x 0.91m (3ft). Plate Thickness: Usually 47mm (3/16) to 6.3mm (1/4). Conversions:1.82m3 (64 cubic feet) = 400 gallons; 1m3 = 1000 litres.

Referencing details: The tank supports and foundations should be noted. Calculate volume, note design, what tank contains and age.

Cost information notes: The height of the tank influences cost, so two tanks with the same volume but different shapes may not cost the same. The cost build up includes for plates wire brushed and bitumen painted internally / externally with all necessary, stays, cleats, nuts, bolts, sealing strips etc. Additions are required for: - Foundations, Support Structure and Pipe Work.

Rateable element: Supplying Water - Class 2, Table 2(e) Fire Protection - Class 2, Table 2(f) Accessories to Classes 1 and 2- List of Accessories (1) and (2)(v).

Non-rateable element: Class 2 proviso, i.e. used in connection with manufacturing operations or trade processes. Class 4 exception (d).

Adjusted plant and machinery: Foundations, Supports, Land Wells, Pumps, Boilers, Fire protection system.

Number of items adjusted: The item can typically be found on an industrial, commercial or office complex. Some hereditaments may have multiple items, in which case the ERC needs to reflect the number of items.

Contract size adjustment: See Appendix BEAMS Note 1

Variations: Galvanised tanks require a 15% addition to Cost guide figures.

Each panel has a distinctive raised pattern looking like a diagonal cross from a distance. Many modern tanks are of steel plate riveted/bolted/welded together with internal cross bracings. Today pitched / domed covers are normal however some open top tanks are produced. Approximate Guide: 6.10m (20ft) x 3.66m (12ft) x 1.22m (4ft) deep = 6,000 gallons; 12.19m (40ft) x 9.75m (32) x 3.66m (12 ft) deep = 96,000 gallons; 15.85m (52ft) x 15.85m (52ft) x 4.88m (16ft) deep = 270,000 gallons. Plate Sizes:1.22m (4ft) x 1.22m (4ft) or 0.91m (3ft) x 0.91m (3ft). Plate Thickness: Usually 47mm (3/16) to 6.3mm (1/4). Conversions:1.82m3 (64 cubic feet) = 400 gallons; 1m3 = 1000 litres.

Referencing details: The tank supports and foundations should be noted. Calculate volume, note design, what tank contains and age.

Cost information notes: The height of the tank influences cost, so two tanks with the same volume but different shapes may not cost the same. The cost build up includes for plates wire brushed and bitumen painted internally / externally with all necessary, stays, cleats, nuts, bolts, sealing strips etc. Additions are required for: - Foundations, Support Structure and Pipe Work.

Rateable element: Supplying Water - Class 2, Table 2(e) Fire Protection - Class 2, Table 2(f) Accessories to Classes 1 and 2- List of Accessories (1) and (2)(v).

Non-rateable element: Class 2 proviso, i.e. used in connection with manufacturing operations or trade processes. Class 4 exception (d).

Adjusted plant and machinery: Foundations, Supports, Land Wells, Pumps, Boilers, Fire protection system.

Number of items adjusted: The item can typically be found on an industrial, commercial or office complex. Some hereditaments may have multiple items, in which case the ERC needs to reflect the number of items.

Contract size adjustment: See Appendix BEAMS Note 1

Variations: Galvanised tanks require a 15% addition to Cost guide figures.

Approximate Guide: 6.10m (20ft) x 3.66m (12ft) x 1.22m (4ft) deep = 6,000 gallons; 12.19m (40ft) x 9.75m (32) x 3.66m (12 ft) deep = 96,000 gallons; 15.85m (52ft) x 15.85m (52ft) x 4.88m (16ft) deep = 270,000 gallons. Plate Sizes:1.22m (4ft) x 1.22m (4ft) or 0.91m (3ft) x 0.91m (3ft). Plate Thickness: Usually 47mm (3/16) to 6.3mm (1/4). Conversions:1.82m3 (64 cubic feet) = 400 gallons; 1m3 = 1000 litres.

Referencing details: The tank supports and foundations should be noted. Calculate volume, note design, what tank contains and age.

Cost information notes: The height of the tank influences cost, so two tanks with the same volume but different shapes may not cost the same. The cost build up includes for plates wire brushed and bitumen painted internally / externally with all necessary, stays, cleats, nuts, bolts, sealing strips etc. Additions are required for: - Foundations, Support Structure and Pipe Work.

Rateable element: Supplying Water - Class 2, Table 2(e) Fire Protection - Class 2, Table 2(f) Accessories to Classes 1 and 2- List of Accessories (1) and (2)(v).

Non-rateable element: Class 2 proviso, i.e. used in connection with manufacturing operations or trade processes. Class 4 exception (d).

Adjusted plant and machinery: Foundations, Supports, Land Wells, Pumps, Boilers, Fire protection system.

Number of items adjusted: The item can typically be found on an industrial, commercial or office complex. Some hereditaments may have multiple items, in which case the ERC needs to reflect the number of items.

Contract size adjustment: See Appendix BEAMS Note 1

Variations: Galvanised tanks require a 15% addition to Cost guide figures.

Tanks

CG Code: 215F27

Specific: Braithwaite

Description: Tanks - Potable Water - Braithwaite type. Braithwaite is a trade name that is used by the industry for this type of tank. Braithwaite tanks are mainly for water storage and are found sitting on brick or more commonly steel towers. In modern office complexes the tanks may be found on a building roof. Each panel has a distinctive raised pattern looking like a diagonal cross from a distance. Many modern tanks are of steel plate riveted/bolted/welded together with internal cross bracings. Today pitched / domed covers are normal however some open top tanks are produced. Approximate Guide: 6.10m (20ft) x 3.66m (12ft) x 1.22m (4ft) deep = 6,000 gallons; 12.19m (40ft) x 9.75m (32) x 3.66m (12 ft) deep = 96,000 gallons; 15.85m (52ft) x 15.85m (52ft) x 4.88m (16ft) deep = 270,000 gallons. Plate Sizes:1.22m (4ft) x 1.22m (4ft) or 0.91m (3ft) x 0.91m (3ft). Plate Thickness: Usually 47mm (3/16) to 6.3mm (1/4). Conversions:1.82m3 (64 cubic feet) = 400 gallons; 1m3 = 1000 litres.

Tanks

CG Code: 215G01

Specific: Vertical (Cylindrical)

Descriptive: Carbon Steel

Tech 1: Not pressurised; Flat Bottom

Tech 2: 1.98m diam x 4.57m ht; 1.6 tonnes

Unit size: -

Unit of measurement: Each

ERC: £13,187

Superseded codes: -

Location factor: Considered Not Applicable at time of Publication

Description: Tanks Storage – Vertical. Similar to storage horizontal but, whereas the horizontal tanks are laid on cradles or structural steelwork, most vertical tanks sit on their own foundations. Flat base found in a single location or on a tank farm and can be in a tank complex or single free standing. May be supported by a skirt. They contain a variety of products but nothing under pressure. They may be steam heated or electrically heated. Made of mild steel 5mm - 6mm thick welded/bolted however depending on product stored could be produced in stainless steel/aluminium. Although small and would not normally be rated under Class 4 due to the provisions of (d) they are rateable under Class 1 or 2, irrespective of size and the accessories regarding storage of fuel for power plant or liquids for the service sections. Storage ranges 1,000-30,000 gallons. For large class 4 storage tanks see: 215A-- & 215W-- Refinery, Chemical Works and Tank Farms.

Referencing details: Diameter and height of tank together with weight in tonnes of tank (or plate thickness to enable weight to be calculated).

Cost information notes: -

Rateable element: Class 1 and Class 2 Accessories (1) and (2)(v) Class 2(f) Class 4 Table 4

Non-rateable element: If Class 2 proviso applies Whole if under Class 4 and Class 4(d) limitation applies i.e. does not exceed 400m3 and is readily capable of being moved without substantial demolition to surrounding structures.

Adjusted plant and machinery: Foundations, settings, platforms, staging for plant and machinery.

Number of items adjusted: The item can typically be found on an industrial, commercial or office complex. Some hereditaments may have multiple items, in which case the ERC needs to reflect the number of items.

Unit size: -

Unit of measurement: Each

ERC: £57,138

Superseded codes: -

Location factor: Considered Not Applicable at time of Publication

Description: Tanks Storage – Vertical. Similar to storage horizontal but, whereas the horizontal tanks are laid on cradles or structural steelwork, most vertical tanks sit on their own foundations. Flat base found in a single location or on a tank farm and can be in a tank complex or single free standing. May be supported by a skirt. They contain a variety of products but nothing under pressure. They may be steam heated or electrically heated. Made of mild steel 5mm - 6mm thick welded/bolted however depending on product stored could be produced in stainless steel/aluminium. Although small and would not normally be rated under Class 4 due to the provisions of (d) they are rateable under Class 1 or 2, irrespective of size and the accessories regarding storage of fuel for power plant or liquids for the service sections. Storage ranges 1,000-30,000 gallons. For large class 4 storage tanks see: 215A-- & 215W-- Refinery, Chemical Works and Tank Farms.

Referencing details: Diameter and height of tank together with weight in tonnes of tank (or plate thickness to enable weight to be calculated).

Cost information notes: -

Rateable element: Class 1 and Class 2 Accessories (1) and (2)(v) Class 2(f) Class 4 Table 4

Tanks

CG Code: 215C102

Specific: Horizontal Pressure Vessels

Descriptive: Refinery, Chemical Works and Tank Farms

Tech 1: Medium Pressure (14 - 20 bar)

Tech 2: 400m3

Unit size: -

Unit of measurement: Each

ERC: £163,445

Superseded codes: -

Location factor: Considered Not Applicable at time of Publication

Description: The tanks situated within Refineries and large Chemical Works are sometimes called BULLETS and are shaped like a cigar: tube shaped, having rounded ends. They are made from mild steel but can be stainless and some are lined depending upon the type of material held. Tubes can be made from other smaller tubes welded together on-site and tested for faults in weld. Pressures may be just above Atmosphere or up to 200 psig. The thickness of steel will generally be more than 25mm and consequently the tank is very heavy (even small ones) the supports and foundations will be large to hold this weight. The thickness of steel and the pressure testing increases the cost as does the on-site time for installation. They hold many substances including unstable crude oil, helium, oxygen and LPG in general. Propane and Butane stored in smaller tanks is often used for power or heat purposes and thus may be rateable under Class 1 or Class 2. The main application for this type of tank is storing smaller quantities of a product. Bulk quantities would be kept in a Horton Sphere: See code series 215B - -. In general Industrial hereditaments smaller pressure tanks are common. Those holding compressed air in conjunction with air compressors are more specifically costed under Air: Receivers. See code series 201B - -.

