Description: A circuit breaker is an automatically operated switch that is used to isolate a circuit or large item of machinery from the incoming power. It is designed to operate when a fault condition arises e.g. short circuit or overload, in the same way as a fuse. However it can be reset when the fault condition has been removed. When breaking a high power circuit an arc (or spark) occurs, this can damage the circuit breaker and if the arc is continuous the circuit will not be fully isolated. To prevent this the arc is suppressed by having the contacts surrounded by Sulphur hexafluoride gas (SF6), under oil, in a vacuum or by using an air blast. All types are currently in use but the gas or vacuum type are generally installed, in new systems.

Referencing details: Voltage of circuit i.e. 11kV, Breaking capacity i.e. MVA, Current (amps) e.g. 2,000 amp. Age. Indoors or outdoors.

Cost information notes: -

Rateable element: A schematic MUST be studied. See Class 1 © (i) Class 1 Table 1 (d) and (f) note:- may be attached under first distribution board but still rateable. If different location but first switch after distribution board - not rateable.

Non-rateable element: After first distribution board - see note in rateable element.

Adjusted plant and machinery: The item can typically be found on an industrial, commercial or office complex. Some hereditaments may have multiple items, in which case the ERC needs to reflect the number of items.

Number of items adjusted: Distribution Board, Bus Bar, Generator, Cable, Transformer, Rectifier.

Location factor: Considered Not Applicable at time of Publication

Description: Generally batteries that are rateable have two types of use. Either for supplying power to start standby generators or to provide power over a longer period to keep important electrical systems operational e.g. telephone switchboards or computer systems. they are also used for storing power in 'off-grid' renewable energy systems where the power is typically generated by solar panels or wind. Batteries used for starting standby generators are similar to the batteries used in commercial vehicles and look like a standard car battery but are physically larger. They have a 12 volt rating. Batteries used for other power purposes are generally 2 volt cells connected together to provide the required voltage and storage capacity. Frequently these are in racks or sets of 100 plus cells. The costings are based on a typical battery with a capacity of 925 amp hour for the 2 volt battery and 140 amp hour for the 12 volt battery.

Referencing details: The batteries must be static for power purposes only. Record the following details, 1. Use of batteries, 2. Voltage of batteries, 3. Capacity of batteries in Amp Hours (Ah), 4. Number of batteries connected together, 5. Age.

Unit size: Each

Unit of measurement: Each

ERC: £4,311

Superseded codes: -

Location factor: Considered Not Applicable at time of Publication

Description: Small combined turbine and solar installation affixed to a monopole, typically found in remote sites where access to a small power supply is needed. The turbine produces up to 250W in windy conditions, the solar panel produces a charge when there is sufficient solar luminosity rated at 250w. There is a battery included with the installation which is trickle charged by the turbine and panel. An inverter is included to convert direct to alternating current

Referencing details: See photo herewith and compare to installation on-site. This cost code is for the very small turbines supported by a short stayed pole and of 12V / 24V circa 250W output. The solar panel will usually be around 1m tall by 1.6m wide. Larger wind turbines and multiple solar panel installations are covered elsewhere in the Cost Guide.

Cost information notes: This cost code is for the very small turbines supported by a short stayed pole and of 12V / 24V circa 250W output. The solar panel will usually be around 1m tall by 1.6m wide. Location factor: Considered Not Applicable at time of Publication

Description: Solar panels Many roadside and pipeline installations are now solar panel powered. Panels are also fixed to a roof structure or on a frame to the ground. The more common units are photovoltaic cells, often panels some 2.5 sqm. in size. The current is DC and can be stored in batteries but this is generally converted into AC for onward transmission to the grid. Advances in technology ensure that currents are stable. In these cases the solar energy is used for electrical power.

Referencing details: Typical small commercial installation of solar photovoltaic panels generating electrical power for on-site use. The current produced is DC (Direct Current), but is converted to AC (Alternating Current) by an inverter for use within the hereditament or for export to the National Grid. Installations most commonly comprise mono or polycrystalline panels, each with an installed, capacity of around 250 Watts (W). They are normally roof mounted (but can be ground mounted) and cover approximately 7 sq m per kilowatt (kW = 1000 Watts) of capacity. The estimated replacement cost shown is the cost per kilowatt of installed, capacity (DC) for the full installation which will include solar panels, frames & clamps, inverter(s), isolation switches, generation meter and installation costs. For larger installations (above 50 Kw), or stand-alone sub 50 kW systems find out the installed, capacity, but if not possible, then assume 250 W per panel.

Cost information notes: Prices shown are per kW of installed, capacity.

Rateable element: Panels, supports, cables, inverter, switchgear and all associated controls and ancillary items. Class 1 Table 1 (n) & List of Accessories. The prices shown are inclusive of these elements.