Referencing details: Industrial Usage Medium Pressure Horizontal cylindrical - saddle mounted 16 Bar Temp Range - 10C to + 50C

Cost information notes: -

Rateable element: Tanks - Class 4, Table 4 Class 1 List of Accessories (1) - storing of fuel for generation of power. Tanks Class 2(b) Heating list of accessories Tanks

Non-rateable element: Whole if under Class 4 the Class 4(d) limitation applies i.e. does not exceed 400m3 and readily capable of being moved without substantial demolition of any surrounding structure Whole under Class 2 "other than¬85"

Adjusted plant and machinery: Stairways, fire protection, staging, foundations.

Number of items adjusted: The item can typically be found on an industrial, commercial or office complex. Some hereditaments may have multiple items, in which case the ERC needs to reflect the number of items.

Tanks

CG Code: 215G12

Specific: Vertical (Cylindrical)

Descriptive: Stainless Steel; SS316 = Food products or highly corrosive

Tech 1: Flat Bottom; 4mm plate

Tech 2: 2.4m diam x 5.75m ht x 1.75 tonnes

Unit size: -

Unit of measurement: Each

ERC: £48,217

Superseded codes: -

Location factor: Considered Not Applicable at time of Publication

Description: This type of tank is usually intended for processed product storage and normally does not exceed 25,000 cu m in volume. They may hold contain either food products (e.g. milk, beer) or aggressive chemicals like dilute acids or alkalis. Such tanks are usually found on commercial tank farms together with individual tanks or clusters of tanks on a range of industrial sites, including chemical works, food manufacturing and breweries. Generally all stainless steel, these tanks are similar in construction and design to mild steel fixed-head tanks. However, their weight pro rata to steel thickness is greater and careful referencing of foundation detail is required. They are usually erected on-site built over an existing bit sand foundation (formed under the tank base plate). The bit sand cone is usually formed on an over site concrete base. The costs provided in this Cost Guide are for fixed head tanks - roofs are conical or domed and self-supporting, being made of 5 mm stainless steel plates welded at the edges. These tanks are usually purpose designed by the operator and built to their specification. The design life is at minimum 30 years , so whilst they are initially more expensive to purchase than equivalent mild steel tanks their maintenance costs are lower. Stainless steel contains a high percentage of nickel, the market price of which will often vary according to a pattern different from that of steel. There are a few large tank manufacturers who are able to buy stainless steel when the price is low and stockpile large plates for future use, whilst any of the smaller companies have limited stocks and often buy to order. The price of individual items can therefore vary considerably . Working with stainless steel is harder than with mild steel and thus where shapes and designs are complex the cost increases dramatically. For Bulk Liquid storage tanks (as found on commercial tank farms) the assumption is that they have been purchased from a leading stainless steel manufacturer and that the design is that of a typical tank in this use. Most bulk storage tanks are built with a cone-up centre - however some tanks have a sump in the centre of the tank. In the usual cone up situation the foundations to the tank should be established by reference to plans and sections and costed with reference to BEAMS. Additions for Foundations - For small tanks the addition for this type of foundation will be some 12% whereas for larger tanks a 9% addition is required. A 10% addition for

foundations is therefore proposed to ALL BULK STORAGE TANKS where individual costings are not possible. Pro rata with Mild Steel tanks the amount for foundations will be higher reflecting the greater weight in the tank construction. FOUNDATIONS to Bulk Storage Tanks where site details are not known 10% ADDITION to basic tank costs. Notes on Foundations - In some cases the chemically inert fill layer may consist of concrete up to 100mm deep. The 10% addition is still applicable in these cases. For piled and thicker raft foundations under the tank a further addition will be required and these should be calculated with reference to the relevant section in the Cost Guide or after discussion with the BEAMS.

Referencing details: Costs do not include for Bitsand foundations, concrete/pile foundations, heating coils, insulation, structural stairways, catwalks, between tank walkways, et cetera. Stairways that are structures in their own right should be rated (costed and valued) following Class 4 Table 3 stairways. These stairways are for example where spot brackets welded to the tank support the item. In the case where every rung of the staircase is welded to the tank these staircases are NOT rateable as they are not staircases in their own right (Class 4 Table 3) and they do not form an integral part of such an item see Class 4 (b) i.e. they are not part of the structure of the tank. Stairways are usually mild steel, which has been galvanised.

Cost information notes: Cost Information Notes: The Cost figures are for Stainless Steel tanks having up to 6 mm thick bottom plates. The scales are suitable to tanks having bottom plate thicknesses of between 5 mm and 8 mm. Tanks with bottom plates of + 8 mm thickness may have an addition of up to 40% to account for extra costs.

Rateable element: Tanks - Class 4, Table 4 Class 2(d) Draining (e) Supplying Water (f) Protection from hazards. List of accessories 1 and 2 (v)

Non-rateable element: If Class 2 proviso applies Whole if under Class 4 and Class 4(d) limitation applies i.e. does not exceed 400m3 and is readily capable of being moved without substantial demolition to surrounding structures.

Adjusted plant and machinery: Foundations, catwalks, bunds, structural staircases, piles, fire protection equipment, high-level walkways

Number of items adjusted: The item can typically be found on an industrial, commercial or office complex. Some hereditaments may have multiple items, in which case the ERC needs to reflect the number of items.

The price of individual items can therefore vary considerably . Working with stainless steel is harder than with mild steel and thus where shapes and designs are complex the cost increases dramatically. For Bulk Liquid storage tanks (as found on commercial tank farms) the assumption is that they have been purchased from a leading stainless steel manufacturer and that the design is that of a typical tank in this use. Most bulk storage tanks are built with a cone-up centre - however some tanks have a sump in the centre of the tank. In the usual cone up situation the foundations to the tank should be established by reference to plans and sections and costed with reference to BEAMS. Additions for Foundations - For small tanks the addition for this type of foundation will be some 12% whereas for larger tanks a 9% addition is required. A 10% addition for

foundations is therefore proposed to ALL BULK STORAGE TANKS where individual costings are not possible. Pro rata with Mild Steel tanks the amount for foundations will be higher reflecting the greater weight in the tank construction. FOUNDATIONS to Bulk Storage Tanks where site details are not known 10% ADDITION to basic tank costs. Notes on Foundations - In some cases the chemically inert fill layer may consist of concrete up to 100mm deep. The 10% addition is still applicable in these cases. For piled and thicker raft foundations under the tank a further addition will be required and these should be calculated with reference to the relevant section in the Cost Guide or after discussion with the BEAMS.

Referencing details: Costs do not include for Bitsand foundations, concrete/pile foundations, heating coils, insulation, structural stairways, catwalks, between tank walkways, et cetera. Stairways that are structures in their own right should be rated (costed and valued) following Class 4 Table 3 stairways. These stairways are for example where spot brackets welded to the tank support the item. In the case where every rung of the staircase is welded to the tank these staircases are NOT rateable as they are not staircases in their own right (Class 4 Table 3) and they do not form an integral part of such an item see Class 4 (b) i.e. they are not part of the structure of the tank. Stairways are usually mild steel, which has been galvanised.

Cost information notes: Cost Information Notes: The Cost figures are for Stainless Steel tanks having up to 6 mm thick bottom plates. The scales are suitable to tanks having bottom plate thicknesses of between 5 mm and 8 mm. Tanks with bottom plates of + 8 mm thickness may have an addition of up to 40% to account for extra costs.

Rateable element: Tanks - Class 4, Table 4 Class 2(d) Draining (e) Supplying Water (f) Protection from hazards. List of accessories 1 and 2 (v)

Non-rateable element: If Class 2 proviso applies Whole if under Class 4 and Class 4(d) limitation applies i.e. does not exceed 400m3 and is readily capable of being moved without substantial demolition to surrounding structures.

Adjusted plant and machinery: Foundations, catwalks, bunds, structural staircases, piles, fire protection equipment, high-level walkways

Number of items adjusted: The item can typically be found on an industrial, commercial or office complex. Some hereditaments may have multiple items, in which case the ERC needs to reflect the number of items.

Contract size adjustment: See Appendix BEAMS Note 1

Tanks

CG Code: 215G16

Specific: Vertical (Cylindrical)

Descriptive: Stainless Steel; SS316 = Food products or highly corrosive

Tech 1: Flat Bottom; 5mm plate

Tech 2: 3.82m diam x 9.4m ht x 5.45 tonnes

Unit size: -

Unit of measurement: Each

ERC: £148,123

Superseded codes: -

Location factor: Considered Not Applicable at time of Publication

Description: This type of tank is usually intended for processed product storage and normally does not exceed 25,000 cu m in volume. They may hold contain either food products (e.g. milk, beer) or aggressive chemicals like dilute acids or alkalis. Such tanks are usually found on commercial tank farms together with individual tanks or clusters of tanks on a range of industrial sites, including chemical works, food manufacturing and breweries. Generally all stainless steel, these tanks are similar in construction and design to mild steel fixed-head tanks. However, their weight pro rata to steel thickness is greater and careful referencing of foundation detail is required. They are usually erected on-site built over an existing bit sand foundation (formed under the tank base plate). The bit sand cone is usually formed on an over site concrete base. The costs provided in this Cost Guide are for fixed head tanks - roofs are conical or domed and self-supporting, being made of 5 mm stainless steel plates welded at the edges. These tanks are usually purpose designed by the operator and built to their specification. The design life is at minimum 30 years , so whilst they are initially more expensive to purchase than equivalent mild steel tanks their maintenance costs are lower. Stainless steel contains a high percentage of nickel, the market price of which will often vary according to a pattern different from that of steel. There are a few large tank manufacturers who are able to buy stainless steel when the price is low and stockpile large plates for future use, whilst any of the smaller companies have limited stocks and often buy to order. The price of individual items can therefore vary considerably . Working with stainless steel is harder than with mild steel and thus where shapes and designs are complex the cost increases dramatically. For Bulk Liquid storage tanks (as found on commercial tank farms) the assumption is that they have been purchased from a leading stainless steel manufacturer and that the design is that of a typical tank in this use. Tanks

CG Code: 215G51

Specific: Vertical (Cylindrical)

Descriptive: Carbon Steel

Tech 1: Not pressurised; Including skirt

Tech 2: 1.98m diam x 4.57m ht; 1.6 tonnes

Unit size: -

Unit of measurement: Each

ERC: £15,325

Superseded codes: -

Location factor: Considered Not Applicable at time of Publication

Description: Tanks Storage – Vertical. Similar to storage horizontal but, whereas the horizontal tanks are laid on cradles or structural steelwork, most vertical tanks sit on their own foundations. Flat base found in a single location or on a tank farm and can be in a tank complex or single free standing. May be supported by a skirt. They contain a variety of products but nothing under pressure. They may be steam heated or electrically heated. Made of mild steel 5mm - 6mm thick welded/bolted however depending on product stored could be produced in stainless steel/aluminium. Although small and would not normally be rated under Class 4 due to the provisions of (d) they are rateable under Class 1 or 2, irrespective of size and the accessories regarding storage of fuel for power plant or liquids for the service sections. Storage ranges 1,000-30,000 gallons. For large class 4 storage tanks see: 215A-- & 215W-- Refinery, Chemical Works and Tank Farms.

Referencing details: Diameter and height of tank together with weight in tonnes of tank (or plate thick ness to enable weight to be calculated).

Cost information notes: -

Rateable element: Class 1 and Class 2 Accessories (1) and (2)(v) Class 2(f) Class 4 Table 4

Non-rateable element: If Class 2 proviso applies Whole if under Class 4 and Class 4(d) limitation applies i.e. does not exceed 400m3 and is readily capable of being moved without substantial demolition to surrounding structures.

Adjusted plant and machinery: Foundations, settings, platforms, staging for plant and machinery.

Number of items adjusted: The item can typically be found on an industrial, commercial or office complex. Some hereditaments may have multiple items, in which case the ERC needs to reflect the number of items.

Tech 1: % Addition

Tech 2: See cost information Notes

Unit size: -

Unit of measurement: m3

ERC: £0

Superseded codes: -

Location factor: Location Adjustment Applicable (See Guidance Notes) - ERC = UK mean of 1.00

Description: Most bulk storage tanks are built with a cone up (sometimes cone down - with a central sump) which allows any water or any dense materials to separate out and through a drain hole be tapped and disposed of. To create the cone in concrete would not allow for expansion of the steel tank and would cause a water barrier that would assist the chemical reaction to cause rust. It is assumed that the sub foundations are solid. This may be rock or naturally dense well-compacted subsoil however where this sub strata is poor load bearing piles and large re-enforced concrete foundations are required. For costing of these foundations the relevant section in the cost guide should be consulted or where details are poor and an estimate required see Category Tanks Item Foundations (21V01 etc) When rock or naturally well-compacted subsoil is found either a 100mm concrete layer or well-compacted chemically inert fill is employed. Onto this layer is added a drainage layer of some 150mm usually of stable permeable compacted granular construction (sand for example). This layer is sloped to give the cone up profile. This layer allows some minor movement, as the steel tank will move due to expansion when heated. Onto this layer is added a mixture of sand and bitumen (50mm thick). This is known as the bit sand layer. The base plates are rested on the bit sand layer and then welded together. The transfer of heat through the metal melts the bitumen and forms a watertight seal to the underside of the tank. At present BS 2654 sets out the requirements for such bases. Bit sand bases may consist of (i) Bit sand layer, Sand cone layer, Base layer or 100mm concrete (ii) Bit sand layer Sand cone layer (iii) Sand only It will be noted that (ii) and (iii) will be sitting on a large concrete sub foundation which will be costed separately.

Referencing details: -

Cost information notes: The 10% addition is to the basic ERC tank cost. Additions for different or single layers over a solid concrete foundation should be added at 6% and 2.5% respectively.

Rateable element: Class 4, Table 3 foundations and settings

Non-rateable element: -

Adjusted plant and machinery: Foundations, tank, walkways, stairways.

Superseded codes: -

Location factor: Location Adjustment Applicable (See Guidance Notes) - ERC = UK mean of 1.00

Description: To the underside of most Bulk Storage tanks is a Bit sand base (or sand base). This base will consist of (i) a compacted inert fill or oversight concrete (100mm) (ii) 150mm granular construction and (iii) a Bit sand layer. Below (I) is often a concrete slab and it is essential that details of this slab be referenced for valuation. Above ground foundations give an indication as to what is often buried below ground and if is often found that the size of the concrete foundations is in excess of what may be expected. In all circumstances the actual size from drawings should be sought however below is a simple method of estimating the size of the concrete raft if no other details are available. Take the weight of the tank and its contents. For every tonne of the steel structures adopt 2m3 of concrete.

Referencing details: 1000 litres of water = 1 tonne weight 1000 litres of water = 1 cubic metre.

Cost information notes: Where the size of the concrete raft is known and the cubic metres can be calculated the cost of the re inforced concrete raft should be costed as set out in 215V60 - 63.

Tech 1: Fixed head

Tech 2: 2,500m³

Unit size: -

Unit of measurement: m3

ERC: £204

Superseded codes: 215A10

Location factor: Considered Not Applicable at time of Publication

Description: Large Vertical Cylindrical tanks found on oil refineries, large chemical works and tank farms are generally all steel construction (usually mild steel) with butt-welded shells and tap welded bottoms and roofs – some have fixed roofs, often with an Internal Floating Roof (IFR). This IFR is deemed non-rateable. Others (particularly the largest examples) are fitted with External Floating Roofs (EFRs) – this requires a different design, as such tanks lack the structural stiffness provided where a fixed roof is specified. Consequently, the bodies of these tanks feature additional stiffening in the form of wind girders. In all cases, construction employs pre-formed tank sections laid out on-site and erected over a period of days. These tank sections have usually been treated (painted) with the tank manufacturer's rust-inhibiting coating. It is assumed that these tanks are located on-sites where crude oil, refined petrochemical products and/or aggressive materials are common. More modern tanks may have internal paint coats to prevent such aggressive oils and chemicals from attacking the mild steel plate protection from attack of this nature should be costed using the 215X series. All steel base plates on erected tanks are assumed to be painted with a primer to prevent initial rusting. Costs under 215A series assume the tank has been painted to refinery tank standards. The assumption is that the tanks on refineries and petrochemical works are subject to a 10-year maintenance cycle and the allowance scales for tanks reflects this type of regime. The tanks are assumed to be painted with a product that will last a maintenance period (average 10 years) and the costs reflect this type of paint specification. Foundations under the tanks base plate are bit-sand foundations (see 215J series). The bit-sand base usually sits on an oversite concrete base. Foundations should be costed separately. Where no details of foundations are available, 10% of the cost of the tank sitting on the foundations in question should be adopted as an additional line in the valuation.

Referencing details: 1. External diameter of tank. 2. External height of tank. 3. Material tank is of which the tank is constructed and method of construction (welded or bolted plates

). 4. Painting. 5. Any other known features - internally lined et cetera. 6. Fixed roof (with if without IFR) or External Floating Roof (EFR). 7. Age of construction and refurbishment date.

Cost information notes: These costs include external painting. Costs do not include for bitsand foundations, concrete and/or concrete - pile foundations, heating coils, insulation (rock wool), linings (butyl), structural stairways, catwalks, between tank walkways, etc. Further additions: - It is assumed that the outside of the tank is painted with a general long life paint and the internal tank is painted with a holding primer - for internal painting costs see 215X series.

Rateable element: Usually Class 4, Table 4 – however, tanks may be found in duties covered by both Class 2 (d) Draining ; (e) Supplying Water ; (f) Protection from hazards; List of Accessories 2 and Class 1 List of Accessories 1and 2.

Non-rateable element: If under Class 2, whole if Class 2 provisos applies - other than. If under Class 4 Heating coils, rock wool insulation, paddles. Whole if Class 4 (d)

Adjusted plant and machinery: Foundations, catwalks, bunds, piles, fire protection equipment, high-level walkways.

Number of items adjusted: The costs in this series reflect the assumption that more than one tank is included in the contract – i.e., these costs should not be discounted because the hereditament contains a large number of tanks.

Contract size adjustment: See Appendix BEAMS Note 1

Variations: -

Tanks

CG Code: 215V51

Specific: Foundations and Settings

Descriptive: Unknown concrete volume

Tech 1: x 2 tank weight (5 tonnes) = (10m³)

Tech 2: 5.0m³ - 25.0m³

Unit size: -

Unit of measurement: m3

ERC: £5,728

Superseded codes: -

Location factor: Location Adjustment Applicable (See Guidance Notes) - ERC = UK mean of 1.00

Description: To the underside of most Bulk Storage tanks is a Bit sand base (or sand base). This base will consist of (i) a compacted inert fill or oversight concrete (100mm) (ii) 150mm granular construction and (iii) a Bit sand layer. Below (I) is often a concrete slab and it is essential that details of this slab be referenced for valuation. Above ground foundations give an indication as to what is often buried below ground and if is often found that the size of the concrete foundations is in excess of what may be expected. In all circumstances the actual size from drawings should be sought however below is a simple method of estimating the size of the concrete raft if no other details are available. Take the weight of the tank and its contents. For every tonne of the steel structures adopt 2m3 of concrete.

Referencing details: 1000 litres of water = 1 tonne weight 1000 litres of water = 1 cubic metre.

Cost information notes: Where the size of the concrete raft is known and the cubic metres can be calculated the cost of the re inforced concrete raft should be costed as set out in 215V60 - 63.

Rateable element: Class 4 Table 3 Foundations, settings and supports.

Non-rateable element: -

Adjusted plant and machinery: Tanks

Descriptive: Saddle or cradle

Tech 1: 1m ht

Tech 2: 327mm engineering brickwork

Unit size: linear

Unit of measurement: m

ERC: £284

Superseded codes: -

Location factor: Location Adjustment Applicable (See Guidance Notes) - ERC = UK mean of 1.00

Description: Tanks - Supports bases and settings To the underside of most Bulk horizontal Storage tanks is a series of supporting structures or cradles constructed from the base foundation in brickwork , mass concrete or steel. They are provided so that the load of the tank can be adequately transferred to the base. Heights may vary but the costs are for 1.0m high(at highest point)

Referencing details: Check and record, thickness, material and height and length

Cost information notes: The cost for settings will reflect the curvatures of each cradle where necessary,. Measure to highest point of support and adopt this as the effective height x length.

Rateable element: Class 4 Table 3 Foundations, settings and supports.

Non-rateable element: -

Adjusted plant and machinery: Tanks

Number of items adjusted: -

Contract size adjustment: See Appendix BEAMS Note 2

Tanks

CG Code: 215W00

Specific: Large vertical

Descriptive: Refinery, Chemical Works and Tank Farms

Tech 1: Fixed head

Tech 2: 250m³

Unit size: -

Unit of measurement: m3

ERC: £524

Superseded codes: -

Location factor: Considered Not Applicable at time of Publication

Description: Large Vertical Cylindrical tanks found on oil refineries, large chemical works and tank farms are generally all steel construction (usually mild steel) with butt-welded shells and tap welded bottoms and roofs – some have fixed roofs, often with an Internal Floating Roof (IFR). This IFR is deemed non-rateable. Others (particularly the largest examples) are fitted with External Floating Roofs (EFRs) – this requires a different design, as such tanks lack the structural stiffness provided where a fixed roof is specified. Consequently, the bodies of these tanks feature additional stiffening in the form of wind girders. In all cases, construction employs pre-formed tank sections laid out on-site and erected over a period of days. These tank sections have usually been treated (painted) with the tank manufacturer's rust-inhibiting coating. It is assumed that these tanks are located on-sites where crude oil, refined petrochemical products and/or aggressive materials are common. More modern tanks may have internal paint coats to prevent such aggressive oils and chemicals from attacking the mild steel plate protection from attack of this nature should be costed using the 215X series. All steel base plates on erected tanks are assumed to be painted with a primer to prevent initial rusting. Costs under 215A series assume the tank has been painted to refinery tank standards. The assumption is that the tanks on refineries and petrochemical works are subject to a 10-year maintenance cycle and the allowance scales for tanks reflects this type of regime. The tanks are assumed to be painted with a product that will last a maintenance period (average 10 years) and the costs reflect this type of paint specification. Foundations under the tanks base plate are bit-sand foundations (see 215J series). The bit-sand base usually sits on an oversite concrete base. Foundations should be costed separately. Where no details of foundations are available, 10% of the cost of the tank sitting on the foundations in question should be adopted as an additional line in the valuation.