Location factor: Considered Not Applicable at time of Publication

Description: A circuit breaker is an automatically operated switch that is used to isolate a circuit or large item of machinery from the incoming power. It is designed to operate when a fault condition arises e.g. short circuit or overload, in the same way as a fuse. However it can be reset when the fault condition has been removed. When breaking a high power circuit an arc (or spark) occurs, this can damage the circuit breaker and if the arc is continuous the circuit will not be fully isolated. To prevent this the arc is suppressed by having the contacts surrounded by Sulphur hexafluoride gas (SF6), under oil, in a vacuum or by using an air blast. All types are currently in use but the gas or vacuum type are generally installed, in new systems.

Referencing details: Voltage of circuit i.e. 11kV, Breaking capacity i.e. MVA, Current (amps) e.g. 2,000 amp. Age. Indoors or outdoors.

Cost information notes: -

Rateable element: A schematic MUST be studied. See Class 1 © (i) Class 1 Table 1 (d) and (f) note:- may be attached under first distribution board but still rateable. If different location but first switch after distribution board - not rateable.

Non-rateable element: After first distribution board - see note in rateable element.

Adjusted plant and machinery: The item can typically be found on an industrial, commercial or office complex. Some hereditaments may have multiple items, in which case the ERC needs to reflect the number of items.

Number of items adjusted: Distribution Board, Bus Bar, Generator, Cable, Transformer, Rectifier.

Contract size adjustment: See Appendix BEAMS Note 1

Tech 1: Breaking Capacity 500MVA

Tech 2: Amps 1,600

Unit size: -

Unit of measurement: Each

ERC: £56,852

Superseded codes: -

Location factor: Considered Not Applicable at time of Publication

Description: A circuit breaker is an automatically operated switch that is used to isolate a circuit or large item of machinery from the incoming power. It is designed to operate when a fault condition arises e.g. short circuit or overload, in the same way as a fuse. However it can be reset when the fault condition has been removed. When breaking a high power circuit an arc (or spark) occurs, this can damage the circuit breaker and if the arc is continuous the circuit will not be fully isolated. To prevent this the arc is suppressed by having the contacts surrounded by Sulphur hexafluoride gas (SF6), under oil, in a vacuum or by using an air blast. All types are currently in use but the gas or vacuum type are generally installed, in new systems.

Referencing details: Voltage of circuit i.e. 11kV, Breaking capacity i.e. MVA, Current (amps) e.g. 2,000 amp. Age. Indoors or outdoors.

Cost information notes: -

Rateable element: A schematic MUST be studied. See Class 1 © (i) Class 1 Table 1 (d) and (f) note:- may be attached under first distribution board but still rateable. If different location but first switch after distribution board - not rateable.

Non-rateable element: After first distribution board - see note in rateable element.

Adjusted plant and machinery: The item can typically be found on an industrial, commercial or office complex. Some hereditaments may have multiple items, in which case the ERC needs to reflect the number of items.

Number of items adjusted: Distribution Board, Bus Bar, Generator, Cable, Transformer, Rectifier.

Contract size adjustment: See Appendix BEAMS Note 1

Electrics

CG Code: 207D01

Specific: Diesel Engine - Alternator - Set 1100rpm

Descriptive: 324kW (M) of engine

Tech 1: Free standing - 50Hz 415V alternator

Tech 2: 348kVA alternator

Unit size: -

Unit of measurement: Each

ERC: £141,766

Superseded codes: -

Location factor: Considered Not Applicable at time of Publication

Description: Diesel Generator (SET) Comprising of several Class 1 rateable items, including within List of Accessories 2 (i) - (viii). These SETS can be found in a variety of hereditaments where the electrical supply may fail or needs to be supplemented. In most cases generation will be at 415V although in industrial complexes where greater demand is required 11kV SETS are employed. Each SET is calibrated upon installation and therefore forms one complete unit. Usually generator works at 50 Hz and 3 phase, normal working speed is 1500rpm,where used periodically, however for continuous use often lower speeds of 1100rpm are adopted AUTOMATIC START-UP with Acoustic box or enclosure.

Referencing details: 1. Output of alternator (kVa) 2. Age 3. Voltage 4. Within acoustic box or in generating room. A record must be made when the rpm = 1000 . The number of cylinders to the diesel engine and the kW (M) of the engine should recorded where available.

Cost information notes: Costs for freestanding units are some 10% to 17% less than those with mains failure control and contained in acoustic boxes. Costs of boxes reducing acoustic levels whist ensuring adequate cooling, increases due to size of engine and kVa of alternator.

Rateable element: Class 1 Table 1(b) internal combustion engines and (I)other motors. Class 1 Table 1 (k) shafting Class1 Table 1 (c) Continuous and alternating current.

Non-rateable element: -

Adjusted plant and machinery: The item can typically be found on an industrial, commercial or office complex. Some hereditaments may have multiple items, in which case the ERC needs to reflect the number of items.

Number of items adjusted: Given the specifications of the items used for cost reference purposes, such that "packaged" generator sets tend to include sufficient tankage for several hours running, it is assumed that these "enclosed" sets include fuel tanks. Free standing,

(that is a set installed, inside a building so not needing to be inside a bespoke noise attenuated enclosure) requires an addition to be made for fuel storage. All costs include for exhaust extraction.