Referencing details: 1. External diameter of tank. 2. External height of tank. 3. Material tank is of which the tank is constructed and method of construction (welded or bolted plates

). 4. Painting. 5. Any other known features - internally lined et cetera. 6. Fixed roof (with if without IFR) or External Floating Roof (EFR). 7. Age of construction and refurbishment date.

Cost information notes: These costs include external painting. Costs do not include for bitsand foundations, concrete and/or concrete - pile foundations, heating coils, insulation (rock wool), linings (butyl), structural stairways, catwalks, between tank walkways, etc. Further additions: - It is assumed that the outside of the tank is painted with a general long life paint and the internal tank is painted with a holding primer - for internal painting costs see 215X series.

Rateable element: Usually Class 4, Table 4 – however, tanks may be found in duties covered by both Class 2 (d) Draining ; (e) Supplying Water ; (f) Protection from hazards; List of Accessories 2 and Class 1 List of Accessories 1and 2.

Non-rateable element: If under Class 2, whole if Class 2 provisos applies - other than. If under Class 4 Heating coils, rock wool insulation, paddles. Whole if Class 4 (d)

Adjusted plant and machinery: Foundations, catwalks, bunds, piles, fire protection equipment, high-level walkways.

Number of items adjusted: The costs in this series reflect the assumption that more than one tank is included in the contract – i.e., these costs should not be discounted because the hereditament contains a large number of tanks.

Contract size adjustment: See Appendix BEAMS Note 1

Tech 1: Fixed head

Tech 2: 2,000m³

Unit size: -

Unit of measurement: m3

ERC: £230

Superseded codes: -

Location factor: Considered Not Applicable at time of Publication

Description: Large Vertical Cylindrical tanks found on oil refineries, large chemical works and tank farms are generally all steel construction (usually mild steel) with butt-welded shells and tap welded bottoms and roofs – some have fixed roofs, often with an Internal Floating Roof (IFR). This IFR is deemed non-rateable. Others (particularly the largest examples) are fitted with External Floating Roofs (EFRs) – this requires a different design, as such tanks lack the structural stiffness provided where a fixed roof is specified. Consequently, the bodies of these tanks feature additional stiffening in the form of wind girders. In all cases, construction employs pre-formed tank sections laid out on-site and erected over a period of days. These tank sections have usually been treated (painted) with the tank manufacturer's rust-inhibiting coating. It is assumed that these tanks are located on-sites where crude oil, refined petrochemical products and/or aggressive materials are common. More modern tanks may have internal paint coats to prevent such aggressive oils and chemicals from attacking the mild steel plate protection from attack of this nature should be costed using the 215X series. All steel base plates on erected tanks are assumed to be painted with a primer to prevent initial rusting. Costs under 215A series assume the tank has been painted to refinery tank standards. The assumption is that the tanks on refineries and petrochemical works are subject to a 10-year maintenance cycle and the allowance scales for tanks reflects this type of regime. The tanks are assumed to be painted with a product that will last a maintenance period (average 10 years) and the costs reflect this type of paint specification. Foundations under the tanks base plate are bit-sand foundations (see 215J series). The bit-sand base usually sits on an oversite concrete base. Foundations should be costed separately. Where no details of foundations are available, 10% of the cost of the tank sitting on the foundations in question should be adopted as an additional line in the valuation.

Referencing details: 1. External diameter of tank. 2. External height of tank. 3. Material tank is of which the tank is constructed and method of construction (welded or bolted plates

). 4. Painting. 5. Any other known features - internally lined et cetera. 6. Fixed roof (with if without IFR) or External Floating Roof (EFR). 7. Age of construction and refurbishment date.

Cost information notes: These costs include external painting. Costs do not include for bitsand foundations, concrete and/or concrete - pile foundations, heating coils, insulation (rock wool), linings (butyl), structural stairways, catwalks, between tank walkways, etc. Further additions: - It is assumed that the outside of the tank is painted with a general long life paint and the internal tank is painted with a holding primer - for internal painting costs see 215X series.

Rateable element: Usually Class 4, Table 4 – however, tanks may be found in duties covered by both Class 2 (d) Draining ; (e) Supplying Water ; (f) Protection from hazards; List of Accessories 2 and Class 1 List of Accessories 1and 2.

Non-rateable element: If under Class 2, whole if Class 2 provisos applies - other than. If under Class 4 Heating coils, rock wool insulation, paddles. Whole if Class 4 (d)

Adjusted plant and machinery: Foundations, catwalks, bunds, piles, fire protection equipment, high-level walkways.

Number of items adjusted: The costs in this series reflect the assumption that more than one tank is included in the contract – i.e., these costs should not be discounted because the hereditament contains a large number of tanks.

Contract size adjustment: See Appendix BEAMS Note 1

Foundations under the tanks base plate are bit-sand foundations (see 215J series). The bit-sand base usually sits on an oversite concrete base. Foundations should be costed separately. Where no details of foundations are available, 10% of the cost of the tank sitting on the foundations in question should be adopted as an additional line in the valuation.

Referencing details: 1. External diameter of tank. 2. External height of tank. 3. Material tank is of which the tank is constructed and method of construction (welded or bolted plates

). 4. Painting. 5. Any other known features - internally lined et cetera. 6. Fixed roof (with if without IFR) or External Floating Roof (EFR). 7. Age of construction and refurbishment date.

Cost information notes: These costs include external painting. Costs do not include for bitsand foundations, concrete and/or concrete - pile foundations, heating coils, insulation (rock wool), linings (butyl), structural stairways, catwalks, between tank walkways, etc. Further additions: - It is assumed that the outside of the tank is painted with a general long life paint and the internal tank is painted with a holding primer - for internal painting costs see 215X series.

Rateable element: Usually Class 4, Table 4 – however, tanks may be found in duties covered by both Class 2 (d) Draining ; (e) Supplying Water ; (f) Protection from hazards; List of Accessories 2 and Class 1 List of Accessories 1and 2.

Non-rateable element: If under Class 2, whole if Class 2 provisos applies - other than. If under Class 4 Heating coils, rock wool insulation, paddles. Whole if Class 4 (d)

Adjusted plant and machinery: Foundations, catwalks, bunds, piles, fire protection equipment, high-level walkways.

Number of items adjusted: The costs in this series reflect the assumption that more than one tank is included in the contract – i.e., these costs should not be discounted because the hereditament contains a large number of tanks.

Contract size adjustment: See Appendix BEAMS Note 1

Tanks

CG Code: 215W21

Specific: Large vertical

Descriptive: Refinery, Chemical Works and Tank Farms

Tech 1: Fixed head

Tech 2: 11,000m³

Unit size: -

Unit of measurement: m3

ERC: £109

Superseded codes: 215A21

Location factor: Considered Not Applicable at time of Publication

Description: Large Vertical Cylindrical tanks found on oil refineries, large chemical works and tank farms are generally all steel construction (usually mild steel) with butt-welded shells and tap welded bottoms and roofs – some have fixed roofs, often with an Internal Floating Roof (IFR). This IFR is deemed non-rateable. Others (particularly the largest examples) are fitted with External Floating Roofs (EFRs) – this requires a different design, as such tanks lack the structural stiffness provided where a fixed roof is specified. Consequently, the bodies of these tanks feature additional stiffening in the form of wind girders. In all cases, construction employs pre-formed tank sections laid out on-site and erected over a period of days. These tank sections have usually been treated (painted) with the tank manufacturer's rust-inhibiting coating. It is assumed that these tanks are located on-sites where crude oil, refined petrochemical products and/or aggressive materials are common. More modern tanks may have internal paint coats to prevent such aggressive oils and chemicals from attacking the mild steel plate protection from attack of this nature should be costed using the 215X series. All steel base plates on erected tanks are assumed to be painted with a primer to prevent initial rusting. Costs under 215A series assume the tank has been painted to refinery tank standards. The assumption is that the tanks on refineries and petrochemical works are subject to a 10-year maintenance cycle and the allowance scales for tanks reflects this type of regime. The tanks are assumed to be painted with a product that will last a maintenance period (average 10 years) and the costs reflect this type of paint specification. Foundations under the tanks base plate are bit-sand foundations (see 215J series). The bit-sand base usually sits on an oversite concrete base. Foundations should be costed separately. Where no details of foundations are available, 10% of the cost of the tank sitting on the foundations in question should be adopted as an additional line in the valuation.

Superseded codes: 215A81

Location factor: Considered Not Applicable at time of Publication

Description: Large Vertical Cylindrical tanks found on oil refineries, large chemical works and tank farms are generally all steel construction (usually mild steel) with butt-welded shells and tap welded bottoms and roofs – some have fixed roofs, often with an Internal Floating Roof (IFR). This IFR is deemed non-rateable. Others (particularly the largest examples) are fitted with External Floating Roofs (EFRs) – this requires a different design, as such tanks lack the structural stiffness provided where a fixed roof is specified. Consequently, the bodies of these tanks feature additional stiffening in the form of wind girders. In all cases, construction employs pre-formed tank sections laid out on-site and erected over a period of days. These tank sections have usually been treated (painted) with the tank manufacturer's rust-inhibiting coating. It is assumed that these tanks are located on-sites where crude oil, refined petrochemical products and/or aggressive materials are common. More modern tanks may have internal paint coats to prevent such aggressive oils and chemicals from attacking the mild steel plate protection from attack of this nature should be costed using the 215X series. All steel base plates on erected tanks are assumed to be painted with a primer to prevent initial rusting. Costs under 215A series assume the tank has been painted to refinery tank standards. The assumption is that the tanks on refineries and petrochemical works are subject to a 10-year maintenance cycle and the allowance scales for tanks reflects this type of regime. The tanks are assumed to be painted with a product that will last a maintenance period (average 10 years) and the costs reflect this type of paint specification. Foundations under the tanks base plate are bit-sand foundations (see 215J series). The bit-sand base usually sits on an oversite concrete base. Foundations should be costed separately. Where no details of foundations are available, 10% of the cost of the tank sitting on the foundations in question should be adopted as an additional line in the valuation.

Referencing details: 1. External diameter of tank. 2. External height of tank. 3. Material tank is of which the tank is constructed and method of construction (welded or bolted plates

). 4. Painting. 5. Any other known features - internally lined et cetera. 6. Fixed roof (with if without IFR) or External Floating Roof (EFR). 7. Age of construction and refurbishment date.

Cost information notes: These costs include external painting. Costs do not include for bitsand foundations, concrete and/or concrete - pile foundations, heating coils, insulation (rock wool), linings (butyl), structural stairways, catwalks, between tank walkways, etc. Further additions: - It is assumed that the outside of the tank is painted with a general long life paint and the internal tank is painted with a holding primer - for internal painting costs see 215X series.

Rateable element: Usually Class 4, Table 4 – however, tanks may be found in duties covered by both Class 2 (d) Draining ; (e) Supplying Water ; (f) Protection from hazards; List of Accessories 2 and Class 1 List of Accessories 1and 2.

Non-rateable element: If under Class 2, whole if Class 2 provisos applies - other than. If under Class 4 Heating coils, rock wool insulation, paddles. Whole if Class 4 (d)

Adjusted plant and machinery: Foundations, catwalks, bunds, piles, fire protection equipment, high-level walkways.

Number of items adjusted: The costs in this series reflect the assumption that more than one tank is included in the contract – i.e., these costs should not be discounted because the hereditament contains a large number of tanks.

Contract size adjustment: See Appendix BEAMS Note 1

). 4. Painting. 5. Any other known features - internally lined et cetera. 6. Fixed roof (with if without IFR) or External Floating Roof (EFR). 7. Age of construction and refurbishment date.

Cost information notes: These costs include external painting. Costs do not include for bitsand foundations, concrete and/or concrete - pile foundations, heating coils, insulation (rock wool), linings (butyl), structural stairways, catwalks, between tank walkways, etc. Further additions: - It is assumed that the outside of the tank is painted with a general long life paint and the internal tank is painted with a holding primer - for internal painting costs see 215X series.

Rateable element: Usually Class 4, Table 4 – however, tanks may be found in duties covered by both Class 2 (d) Draining ; (e) Supplying Water ; (f) Protection from hazards; List of Accessories 2 and Class 1 List of Accessories 1and 2.

Non-rateable element: If under Class 2, whole if Class 2 provisos applies - other than. If under Class 4 Heating coils, rock wool insulation, paddles. Whole if Class 4 (d)

Adjusted plant and machinery: Foundations, catwalks, bunds, piles, fire protection equipment, high-level walkways.

Number of items adjusted: The costs in this series reflect the assumption that more than one tank is included in the contract – i.e., these costs should not be discounted because the hereditament contains a large number of tanks.

Contract size adjustment: See Appendix BEAMS Note 1

Tanks

CG Code: 215W58

Specific: Large vertical

Descriptive: Refinery, Chemical Works and Tank Farms

Tech 1: Floating head

Tech 2: 2,000m³

Unit size: -

Unit of measurement: m3

ERC: £287

Superseded codes: -

Location factor: Considered Not Applicable at time of Publication

Description: Large Vertical Cylindrical tanks found on oil refineries, large chemical works and tank farms are generally all steel construction (usually mild steel) with butt-welded shells and tap welded bottoms and roofs – some have fixed roofs, often with an Internal Floating Roof (IFR). This IFR is deemed non-rateable. Others (particularly the largest examples) are fitted with External Floating Roofs (EFRs) – this requires a different design, as such tanks lack the structural stiffness provided where a fixed roof is specified. Consequently, the bodies of these tanks feature additional stiffening in the form of wind girders. In all cases, construction employs pre-formed tank sections laid out on-site and erected over a period of days. These tank sections have usually been treated (painted) with the tank manufacturer's rust-inhibiting coating. It is assumed that these tanks are located on-sites where crude oil, refined petrochemical products and/or aggressive materials are common. More modern tanks may have internal paint coats to prevent such aggressive oils and chemicals from attacking the mild steel plate protection from attack of this nature should be costed using the 215X series. All steel base plates on erected tanks are assumed to be painted with a primer to prevent initial rusting. Costs under 215A series assume the tank has been painted to refinery tank standards. The assumption is that the tanks on refineries and petrochemical works are subject to a 10-year maintenance cycle and the allowance scales for tanks reflects this type of regime. The tanks are assumed to be painted with a product that will last a maintenance period (average 10 years) and the costs reflect this type of paint specification. Foundations under the tanks base plate are bit-sand foundations (see 215J series). The bit-sand base usually sits on an oversite concrete base. Foundations should be costed separately. Where no details of foundations are available, 10% of the cost of the tank sitting on the foundations in question should be adopted as an additional line in the valuation.

Referencing details: 1. External diameter of tank. 2. External height of tank. 3. Material tank is of which the tank is constructed and method of construction (welded or bolted plates

). 4. Painting. 5. Any other known features - internally lined et cetera. 6. Fixed roof (with if without IFR) or External Floating Roof (EFR). 7. Age of construction and refurbishment date.

Cost information notes: These costs include external painting. Others (particularly the largest examples) are fitted with External Floating Roofs (EFRs) – this requires a different design, as such tanks lack the structural stiffness provided where a fixed roof is specified. Consequently, the bodies of these tanks feature additional stiffening in the form of wind girders. In all cases, construction employs pre-formed tank sections laid out on-site and erected over a period of days. These tank sections have usually been treated (painted) with the tank manufacturer's rust-inhibiting coating. It is assumed that these tanks are located on-sites where crude oil, refined petrochemical products and/or aggressive materials are common. More modern tanks may have internal paint coats to prevent such aggressive oils and chemicals from attacking the mild steel plate protection from attack of this nature should be costed using the 215X series. All steel base plates on erected tanks are assumed to be painted with a primer to prevent initial rusting. Costs under 215A series assume the tank has been painted to refinery tank standards. The assumption is that the tanks on refineries and petrochemical works are subject to a 10-year maintenance cycle and the allowance scales for tanks reflects this type of regime. The tanks are assumed to be painted with a product that will last a maintenance period (average 10 years) and the costs reflect this type of paint specification. Foundations under the tanks base plate are bit-sand foundations (see 215J series). The bit-sand base usually sits on an oversite concrete base. Foundations should be costed separately. Where no details of foundations are available, 10% of the cost of the tank sitting on the foundations in question should be adopted as an additional line in the valuation.

Referencing details: 1. External diameter of tank. 2. External height of tank. 3. Material tank is of which the tank is constructed and method of construction (welded or bolted plates

). 4. Painting. 5. Any other known features - internally lined et cetera. 6. Fixed roof (with if without IFR) or External Floating Roof (EFR). 7. Age of construction and refurbishment date.

Cost information notes: These costs include external painting. Costs do not include for bitsand foundations, concrete and/or concrete - pile foundations, heating coils, insulation (rock wool), linings (butyl), structural stairways, catwalks, between tank walkways, etc. Further additions: - It is assumed that the outside of the tank is painted with a general long life paint and the internal tank is painted with a holding primer - for internal painting costs see 215X series.

Rateable element: Usually Class 4, Table 4 – however, tanks may be found in duties covered by both Class 2 (d) Draining ; (e) Supplying Water ; (f) Protection from hazards; List of Accessories 2 and Class 1 List of Accessories 1and 2.

Non-rateable element: If under Class 2, whole if Class 2 provisos applies - other than. If under Class 4 Heating coils, rock wool insulation, paddles. Whole if Class 4 (d)

Adjusted plant and machinery: Foundations, catwalks, bunds, piles, fire protection equipment, high-level walkways.

Number of items adjusted: The costs in this series reflect the assumption that more than one tank is included in the contract – i.e., these costs should not be discounted because the hereditament contains a large number of tanks.

Contract size adjustment: See Appendix BEAMS Note 1

Cost information notes: These costs include external painting. Costs do not include for bitsand foundations, concrete and/or concrete - pile foundations, heating coils, insulation (rock wool), linings (butyl), structural stairways, catwalks, between tank walkways, etc. Further additions: - It is assumed that the outside of the tank is painted with a general long life paint and the internal tank is painted with a holding primer - for internal painting costs see 215X series.

Rateable element: Usually Class 4, Table 4 – however, tanks may be found in duties covered by both Class 2 (d) Draining ; (e) Supplying Water ; (f) Protection from hazards; List of Accessories 2 and Class 1 List of Accessories 1and 2.

Non-rateable element: If under Class 2, whole if Class 2 provisos applies - other than. If under Class 4 Heating coils, rock wool insulation, paddles. Whole if Class 4 (d)

Adjusted plant and machinery: Foundations, catwalks, bunds, piles, fire protection equipment, high-level walkways.

Number of items adjusted: The costs in this series reflect the assumption that more than one tank is included in the contract – i.e., these costs should not be discounted because the hereditament contains a large number of tanks.

Contract size adjustment: See Appendix BEAMS Note 1

Tanks

CG Code: 215W75

Specific: Large vertical

Descriptive: Refinery, Chemical Works and Tank Farms

Tech 1: Floating head

Tech 2: 15,000m³

Unit size: -

Unit of measurement: m3

ERC: £123

Superseded codes: -

Location factor: Considered Not Applicable at time of Publication

Description: Large Vertical Cylindrical tanks found on oil refineries, large chemical works and tank farms are generally all steel construction (usually mild steel) with butt-welded shells and tap welded bottoms and roofs – some have fixed roofs, often with an Internal Floating Roof (IFR). This IFR is deemed non-rateable. Others (particularly the largest examples) are fitted with External Floating Roofs (EFRs) – this requires a different design, as such tanks lack the structural stiffness provided where a fixed roof is specified. Consequently, the bodies of these tanks feature additional stiffening in the form of wind girders. In all cases, construction employs pre-formed tank sections laid out on-site and erected over a period of days. These tank sections have usually been treated (painted) with the tank manufacturer's rust-inhibiting coating. It is assumed that these tanks are located on-sites where crude oil, refined petrochemical products and/or aggressive materials are common. More modern tanks may have internal paint coats to prevent such aggressive oils and chemicals from attacking the mild steel plate protection from attack of this nature should be costed using the 215X series. All steel base plates on erected tanks are assumed to be painted with a primer to prevent initial rusting. Costs under 215A series assume the tank has been painted to refinery tank standards. The assumption is that the tanks on refineries and petrochemical works are subject to a 10-year maintenance cycle and the allowance scales for tanks reflects this type of regime. The tanks are assumed to be painted with a product that will last a maintenance period (average 10 years) and the costs reflect this type of paint specification. Foundations under the tanks base plate are bit-sand foundations (see 215J series). The bit-sand base usually sits on an oversite concrete base. Foundations should be costed separately. Where no details of foundations are available, 10% of the cost of the tank sitting on the foundations in question should be adopted as an additional line in the valuation.

Referencing details: 1. External diameter of tank. 2. External height of tank. 3. Material tank is of which the tank is constructed and method of construction (welded or bolted plates

). 4. Painting. 5. Any other known features - internally lined et cetera. 6. Fixed roof (with if without IFR) or External Floating Roof (EFR). 7. Age of construction and refurbishment date.

Cost information notes: These costs include external painting. Costs do not include for bitsand foundations, concrete and/or concrete - pile foundations, heating coils, insulation (rock wool), linings (butyl), structural stairways, catwalks, between tank walkways, etc. Further additions: - It is assumed that the outside of the tank is painted with a general long life paint and the internal tank is painted with a holding primer - for internal painting costs see 215X series.