Contract size adjustment: See Appendix BEAMS Note 1

Non-rateable element: -

Adjusted plant and machinery: The item can typically be found on an industrial, commercial or office complex. Some hereditaments may have multiple items, in which case the ERC needs to reflect the number of items.

Number of items adjusted: Normal batteries included in SET. EXTRA 3 or 4 batteries rated at 12 Volts, which will give a high power boost (as starting a car engine) to start the diesel

engine. Concrete base or strengthened concrete floor. Fuel storage tank. Foundations, settings, tank (fuel).

Contract size adjustment: See Appendix BEAMS Note 1

Variations: Given the specifications of the items used for cost reference purposes, such that "packaged" generator sets tend to include sufficient tankage for several hours running, it is assumed that these "enclosed" sets include fuel tanks. Free standing, (that is a set installed, inside a building so not needing to be inside a bespoke noise attenuated enclosure) requires an addition to be made for fuel storage. All costs include for exhaust extraction.

CG Code: 207D100

Specific: Diesel Engine - Alternator - Set 1500rpm

Descriptive: In Acoustic Box - 50Hz 415V alternator

Tech 1: No engine details

Tech 2: 1500kVA alternator

Unit size: -

Unit of measurement: Each

ERC: £372,818

Superseded codes: -

Location factor: Considered Not Applicable at time of Publication

Description: Diesel Generator (SET) Comprising of several Class 1 rateable items, including within List of Accessories 2 (i) - (viii). These SETS can be found in a variety of hereditaments where the electrical supply may fail or needs to be supplemented. In most cases generation will be at 415V although in industrial complexes where greater demand is required 11kV SETS are employed. Each SET is calibrated upon installation and therefore forms one complete unit. Usually generator works at 50 Hz and 3 phase, normal working speed is 1500rpm,where used periodically, however for continuous use often lower speeds of 1100rpm are adopted AUTOMATIC START-UP with Acoustic box or enclosure.

Referencing details: 1. Output of alternator (kVa) 2. Age 3. Voltage 4. Within acoustic box or in generating room. A record must be made when the rpm = 1000 . The number of cylinders to the diesel engine and the kW (M) of the engine should recorded where available.

Cost information notes: Costs for freestanding units are some 10% to 17% less than those with mains failure control and contained in acoustic boxes. Costs of boxes reducing acoustic levels whist ensuring adequate cooling, increases due to size of engine and kVa of alternator.

Rateable element: Class 1 Table 1(b) internal combustion engines and (I)other motors. Class 1 Table 1 (k) shafting Class1 Table 1 (c) Continuous and alternating current.

Non-rateable element: -

Referencing details: 1. Output of alternator (kVa) 2. Age 3. Voltage 4. Within acoustic box or in generating room. A record must be made when the rpm = 1000 . The number of cylinders to the diesel engine and the kW (M) of the engine should recorded where available.

Cost information notes: Costs for freestanding units are some 10% to 17% less than those with mains failure control and contained in acoustic boxes. Costs of boxes reducing acoustic levels whist ensuring adequate cooling, increases due to size of engine and kVa of alternator.

Rateable element: Class 1 Table 1(b) internal combustion engines and (I)other motors. Class 1 Table 1 (k) shafting Class1 Table 1 (c) Continuous and alternating current.

Non-rateable element: -

Adjusted plant and machinery: The item can typically be found on an industrial, commercial or office complex. Some hereditaments may have multiple items, in which case the ERC needs to reflect the number of items.

Number of items adjusted: Normal batteries included in SET. EXTRA 3 or 4 batteries rated at 12 Volts, which will give a high power boost (as starting a car engine) to start the diesel

engine. Concrete base or strengthened concrete floor. Fuel storage tank. Foundations, settings, tank (fuel).

Contract size adjustment: See Appendix BEAMS Note 1

Variations: Given the specifications of the items used for cost reference purposes, such that "packaged" generator sets tend to include sufficient tankage for several hours running, it is assumed that these "enclosed" sets include fuel tanks. Free standing, (that is a set installed, inside a building so not needing to be inside a bespoke noise attenuated enclosure) requires an addition to be made for fuel storage. All costs include for exhaust extraction.

Description: Diesel Generator (SET) Comprising of several Class 1 rateable items, including within List of Accessories 2 (i) - (viii). These SETS can be found in a variety of hereditaments where the electrical supply may fail or needs to be supplemented. In most cases generation will be at 415V although in industrial complexes where greater demand is required 11kV SETS are employed. Each SET is calibrated upon installation and therefore forms one complete unit. Usually generator works at 50 Hz and 3 phase, normal working speed is 1500rpm,where used periodically, however for continuous use often lower speeds of 1100rpm are adopted AUTOMATIC START-UP with Acoustic box or enclosure.

Referencing details: 1. Output of alternator (kVa) 2. Age 3. Voltage 4. Within acoustic box or in generating room. A record must be made when the rpm = 1000 . The number of cylinders to the diesel engine and the kW (M) of the engine should recorded where available.

Description: Diesel Generator (SET) Comprising of several Class 1 rateable items, including within List of Accessories 2 (i) - (viii). These SETS can be found in a variety of hereditaments where the electrical supply may fail or needs to be supplemented. In most cases generation will be at 415V although in industrial complexes where greater demand is required 11kV SETS are employed. Each SET is calibrated upon installation and therefore forms one complete unit. Usually generator works at 50 Hz and 3 phase, normal working speed is 1500rpm,where used periodically, however for continuous use often lower speeds of 1100rpm are adopted AUTOMATIC START-UP with Acoustic box or enclosure.

Referencing details: 1. Output of alternator (kVa) 2. Age 3. Voltage 4. Within acoustic box or in generating room. A record must be made when the rpm = 1000 . The number of cylinders to the diesel engine and the kW (M) of the engine should recorded where available.

Cost information notes: Costs for freestanding units are some 10% to 17% less than those with mains failure control and contained in acoustic boxes. Costs of boxes reducing acoustic levels whist ensuring adequate cooling, increases due to size of engine and kVa of alternator.

Rateable element: Class 1 Table 1(b) internal combustion engines and (I)other motors. Class 1 Table 1 (k) shafting Class1 Table 1 (c) Continuous and alternating current.

Non-rateable element: -

Adjusted plant and machinery: The item can typically be found on an industrial, commercial or office complex. Some hereditaments may have multiple items, in which case the ERC needs to reflect the number of items.

Number of items adjusted: Normal batteries included in SET. EXTRA 3 or 4 batteries rated at 12 Volts, which will give a high power boost (as starting a car engine) to start the diesel

engine. Concrete base or strengthened concrete floor. Fuel storage tank. Foundations, settings, tank (fuel).

Contract size adjustment: See Appendix BEAMS Note 1

Variations: Given the specifications of the items used for cost reference purposes, such that "packaged" generator sets tend to include sufficient tankage for several hours running, it is assumed that these "enclosed" sets include fuel tanks. Free standing, (that is a set installed, inside a building so not needing to be inside a bespoke noise attenuated enclosure) requires an addition to be made for fuel storage. All costs include for exhaust extraction.

CG Code: 207D65

Specific: Diesel Engine - Alternator - Set 1500rpm

Descriptive: In acoustic box - 50Hz 415V alternator

Tech 1: 611kW (M) of engine

Tech 2: 600kVA alternator

Unit size: -

Unit of measurement: Each

ERC: £137,465

Superseded codes: -

Location factor: Considered Not Applicable at time of Publication

Description: Diesel Generator (SET) Comprising of several Class 1 rateable items, including within List of Accessories 2 (i) - (viii). These SETS can be found in a variety of hereditaments where the electrical supply may fail or needs to be supplemented. In most cases generation will be at 415V although in industrial complexes where greater demand is required 11kV SETS are employed. Each SET is calibrated upon installation and therefore forms one complete unit. Usually generator works at 50 Hz and 3 phase, normal working speed is 1500rpm,where used periodically, however for continuous use often lower speeds of 1100rpm are adopted AUTOMATIC START-UP with Acoustic box or enclosure.

Referencing details: 1. Output of alternator (kVa) 2. Age 3. Voltage 4. Within acoustic box or in generating room. A record must be made when the rpm = 1000 . The number of cylinders to the diesel engine and the kW (M) of the engine should recorded where available.

Cost information notes: Costs for freestanding units are some 10% to 17% less than those with mains failure control and contained in acoustic boxes. Costs of boxes reducing acoustic levels whist ensuring adequate cooling, increases due to size of engine and kVa of alternator.

Rateable element: Class 1 Table 1(b) internal combustion engines and (I)other motors. Class 1 Table 1 (k) shafting Class1 Table 1 (c) Continuous and alternating current.

Non-rateable element: -

Adjusted plant and machinery: The item can typically be found on an industrial, commercial or office complex. Some hereditaments may have multiple items, in which case the ERC needs to reflect the number of items.

Number of items adjusted: Normal batteries included in SET. EXTRA 3 or 4 batteries rated at 12 Volts, which will give a high power boost (as starting a car engine) to start the diesel

engine. Concrete base or strengthened concrete floor. Fuel storage tank. Foundations, settings, tank (fuel).

Contract size adjustment: See Appendix BEAMS Note 1

Variations: Given the specifications of the items used for cost reference purposes, such that "packaged" generator sets tend to include sufficient tankage for several hours running, it is assumed that these "enclosed" sets include fuel tanks. Free standing, (that is a set installed, inside a building so not needing to be inside a bespoke noise attenuated enclosure) requires an addition to be made for fuel storage. All costs include for exhaust extraction.

Adjusted plant and machinery: The item can typically be found on an industrial, commercial or office complex. Some hereditaments may have multiple items, in which case the ERC needs to reflect the number of items.