Tanks

CG Code: 215C101B

Specific: Horizontal Pressure Vessels

Descriptive: Refinery, Chemical Works and Tank Farms

Tech 1: Medium Pressure (14 - 20 bar)

Tech 2: 350m3

Unit size: -

Unit of measurement: Each

ERC: £136,217

Superseded codes: 215C42, 215C43, 215C44, 215C45, 215C46, 215C47, 215C50, 215C51, 215C52, 215C53, 215C54, 215C55, 215C56, 215C57, 215C80, 215C81, 215C82, 215C83, 215C84, 215C85, 215C86, 215C87

Location factor: Considered Not Applicable at time of Publication

Description: The tanks situated within Refineries and large Chemical Works are sometimes called BULLETS and are shaped like a cigar: tube shaped, having rounded ends. They are made from mild steel but can be stainless and some are lined depending upon the type of material held. Tubes can be made from other smaller tubes welded together on-site and tested for faults in weld. Pressures may be just above Atmosphere or up to 200 psig. The thickness of steel will generally be more than 25mm and consequently the tank is very heavy (even small ones) the supports and foundations will be large to hold this weight. The thickness of steel and the pressure testing increases the cost as does the on-site time for installation. They hold many substances including unstable crude oil, helium, oxygen and LPG in general. Propane and Butane stored in smaller tanks is often used for power or heat purposes and thus may be rateable under Class 1 or Class 2.

Referencing details: Industrial Usage Medium Pressure Horizontal cylindrical - saddle mounted 16 Bar Temp Range - 10C to + 50C

Cost information notes: -

Rateable element: Tanks - Class 4, Table 4 Class 1 List of Accessories (1) - storing of fuel for generation of power. Tanks Class 2(b) Heating list of accessories Tanks

Non-rateable element: Whole if under Class 4 the Class 4(d) limitation applies i.e. does not exceed 400m3 and readily capable of being moved without substantial demolition of any surrounding structure Whole under Class 2 "other than¬85"

Adjusted plant and machinery: Stairways, fire protection, staging, foundations.

Number of items adjusted: The item can typically be found on an industrial, commercial or office complex. Some hereditaments may have multiple items, in which case the ERC needs to reflect the number of items.

Contract size adjustment: See Appendix BEAMS Note 1

Tennis Centres

CG Code: 53U00B

Specific: Indoor

Descriptive: Steel Frame Profile Metal Sheet Cladding

Tech 1: Average Quality

Tech 2: Single Storey Purpose Built

Unit size: m2

Unit of measurement: m2

ERC: £1,055

Superseded codes: -

Location factor: Location Adjustment Applicable (See Guidance Notes) - ERC = UK mean of 1.00

Description: Indoor Tennis block based on the MODERN DAY EQUIVALENT. SINGLE STOREY - Construction specification includes Reinforced Concrete beam foundations with some retaining walls, steel frame, specialist sub-base, metal cladding (incl roof lights), elements of curtain walling (rain screen cladding) albeit other doors are metal louvered PCC. Internally the walls will be plastered with the exception of the courts which are painted black. Floor finishes include carpet vinyl with an acrylic surface in places. Ceilings are a mixture of plasterboard MF suspended ceilings to non court areas. Cubicles will be provided as part of the FFE. Services include sanitary ware, gas LTHW central heating, cooling ventilation, electrics, alarms, CCTV, data cables building maintenance system. An allowance for roller Shutters has also been included. This specification is reflective of the community use facilities being constructed by Local Authorities and private clubs open to the public. Specification differences are not uncommon thus a figure 10% either way should be anticipated. However, due to the high level of M&E installed, in this beacon, where the facility is constructed at a small club level where BMS, cooling data cabling has not been installed,, specification differences of 10-15% should be expected. Please note : Whilst the tennis hall part of the building will be a single storey building, it will be a double height - circa 6.0m.

Referencing details: -

Cost information notes: All costs exclude External Works.

Rateable element: -

Non-rateable element: -

Tennis Centres

CG Code: 53U00G

Specific: Indoor

Descriptive: Steel Frame Profile Metal Sheet Cladding

Tech 1: Average Quality - 6 Courts

Tech 2: Two storey purpose built (second floor provision for Fitness suite or viewing gallery).

Unit size: m2

Unit of measurement: m2

ERC: £1,081

Superseded codes: -

Location factor: Location Adjustment Applicable (See Guidance Notes) - ERC = UK mean of 1.00

Description: Indoor Tennis block based on the MODERN DAY EQUIVALENT. TWO STOREY (In part) - Construction specification include RC beam foundations with some retaining walls, steel frame specialist sub-base, metal cladding (incl roof lights), elements of curtain walling (rain screen cladding) albeit other doors are metal louvered PCC. Precast upper floors (incl screed). Internally the walls will be plastered with the exception of the courts which are painted black. Floor finishes include carpet vinyl with an acrylic surface in places. Ceilings are a mixture of plasterboard MF suspended ceilings to non court areas. Cubicles will be provided as part of the FFE. Services include sanitary ware, gas LTHW central heating, cooling ventilation, electrics, alarms, CCTV, data cables building maintenance system. A Lift has been included. The rate includes an allowance for roller Shutters. This specification is reflective of the community use facilities being constructed by local authorities private clubs open to the public. Specification differences are not uncommon thus a figure 10% either way should be anticipated. However, due to the high level of M&E installed, in this beacon, where the facility is constructed at a small club level where BMS, cooling data cabling has not been installed,, specification differences of 10-15% should be expected. Due to the specification and similarity in terms of construction e.g. flooring and glazed screen provision etc., the rate stated would permit either a second floor viewing gallery or a cat A fit out of a fitness suite. No loose FFE or fitness equipment would be included in the rate. Please note : Whilst the tennis centre is 2 storey, the actual tennis hall is likely to be a single storey of double height i.e. circa 6m tall.

Referencing details: -

Cost information notes: All costs exclude External Works.

Tech 1: 1 court

Tech 2: 36.58m x 18.29m (669m2).

Unit size: Each

Unit of measurement: Each

ERC: £30,883

Superseded codes: -

Location factor: Location Adjustment Applicable (See Guidance Notes) - ERC = UK mean of 1.00

Description: This code relates to the foundation beam ONLY - the air hall / playing surface is subject to a separate cost guide code. The foundation is a continuous ring beam, approx. size 650mm x 650mm (Although ground conditions can alter dimensions to 500mm - 750mm), Grade C35 concrete. The surface should have towelled finish to facilitate the air seal with the inner membrane flap. The beam will have a slight outward fall to prevent rainwater running into the dome. The anchor fittings are drilled once the concrete has set. There will be a concrete pad circa 1750mm x 1750mm x 150mm across the beam in the location of the revolving door. This cost is included. The cost includes, excavation, disposal, 50mm blinding concrete, 650mm x 650mm concrete foundation (including 2 layers of mesh) and an appropriate surface finish. 50mm of surface gravel to hide the anchors has also been included. The cost includes no other external works.

Referencing details: -

Cost information notes: The above rate relates to a concrete ring beam foundation solution. Ground anchors may be used as an alternative to secure the dome. An indicative cost for a 1 court double skin dome using ground anchors would attract a premium in the region of 9%.

Descriptive: Single skin - air supported, PVC woven fabric air hall

Tech 1: 1 court

Tech 2: 36.58m x 18.29m (669m2). Height allowed - 7m.

Unit size: Each

Unit of measurement: Each

ERC: £84,042

Superseded codes: -

Location factor: Location Adjustment Applicable (See Guidance Notes) - ERC = UK mean of 1.00

Description: The dome consists of a pre-tailored polythene membrane, which is anchored around a perimeter concrete foundation. The membrane is secured by a network of plastic-coated wired ropes which is also connected to the foundation. The rope network relieves the membrane of most of the stresses and strains when the structure is inflated. If ground conditions permit, a series of ground anchors can be used in lieu of the foundation, although this method is slightly more expensive than the ring beam. The dome is inflated by two 300mm diameter centrifugal fans with 240V single phase motors. These are mounted in fibreglass cabinets. One fan is adequate to support the facility in normal operating conditions, although a second fan is required in high winds. As the dome is a single membrane with no insulation, it is not cost effective to heat, although space heaters may be used during winter to melt the snow. (The cost of this is excluded). Due to the transparent membrane, lights are not provided during daylight hours. Standard outdoor floodlighting (Excluded but separate code exists) provides adequate penetration for night play. Internal lights are not recommended due to the significant damage caused by unexpected deflation. Cost includes supply installation of the membrane, steel cable network. One revolving door, 2 fans with control panel anemeter and anchor fixings. A backup generator has been included. The foundation (included) is a continuous ring beam, approx. size 650mm x 650mm (Although ground conditions can alter dimensions to 500mm - 750mm), Grade C35 concrete. The surface should have trowelled finish to facilitate the air seal with the inner membrane flap. The beam will have a slight outward fall to prevent rainwater running into the dome. The anchor fittings are drilled once the concrete has set. There will be a concrete pad circa 1750mm x 1750mm x 150mm across the beam in the location of the revolving door. This cost is included. Regarding the foundation, the rate includes, excavation, disposal, 50mm blinding concrete, the 650mm x 650mm concrete foundation (including 2 layers of mesh) and an appropriate surface finish. 50mm of surface gravel to hide the anchors has also been included. The rate includes no other external works. Electrical installation /

upgrade, storage, playing surfaces, external works, drainage and fuel for the generator are EXCLUDED.

Referencing details: -

Cost information notes: Cost includes both the dome and a ring beam foundation

Rateable element: -

Non-rateable element: -

Adjusted plant and machinery: -

Number of items adjusted: -

Contract size adjustment: See Appendix BEAMS Note 2

Variations: Entry to the dome is via a self supporting steel revolving door which minimises air escape. A separate 2m x 1m steel door can be added to assist with disabled access at an addition of code 53U15V1

Description: The dome consists of a pre-tailored polythene membrane, which is anchored around a perimeter concrete foundation (not included in the rate). The membrane is secured by a network of plastic-coated wired ropes which is also connected to the foundation. The rope network relieves the membrane of most of the stresses and strains when the structure is inflated. If ground conditions permit, a series of ground anchors can be used in lieu of the foundation, although this method is slightly more expensive than the ring beam. The dome is inflated by two 300mm diameter centrifugal fans with 240V single phase motors. These are mounted in fibreglass cabinets. One fan is adequate to support the facility in normal operating conditions, although a second fan is required in high winds. As the dome is a single membrane with no insulation, it is not cost effective to heat, although space heaters may be used during winter to melt the snow. (The cost of this is excluded). Due to the transparent membrane, lights are not provided during daylight hours. Standard outdoor floodlighting (Excluded but separate code exists) provides adequate penetration for night play. Internal lights are not recommended due to the significant damage caused by unexpected deflation. Cost includes supply installation of the membrane, steel cable network. One revolving door, 2 fans with control panel anemeter and anchor fixings. A 12 backup generator has been included. Foundation, electrical installation / upgrade, storage, playing surfaces, external works, drainage and fuel for the generator are EXCLUDED.