Number of items adjusted: Given the specifications of the items used for cost reference purposes, such that "packaged" generator sets tend to include sufficient tankage for several hours running, it is assumed that these "enclosed" sets include fuel tanks. Free standing,

(that is a set installed, inside a building so not needing to be inside a bespoke noise attenuated enclosure) requires an addition to be made for fuel storage. All costs include for exhaust extraction.

Contract size adjustment: See Appendix BEAMS Note 1

Variations: Given the specifications of the items used for cost reference purposes, such that "packaged" generator sets tend to include sufficient tankage for several hours running, it is assumed that these "enclosed" sets include fuel tanks. Free standing, (that is sets installed, inside buildings and so not needing to be inside a bespoke noise attenuated enclosure) require an addition to be made for fuel storage. All costs include for exhaust extraction.

Electrics

CG Code: 207D79

Specific: Diesel Engine - Alternator - Set 1500rpm

Descriptive: Free standing - 50Hz 415V alternator

Tech 1: 180kW(M) of engine

Tech 2: 200kVA alternator

Unit size: -

Unit of measurement: Each

ERC: £60,606

Superseded codes: -

Location factor: Considered Not Applicable at time of Publication

Description: Diesel Generator (SET) Comprising of several Class 1 rateable items, including within List of Accessories 2 (i) - (viii). These SETS can be found in a variety of hereditaments where the electrical supply may fail or needs to be supplemented. In most cases generation will be at 415V although in industrial complexes where greater demand is required 11kV SETS are employed. Each SET is calibrated upon installation and therefore forms one complete unit. Usually generator works at 50 Hz and 3 phase, normal working speed is 1500rpm,where used periodically, however for continuous use often lower speeds of 1100rpm are adopted AUTOMATIC START-UP with Acoustic box or enclosure.

Referencing details: 1. Output of alternator (kVa) 2. Age 3. Voltage 4. Within acoustic box or in generating room. A record must be made when the rpm = 1000 . The number of cylinders to the diesel engine and the kW (M) of the engine should recorded where available.

Cost information notes: Costs for freestanding units are some 10% to 17% less than those with mains failure control and contained in acoustic boxes. Costs of boxes reducing acoustic levels whist ensuring adequate cooling, increases due to size of engine and kVa of alternator.

Rateable element: Class 1 Table 1(b) internal combustion engines and (I)other motors. Class 1 Table 1 (k) shafting Class1 Table 1 (c) Continuous and alternating current.

Non-rateable element: -

Adjusted plant and machinery: The item can typically be found on an industrial, commercial or office complex. Some hereditaments may have multiple items, in which case the ERC needs to reflect the number of items.

Number of items adjusted: Normal batteries included in SET. EXTRA 3 or 4 batteries rated at 12 Volts, which will give a high power boost (as starting a car engine) to start the diesel

engine. Concrete base or strengthened concrete floor. Fuel storage tank. Foundations, settings, tank (fuel).

Contract size adjustment: See Appendix BEAMS Note 1

Variations: Given the specifications of the items used for cost reference purposes, such that "packaged" generator sets tend to include sufficient tankage for several hours running, it is assumed that these "enclosed" sets include fuel tanks. Free standing, (that is a set installed, inside a building so not needing to be inside a bespoke noise attenuated enclosure) requires an addition to be made for fuel storage. All costs include for exhaust extraction.

Each SET is calibrated upon installation and therefore forms one complete unit. Usually generator works at 50 Hz and 3 phase, normal working speed is 1500rpm,where used periodically, however for continuous use often lower speeds of 1100rpm are adopted AUTOMATIC START-UP with Acoustic box or enclosure.

Referencing details: 1. Output of alternator (kVa) 2. Age 3. Voltage 4. Within acoustic box or in generating room. A record must be made when the rpm = 1000 . The number of cylinders to the diesel engine and the kW (M) of the engine should recorded where available.

Cost information notes: Costs for freestanding units are some 10% to 17% less than those with mains failure control and contained in acoustic boxes. Costs of boxes reducing acoustic levels whist ensuring adequate cooling, increases due to size of engine and kVa of alternator.

Rateable element: Class 1 Table 1(b) internal combustion engines and (I)other motors. Class 1 Table 1 (k) shafting Class1 Table 1 (c) Continuous and alternating current.

Non-rateable element: -

Adjusted plant and machinery: The item can typically be found on an industrial, commercial or office complex. Some hereditaments may have multiple items, in which case the ERC needs to reflect the number of items.

Number of items adjusted: Normal batteries included in SET. EXTRA 3 or 4 batteries rated at 12 Volts, which will give a high power boost (as starting a car engine) to start the diesel

engine. Concrete base or strengthened concrete floor. Fuel storage tank. Foundations, settings, tank (fuel).

Contract size adjustment: See Appendix BEAMS Note 1

Variations: Given the specifications of the items used for cost reference purposes, such that "packaged" generator sets tend to include sufficient tankage for several hours running, it is assumed that these "enclosed" sets include fuel tanks. Free standing, (that is a set installed, inside a building so not needing to be inside a bespoke noise attenuated enclosure) requires an addition to be made for fuel storage. All costs include for exhaust extraction.

Descriptive: Training Gallop with fencing and silica sand - synthetic topping.

Tech 1: PVC Granules

Tech 2: 100mm

Unit size: -

Unit of measurement: m2

ERC: £46

Superseded codes: -

Location factor: Location Adjustment Applicable (See Guidance Notes) - ERC = UK mean of 1.00

Description: External Equine Gallop with built in drainage and synthetic topping layer mixed with silica sand. Cost based on one furlong (201m) includes drainage within the gallop, enclosure fence and the appropriate topping material specific to the code. Excludes retaining boards and lighting.

Referencing details: Measure the length and breadth of the gallop at the fence line.

Cost information notes: Cost based on one furlong (201m) includes drainage within the gallop, enclosure fence and the appropriate topping material specific to the code. Excludes retaining boards and lighting.

Rateable element: -

Non-rateable element: -

Adjusted plant and machinery: -

Number of items adjusted: -

Contract size adjustment: See Appendix BEAMS Note 2

Variations: Cost is a unit rate so size variations can be accommodated by pro rata.

Equine

Equine

CG Code: 61E27A

Specific: Horse Walker

Descriptive: Training Walker with fencing and silica sand without topping layer.

Tech 1: 12m Diameter inner fence

Tech 2: 4m wide exercise surface

Unit size: -

Unit of measurement: Each

ERC: £31,894

Superseded codes: 61E27B

Location factor: Location Adjustment Applicable (See Guidance Notes) - ERC = UK mean of 1.00

Description: External Equine Training Walker with built in drainage excluding topping layer but including silica sand. Cost includes drainage within the walker, walker rotator, switchgear and fencing. Does not include walker roof. See Variations for advice on further additions or deductions.

Referencing details: -

Cost information notes: Rate includes drainage within the walker, enclosure fences and the walker rotator.

Rateable element: -

Non-rateable element: -

Adjusted plant and machinery: -

Number of items adjusted: -

Contract size adjustment: See Appendix BEAMS Note 2

Variations: Add for topping material. Costs for surfaces are: 100mm Flexi Fibre use code 61E27V1; 100mm PVC Granules use code 61E27V2; 100mm Rubber Chippings use code 61E27V3; 100mm Shredded Rubber 61E27V4. Area of training surface is 804 m2. Deduct using code 61E27V5 to exclude Walker rotator and controls. Add using code 61E27V6 per lighting column.

Equine

CG Code: 61E28A

Specific: Cantilevered Covering Over Canterway

Descriptive: Steel Framed Cantilever structure with roof and one side enclosed.

Tech 1: -

Tech 2: -

Unit size: -

Unit of measurement: m

ERC: £680

Superseded codes: -

Location factor: Location Adjustment Applicable (See Guidance Notes) - ERC = UK mean of 1.00

Description: Steel framed cantilevered canterway covering. Columns at 5m centres. Covering to back wall and roof comprise profiled metal sheets supported on galvanised steel rails and purlins. Facia to front and rain water gutters and downpipes to rear. 1.2m brickwork wall to inner side of enclosed side.

Referencing details: Cost based on 5m build up and is per linear metre.

Cost information notes: Cost includes for frame and cladding and brickwork wall only. See Equine Gallop code for topping and exercise track costs. Fencing and flood lighting is not included in cost. Cost based on rear wall height of 5m and cantilevered roof span of 3.5m.

Specific: Acoustic

Descriptive: Acoustic Panels to timber posts

Tech 1: 5.0m high

Tech 2: Posts at 2.75m centres

Unit size: m

Unit of measurement: m

ERC: £538

Superseded codes: -

Location factor: Location Adjustment Applicable (See Guidance Notes) - ERC = UK mean of 1.00

Description: Acoustic fencing 5.0m high, to timber posts 100mm x100mm; 3 no softwood arris rails; 100mm x17mm softwood tongue & groove boards; including excavating and backfilling into firm ground at 1.8m centres; setting in concrete 1:3:6;

Referencing details: Measure length and height

Cost information notes: 5.0 x1.83 Acoustic fence panel, including timber posts, Gravel boards & 100mm x 100mm Posts set 600mm in to firm ground.

Tech 2: 2.1m high

Unit size: m

Unit of measurement: m

ERC: £68

Superseded codes: -

Location factor: Location Adjustment Applicable (See Guidance Notes) - ERC = UK mean of 1.00

Description: Paladin welded mesh colour coated green fencing; fixing to metal posts at 2.975m centres with manufacturers fixings; setting 600mm deep in firm ground - including excavating holes; backfilling and removing surplus excavated material.