Referencing details: -

Cost information notes: The cost to provide a concrete ring beam support is noted in a separate code.

Description: A cable dome is a permanent or temporary structure consisting of a PVC membrane, strengthened by steel cables and inflated by a continuous running fan. It is held up by negative air pressure within. In the case of a cable dome, a membrane with a net of steel cables for strength is placed over the area to be covered and then inflated by a fan that must remain running. There are no supporting structures. Entry to the dome is via a revolving door or a set of double airlock doors. Domes can be linked together to provide a specific court layout. Main membrane - polyester fabric coated with PVS on both sides. It can be green up to a height of 3-4m for good ball visibility with a translucent white fabric on the roof area to let in natural light. Thermal insulation: A 10mm thick translucent layer of polyurethane insulation is placed on top of the main membrane to provide an efficient thermal barrier to keep in heat and conserve energy. Protective Foil: Polyurethane foil is placed on top of the insulation layer to provide protection for the main membrane against the steel cables, pollution and dirt. Steel galvanised nets: A net of galvanised steel rope is lain in the sandwich of membranes providing a strong cover that mounds the shape of the inflated membranes takes up most of the stress. The foundation is a continuous ring beam, approx. size 650mm x 650mm (although ground conditions can alter dimensions to 500mm - 750mm), Grade C35 concrete. The surface should have towelled finish to facilitate the air seal with the inner membrane flap. The beam will have a slight outward fall to prevent rainwater running into the dome. Description: This is a modern day equivalent and reflects a sustainable specification which is currently being constructed in most modern day facilities. Construction: Excavation (topsoil / sub-base), with disposal off site. Geotextile membrane with 150mm Type 1 stone. Final surface (laid by hand); 65mm porous macadam (40mm depth with 20mm nominal aggregate / 25mm depth with 6mm aggregate). Precast concrete edging. Rate includes 2.75mm weld mesh fencing - 2.75m high including posts set into concrete (1 single gate). Perimeter soak away drainage with a catch pit solid pipe to outfall (allowance of 20m).

Referencing details: Number of Courts

Cost information notes: The cost does not include any allowance of drainage attenuation and it is assumed a permanent drainage connection will be within 20m of the edge of the site. It is assumed a relatively level site has been used, thus extensive cut fill will not be included within the figure.

Rateable element: -

Non-rateable element: -

Adjusted plant and machinery: -

Number of items adjusted: -

Contract size adjustment: See Appendix BEAMS Note 2

Variations: If constructed to Sport England standard for Tennis Courts (as opposed to SEPCA), it is noted they require 300mm Type 3 sub-base. The different sub-base specification increases the cost using code 53U30V2. Type 3 is a free draining material required under hard surfaces and complies with SUDS requirements.

Unit size: -

Unit of measurement: m2

ERC: £1,013

Superseded codes: -

Location factor: Location Adjustment Applicable (See Guidance Notes) - ERC = UK mean of 1.00

Description: The scale of the facility and support accommodation will depend upon the size of the sports hall and the extent of other activities to be included as part of the facility. For instance sports halls may be combined with swimming pools, ice rinks, etc. as part of a larger sports and leisure facility. Each project will have its own requirements, but every freestanding sports hall should have: Foyer and reception, Refreshment area, Changing and toilet accommodation, Facilities for disabled people, Office accommodation, Integral equipment storage, Hall viewing with seating, Provision for first aid, Plant room, Cleaners store. Facility will include hot air blown heating for thermal comfort and good lighting provisions.

Referencing details: Cost to be applied to the tennis hall GIFA not the tennis centre area

Cost information notes: Cost applies to tennis hall function as opposed to a composite tennis centre - See Tennis Centres.

Tech 1: -

Tech 2: -

Unit size: -

Unit of measurement: m2

ERC: £554

Superseded codes: -

Location factor: Location Adjustment Applicable (See Guidance Notes) - ERC = UK mean of 1.00

Description: Reinforced concrete bases to transformers with remainder of area in loose fill media. Surround to compound in steel un-climbable fencing built off concrete perimeter ground beam. Transformers within brick or concrete structures may have walls only or may have a roof over. Can often be found alongside sub-stations.

Referencing details: Measure external dimensions of fencing or walls. Note number of transformers. Do not enter compound.

Cost information notes: Excludes transformers Includes foundations, gravel or concrete base, fencing or walls to 1.8m height, gates and all within the compound area.

Uninterruptible power supply

CG Code: 200B01

Specific: Rotary

Descriptive: Maintains full system power.

Tech 1: 415V

Tech 2: UPS output kw [E] 120

Unit size: -

Unit of measurement: Each

ERC: £102,485

Superseded codes: -

Location factor: Considered Not Applicable at time of Publication

Description: A rotary flywheel Uninterruptible Power Supply (UPS) uses a constantly spinning flywheel powered from the mains to store sufficient (kinetic) energy to instantly generate electrical power if the main supply fails, for a short period whilst a conventional diesel generator runs up to speed.

Referencing details: Key identifying factors: Static or Rotary UPS Power Rating (in kW or kVA) Battery Run/autonomy time. Battery in matching cubicles or on racks

Cost information notes: Cost includes the diesel generator assumed to be 414 volt / 50HZ

Rateable element: -

Non-rateable element: -

Adjusted plant and machinery: -

Number of items adjusted: The item can typically be found on an industrial, commercial or office complex. Some hereditaments may have multiple items, in which case the ERC needs to reflect the number of items.

Location factor: Considered Not Applicable at time of Publication

Description: Rotary Flywheel Power - Alternating Current (AC) comes in and passes through a Rectifier and is converted to Direct Current (DC). The DC current charges up batteries. The current then runs a rotary flywheel, which is a heavy spinning wheel. The wheel turns a shaft, which then turns an alternator producing AC current. After the alternator there is often a thyristor to regulate the current. Before the batteries is a diesel generator (often a DC generator). The batteries are in batches of 128 and are usually 2 volts. (The life of a battery if well-maintained will be 8 years) The running time is approximately 10 minutes. When the mains fail the mains fail device starts the diesel alternator. In the interim the block of batteries maintain the current and the rotary flywheel continues turning and generating. The millisecond before the batteries come in the flywheel is free running but due to its weight it keeps turning and generating and thus there is no loss of power to the main system. After 1 minute the diesel engine will be at full capacity and will take over from the batteries in supplying the flywheel with power. It will also re-charge the batteries. The diesel generator will run for approximately 48 hours giving enough time for the mains supply to be restored.

Referencing details: Key identifying factors: Static or Rotary UPS Power Rating (in kW or kVA) Battery Run/autonomy time Battery in matching cubicles or on racks

Cost information notes: Cost does not include battery banks, rectifier, inverter or thyristor but does include the diesel generator. It is assumed that the voltage is 415 V (ss stated differently) at 50 hz

Unit of measurement: m

ERC: £517

Superseded codes: -

Location factor: Location Adjustment Applicable (See Guidance Notes) - ERC = UK mean of 1.00

Description: Dry stone wall, tapered from base top. Constructed of stone typical to the locality. Stone work to be coursed to suit local requirements.

Referencing details: Measure height and length Note if strip foundation is used and record.

Cost information notes: Cost based on 1.2m high wall

Rateable element: -

Non-rateable element: -

Adjusted plant and machinery: -

Number of items adjusted: -

Contract size adjustment: See Appendix BEAMS Note 2

Variations: -

CG Code: 30P0BZ

Specific: Class A Engineering

Descriptive: One & half Brick solid

Tech 1: 330mm thick

Tech 2: -

Unit size: -

Unit of measurement: m2

ERC: £308

Superseded codes: -

Location factor: Location Adjustment Applicable (See Guidance Notes) - ERC = UK mean of 1.00

Description: Class A engineering brick one & half brick solid wall, 330mm thick

Referencing details: Wall area m2

Cost information notes: -

Rateable element: -

Non-rateable element: -

Adjusted plant and machinery: -

Number of items adjusted: -

Contract size adjustment: See Appendix BEAMS Note 2

Variations: -

Walls - External

CG Code: 30P0C1

Specific: Cavity Wall

Descriptive: Rigid PIR insulation board (Urethane is floor insulation)

Tech 1: 50mm thick

Tech 2: Includes retaining discs

Unit size: -

Unit of measurement: m2

ERC: £19

Superseded codes: -

Location factor: Location Adjustment Applicable (See Guidance Notes) - ERC = UK mean of 1.00

Description: Rigid PIR insulation board 50mm, including retaining discs and cutting around ties.

Referencing details: Wall area m2

Cost information notes: -

Rateable element: -

Non-rateable element: -

Adjusted plant and machinery: -

Number of items adjusted: -

Contract size adjustment: See Appendix BEAMS Note 2

Variations: -

Walls - External

CG Code: 30P0C2

Specific: Cavity Wall

Descriptive: Rigid PIR insulation board (Urethane is floor insulation)

Tech 1: 75mm thick

Tech 2: Includes retaining discs

Unit size: -

Unit of measurement: m2

ERC: £25

Superseded codes: -

Location factor: Location Adjustment Applicable (See Guidance Notes) - ERC = UK mean of 1.00

Description: Rigid PIR insulation board 75mm, including retaining discs and cutting around ties.

Referencing details: Wall area m2

Cost information notes: -

Rateable element: -

Non-rateable element: -

Adjusted plant and machinery: -

Number of items adjusted: -

Contract size adjustment: See Appendix BEAMS Note 2

Variations: -

Walls - External

CG Code: 30P0C3

Specific: Cavity Wall

Descriptive: Injected wall-insulation

Tech 1: -

Tech 2: -

Unit size: -

Unit of measurement: m2

ERC: £7

Superseded codes: -

Location factor: Location Adjustment Applicable (See Guidance Notes) - ERC = UK mean of 1.00

Description: Injected wall-insulation

Referencing details: Wall area m2

Cost information notes: Injected materials have increased over the years due to the increase in U values and has become more expensive

Rateable element: -

Non-rateable element: -

Adjusted plant and machinery: -

Number of items adjusted: -

Contract size adjustment: See Appendix BEAMS Note 2

Variations: -

Walls - External

CG Code: 30P0C4

Specific: Cavity Wall

Descriptive: Forming Cavities, in hollow walls

Tech 1: -

Tech 2: -

Unit size: -

Unit of measurement: m2

ERC: £2

Superseded codes: -

Location factor: Location Adjustment Applicable (See Guidance Notes) - ERC = UK mean of 1.00

Description: Forming cavity within cavity wall

Referencing details: Wall area m2

Cost information notes: -

Rateable element: -

Non-rateable element: -

Adjusted plant and machinery: -

Number of items adjusted: -

Contract size adjustment: See Appendix BEAMS Note 2

Variations: -

Walls - External

CG Code: 30P0C5

Specific: Cavity Wall

Descriptive: Common brick - both skins

Tech 1: Includes stainless steel wall ties, excluding insulation

Tech 2: -

Unit size: -

Unit of measurement: m2

ERC: £108

Superseded codes: -

Location factor: Location Adjustment Applicable (See Guidance Notes) - ERC = UK mean of 1.00