Referencing details: Measure length and height. This is similar to unclimbable fencing, but the mesh apertures are larger. Weld mesh is also available in rolls: this is an inferior product and is more akin to chain-link

Cost information notes: Extra over welded galvanised plastic coated mesh fencing for concreting in posts

Location factor: Location Adjustment Applicable (See Guidance Notes) - ERC = UK mean of 1.00

Description: Sprinkler head and pipe work within a factory building. Automatic fire detectors / smoke detectors. Each system is designed for the type of building in which it is to be used and the type of materials being protected. BS 5306 Part 2 1990. (1) High Hazard Class: Occupancies 97 sq ft (9m2) per head e.g. chemical work, petrol storage. (2) Ordinary Hazard Class: Occupancies 130 sq ft (12m2) per head e.g. factories, offices, shops. (3) Light Hazard Class: Occupancies 225 sq ft (21m2) per head e.g. steel stockholding warehouse. In (2) older ordinary hazard class systems usually the town water supply is adequate. However the widespread reduction of town water main pressure has meant that most modern ordinary hazard systems now demand tanks and pump backup system. Assume all modern systems require an addition for a tank, pumps and mains connection pipes ss informed otherwise. For (1) extra high hazard class a pump and tank system is required and a separate addition should be made for this item in all cases. All detection systems of control electrics, pipes and alarms are included in the costs. Town Water only systems are not suitable for life safety applications i.e. as in hotels, offices and shops. Terms: Wet System: Water is in pipe up to sprinkler head at all times. Dry System: Pipe work is charged with air to prevent water lying in pipes used in cold stores or areas where frost damage could occur.

Referencing details: Count or estimate number of heads based on area

Cost information notes: Normal Stacking. Normal height stacking. Fire risk low. Ordinary hazard. Mains water supply. Individual head glass bulb detection. One head every 10m2 - 12m2. The water mains from the town supply to the building and the pipe work in the building is included in these costs. Where applicable the pipe work from a storage tank to the building is included in the costs. Where a ring main is employed or branch mains to items of rateable plant a separate figure is required for the pipe work. Concrete foundations to tanks, motors and pumps are additional costs, as are costs for, insulation to pipes, pipe racks and

pipe supports. All these items are to be rated under Class 2 and List of Accessories 2. (i) to (viii)

Rateable element: Class 2 Table 2 (f) Protection from Hazards List of accessories 2(i), (v), (vii), (viii)

Non-rateable element: -

Adjusted plant and machinery: Alarms, tanks, foundations, pipes, pumps

Number of items adjusted: The item can typically be found on an industrial, commercial or office complex. Some hereditaments may have multiple items, in which case the ERC needs to reflect the number of items.

Contract size adjustment: See Appendix BEAMS Note 2

Where a ring main is employed or branch mains to items of rateable plant a separate figure is required for the pipe work. Concrete foundations to tanks, motors and pumps are additional costs, as are costs for, insulation to pipes, pipe racks and pipe supports. All these items are to be rated under Class 2 and List of Accessories 2. (i) to (viii)

Rateable element: Class 2 Table 2 (f) Protection from Hazards List of accessories 2(i), (v), (vii), (viii)

Non-rateable element: -

Adjusted plant and machinery: Alarms, tanks, foundations, pipes, pumps

Number of items adjusted: The item can typically be found on an industrial, commercial or office complex. Some hereditaments may have multiple items, in which case the ERC needs to reflect the number of items.

Contract size adjustment: See Appendix BEAMS Note 2

Variations: -

Fire protection

CG Code: 208A22

Specific: Firewater header tank

Descriptive: Including pump set + pipes

Tech 1: Average cost where details unknown

Tech 2: Serving up to 100 sprinkler heads

Unit size: Each

Unit of measurement: Each

ERC: £151,045

Superseded codes: -

Location factor: Location Adjustment Applicable (See Guidance Notes) - ERC = UK mean of 1.00

Description: Water pumps and engine together with valves and automatic control to serve firewater header tank to deliver required pressure and volume of water to sprinkler system. Usually tank and pump system is situated outside the main building but can be on roof in some circumstances. Usually system is painted RED

Referencing details: -

Cost information notes: Apply where full details of system are unknown. This is an average cost for tank, pumps, engine and distribution pipework. Cost excludes sprinkler heads, detection and alarm. Add for sprinkler system per 208D01 at 950 per sprinkler head.

Rateable element: -

Non-rateable element: -

Adjusted plant and machinery: Sprinkler heads, fire detection and alarm system.

Number of items adjusted: The item can typically be found on an industrial, commercial or office complex. Some hereditaments may have multiple items, in which case the ERC needs to reflect the number of items.

Contract size adjustment: See Appendix BEAMS Note 2

Variations: -

Fire protection

CG Code: 208A23

Specific: Firewater header tank

Descriptive: Including pump set + pipes

Tech 1: Average cost where details unknown

Tech 2: Serving over 100 heads

Unit size: Each

Unit of measurement: Each

ERC: £169,926

Superseded codes: -

Location factor: Location Adjustment Applicable (See Guidance Notes) - ERC = UK mean of 1.00

Description: Water pumps and engine together with valves and automatic control to serve firewater header tank to deliver required pressure and volume of water to sprinkler system. Usually tank and pump system is situated outside the main building but can be on roof in some circumstances. Usually system is painted RED

Referencing details: -

Cost information notes: This is an average cost where details are unknown. Excludes cost of sprinklers, fire detection and alarm. Add to cost of sprinklers per 208D01 at 950 per sprinkler head.