Description: Build cavity wall-in commons with stainless steel wall ties in cavity

Referencing details: Wall area m2

Cost information notes: -

Rateable element: -

Non-rateable element: -

Adjusted plant and machinery: -

Number of items adjusted: -

Contract size adjustment: See Appendix BEAMS Note 2

Variations: -

Walls - External

CG Code: 30P0CA

Specific: Cavity Wall

Descriptive: Common brick one side, facing on other

Tech 1: Includes stainless steel wall ties, excluding insulation

Tech 2: -

Unit size: -

Unit of measurement: m2

ERC: £122

Superseded codes: -

Location factor: Location Adjustment Applicable (See Guidance Notes) - ERC = UK mean of 1.00

Description: Build cavity wall-in facing brick to outer skin & commons internally with stainless steel wall ties in cavity

Referencing details: Wall area m2

Cost information notes: -

Rateable element: -

Non-rateable element: -

Adjusted plant and machinery: -

Number of items adjusted: -

Contract size adjustment: See Appendix BEAMS Note 2

Variations: -

Walls - External

CG Code: 30P0CF

Specific: Cavity Wall

Descriptive: Blockwork one side, facing brick to outer

Tech 1: Includes stainless steel wall ties, excluding insulation

Tech 2: -

Unit size: -

Unit of measurement: m2

ERC: £105

Superseded codes: -

Location factor: Location Adjustment Applicable (See Guidance Notes) - ERC = UK mean of 1.00

Description: Build cavity wall-in brick facing to outer & block inner with stainless steel wall ties in cavity

Referencing details: Wall area m2

Cost information notes: -

Rateable element: -

Non-rateable element: -

Adjusted plant and machinery: -

Number of items adjusted: -

Contract size adjustment: See Appendix BEAMS Note 2

Walls - External

CG Code: 30P0CK

Specific: Sundry Items

Descriptive: Cavity Wall-insulation

Tech 1: 50mm Thick

Tech 2: Fixed with retaining clips

Unit size: -

Unit of measurement: m2

ERC: £21

Superseded codes: -

Location factor: Location Adjustment Applicable (See Guidance Notes) - ERC = UK mean of 1.00

Description: Rigid urethane insulation board 50mm, including retaining discs and cutting around ties.

Referencing details: -

Cost information notes: -

Rateable element: -

Non-rateable element: -

Adjusted plant and machinery: -

Number of items adjusted: -

Contract size adjustment: See Appendix BEAMS Note 2

Variations: -

Walls - External

CG Code: 30P0CP

Specific: Sundry Items

Descriptive: Brickwork (Extra over)

Tech 1: Fair faced & pointing one side

Tech 2: Additional costs

Unit size: -

Unit of measurement: m2

ERC: £3

Superseded codes: -

Location factor: Location Adjustment Applicable (See Guidance Notes) - ERC = UK mean of 1.00

Description: Extra over brickwork walls for fair face and pointing one side.

Referencing details: -

Cost information notes: Note Pointing is usually included in the rate for brickwork

Rateable element: -

Non-rateable element: -

Adjusted plant and machinery: -

Number of items adjusted: -

Contract size adjustment: See Appendix BEAMS Note 2

Variations: -

Walls - External

CG Code: 30P0CU

Specific: Metal Stud Gyproc Faced

Descriptive: 2 Hour Fire Protection

Tech 1: 100mm Thick

Tech 2: -

Unit size: -

Unit of measurement: m2

ERC: £68

Superseded codes: -

Location factor: Location Adjustment Applicable (See Guidance Notes) - ERC = UK mean of 1.00

Description: Two hour partition, gyproc metal stud comprising two layers of 12.5mm fire line board both sides, painting.

Referencing details: Based on Wall area = m2

Cost information notes: Includes skirting boards but excludes doors, glazed areas and windows.

Rateable element: -

Non-rateable element: -

Adjusted plant and machinery: -

Number of items adjusted: -

Contract size adjustment: See Appendix BEAMS Note 2

Variations: -

Walls - Internal

CG Code: 30Z02A

Specific: WC Cubicles

Descriptive: Melamine faced

Tech 1: Standard Economical Grade

Tech 2: -

Unit size: -

Unit of measurement: Each

ERC: £579

Superseded codes: -

Location factor: Location Adjustment Applicable (See Guidance Notes) - ERC = UK mean of 1.00

Description: WC Cubicles melamine faced cubicles - Standard/economical grade.

Referencing details: Count & record - note Quality

Cost information notes: Excludes sanitary fittings, toilet roll holders. Cost code is for standard grade.

Rateable element: -

Non-rateable element: -

Adjusted plant and machinery: -

Number of items adjusted: -

Contract size adjustment: See Appendix BEAMS Note 2

Waste Storage Bunker

CG Code: 42W01B

Specific: RF Concrete bunker below ground

Descriptive: Bunker structure only

Tech 1: Over 1,000m3 Volume

Tech 2: -

Unit size: -

Unit of measurement: m3

ERC: £227

Superseded codes: -

Location factor: Location Adjustment Applicable (See Guidance Notes) - ERC = UK mean of 1.00

Description: Commonly found in the reception halls of Energy from Waste Plants. Purpose of the bunker is to provide waste storage capacity below ground and below the tipping floor. The bunker is constructed in a single pour, walls 0.5m thick. Housed within main structure of the waste facility to minimise the escape of odours. Overhead grab cranes used to mix and break up the incoming waste, to ensure homogeneity of feed to the combustion chambers. Volume of the bunker is >1000m3

Referencing details: Internal Volume

Cost information notes: Bunker construction only included

Rateable element: -

Non-rateable element: -

Adjusted plant and machinery: -

Number of items adjusted: -

Contract size adjustment: See Appendix BEAMS Note 2

Variations: -

Waste Storage Bunker

Weighbridges

CG Code: 3000Q1

Specific: Electric Load Cells

Descriptive: Concrete Base

Tech 1: With raised ends or shallow pit

Tech 2: -

Unit size: -

Unit of measurement: m2

ERC: £10,327

Superseded codes: -

Location factor: Considered Not Applicable at time of Publication

Description: Cost is for housing or settings. Electric weighbridges and weigh beams operate by load cells resting on over site concrete. Weighbridges are generally 3 metres wide and 12 to 15 metres long: a 450mm depth is required below the weighbridge to house the load cells. This may be achieved by a shallow pit or, more usually, by the use of access ramps and a flat concrete approach at each end to a raised plate level. Weighing capacity is usually 20,30,40 or 50 tonnes.

Referencing details: Overall size of pit or individual cell support blocks Weighbridge plates are generally 3 m wide and between 12 - 15 m long. These are not rateable it is the supports, settings and founds to them that are Class 4.

Cost information notes: -

Rateable element: Supports, settings and founds together with access ramps

Non-rateable element: Weighbridge plates

Adjusted plant and machinery: Ramped access - concrete , steel or tarmac. Control cabins or kiosks

Number of items adjusted: -

Contract size adjustment: See Appendix BEAMS Note 2

Variations: -

Weighbridges

CG Code: 3000Q2

Specific: Weigh Beams

Descriptive: Pit for Each individual beam

Tech 1: With concrete or tarmac between individual pits

Tech 2: -

Unit size: -

Unit of measurement: Each

ERC: £654

Superseded codes: -

Location factor: Considered Not Applicable at time of Publication

Description: Weigh beams are generally 3 metres wide and 750mm long; a 275mm deep box is set in the concrete or tarmac paving to house the beams. Cost is for housing or settings. Instead of having a large plate a series of Weigh beams are normally installed,. A 275mm deep box is set in the concrete or tarmac paving to house the beams & over a length of 15 m there may be 4 or 5 beams. Within each pit is set the electrical cells on which a steel plate sits. The cost of a single box / pit is given but additions are required for the concrete / tarmac area between them , which is often re-enforced.

Referencing details: Overall size of pit or individual cell support blocks

Cost information notes: For cost of concrete between pits see Item Code 300065

Rateable element: Supports, settings and founds together with access ramps

Non-rateable element: Weighbridge plates

Adjusted plant and machinery: Ramped access - concrete , steel or tarmac. Control cabins or kiosks

Number of items adjusted: -

Contract size adjustment: See Appendix BEAMS Note 2

Variations: -

Weighbridges

CG Code: 3000Q5

Specific: Mechanical within pit

Descriptive: Road

Tech 1: 400mm Depth

Tech 2: 20 Tonnes

Unit size: -

Unit of measurement: Each

ERC: £6,304

Superseded codes: -

Location factor: Considered Not Applicable at time of Publication

Description: Cost is for the pit that houses the mechanical weighing equipment on which a metal plate, flush with the road surface, sits. Weighbridges are generally 3 metres wide and 12 to 15 metres long: a 450mm depth is required below the weighbridge to house the mechanical load cells. Weighing capacity is usually up to 20 tonnes

Referencing details: Overall size of pit

Cost information notes: Care must be exercised to ensure that the mechanical pit costs do not exceed those for the equivalent load cell setup.

Rateable element: Supports, settings and founds

Non-rateable element: Weighbridge plates

Adjusted plant and machinery: Control cabins or kiosks

Number of items adjusted: -

Contract size adjustment: See Appendix BEAMS Note 2

Variations: -

Weighbridges

CG Code: 3000Q6

Specific: Mechanical within pit

Appendix

BEAMS Note 1

(BEAMS Note 1) The ERC for this item should be added to the total of the ERC of the other P&M items on the site and the Buildings ERC (where applicable) to enable the correct contract size adjustment to be made. ERC of P&M Items + ERC of Building Component's = Total ERC (net figure rateable items only) to which contract size adjustment should be applied The Generic Contractors Spreadsheet has this facility built into the programme - it is recommended you undertake all contractors test valuations using this spreadsheet. (Details on the application of contract size adjustments can be found in the RCG Guidance notes). Where RV is calculated using the comparative method (rental method) the contract size adjustment should be made as follows: Select - SCAT code box "P and M as an addition" within the Generic Contractors Test Spreadsheet facility. Or Where the spreadsheet is not used take the: Reciprocal of statutory de-capitalisation rate (for example 5% reciprocal = 20) multiply by rateable value of the buildings (before any overall end allowances are made and after making a notional deduction for the land value) and add to the ERC of P&M. Use resultant figure to calculate contract size adjustment. (Guidance Notes - Section 6)

BEAMS Note 2

(BEAMS Note 2) The ERC for this item should be added to all other rateable items on the hereditament (except land). Therefore the total of the ERC of the other Building Items and the P&M ERC (where applicable) to enable the correct contract size adjustment to be made. ERC of Building Component + ERC of P&M = Total ERC to which contract size adjustment should be applied. The appropriate % adjustment should be made in accordance with the scale for contract size adjustment specified under section 6 of the RCG Guidance notes. The currency ERC rates are set at £4m (Four Million Pounds) @ 1st April (AVD) for the RCG Publication.