Rateable element: Class 2 Table 2 (f) Protection from Hazards

Non-rateable element: -

Adjusted plant and machinery: Sprinklers, fire detection and alarm.

Number of items adjusted: The item can typically be found on an industrial, commercial or office complex. Some hereditaments may have multiple items, in which case the ERC needs to reflect the number of items.

Contract size adjustment: See Appendix BEAMS Note 2

Variations: -

Fire protection

CG Code: 208A50

Specific: Firewater header tank

Descriptive: Excluding pump set + pipes

Tech 1: Including foundations

Tech 2: 400m³

Unit size: Each

Unit of measurement: Each

ERC: £106,180

Superseded codes: -

Location factor: Considered Not Applicable at time of Publication

Description: These tanks are similar in design and construction to the tanks on a Commercial Tank Farm. Tanks under 400 cu m are rateable as these tanks are rated under the List of Accessories. Cost for average foundations included.

Referencing details: Note capacity of tank and dimensions where possible. Note pump rooms or chambers and sizes. Age

Cost information notes: Foundation costs are included for this code Costs based on 400m3 tank installation Cost of pump and engine/motor to be added.

Rateable element: Class 2 Table 2 (f) Protection from Hazards fire and explosion - fire protection (List of Accessories 2 (v) tanks)

Non-rateable element: -

Adjusted plant and machinery: -

Number of items adjusted: Pumps, engine and sprinkler system

Contract size adjustment: See Appendix BEAMS Note 2

Variations: -

Fire protection

CG Code: 208A51

Specific: Firewater header tank

Descriptive: Excluding pump set + pipes

Fire Protection

CG Code: 208B05

Specific: Fire Hydrants

Descriptive: Monitor

Tech 1: Water

Tech 2: 150mm cast iron dry barrel. 150 psig 100mm monitor bend

Unit size: Each

Unit of measurement: Each

ERC: £5,326

Superseded codes: -

Location factor: Location Adjustment Applicable (See Guidance Notes) - ERC = UK mean of 1.00

Description: MONITOR - A device with a nozzle. The whole unit can be hand turned by a metal extension bar. The nozzle and control either fit over the top of the rising main in one unit or form part of a normal hydrant with a 90 degree upwards turn to take the monitor. The Rose can be adjusted to ensure a spray mist if required or a powerful water jet. Normal pressure is 100-150 psig whilst high pressure is regarded as 250 psig. Monitors may deliver foam instead of water.

Referencing details: Number of monitors around the site.

Cost information notes: Fire Monitors (Hydrants) - Fire Hydrant (Water) 150mm nominal bore cast iron dry barrel pillar hydrant with main internal valve and automatic drain off. Outlets fitted with 100mm monitor bend Costs do not include water storage tanks or water pumps. The fire hydrant is adapted to have a monitor fitted onto it. Usually both hydrant and monitor are permanently fixed on-site.

Rateable element: Class 2 Table 2 (f) Protection from Hazards fire or other hazard. Hydrants, Monitors.

Non-rateable element: -

Adjusted plant and machinery: Pumps, tanks, pipes, fire alarm systems. Inert gas systems.

Number of items adjusted: The item can typically be found on an industrial, commercial or office complex. Some hereditaments may have multiple items, in which case the ERC needs to reflect the number of items.

Contract size adjustment: See Appendix BEAMS Note 2

Variations: -

Fire Protection

Tech 1: 132mm cast iron construction

Tech 2: 150 psig

Unit size: Each

Unit of measurement: Each

ERC: £5,575

Superseded codes: -

Location factor: Location Adjustment Applicable (See Guidance Notes) - ERC = UK mean of 1.00

Description: HYDRANT - A gunmetal pillar above the ground, which includes some pipework below ground usually ending with, a 90 degree turn. The pumps, below ground pipes, manholes etc. are not included in these costings. The BRITISH fire hydrant is usually a 200mm diameter tube reducing to 150mm diameter. At right angles to the upright some 1 metre above ground are 4 connections in line. The AMERICAN fire hydrant is of similar size and design but has 4 arms projecting out at 90 degrees to each other situated some 750mm above ground. MONITOR - A device with a nozzle. The whole unit can be hand turned by a metal extension bar. The nozzle and control either fit over the top of the rising main in one unit or form part of a normal hydrant with a 90 degree upwards turn to take the monitor. The Rose can be adjusted to ensure a spray mist if required or a powerful water jet. Normal pressure is 100-150 psig whilst high pressure is regarded as 250 psig. Monitors may deliver foam instead of water.

Referencing details: Number and location of hydrants, covers or monitors on-site

Cost information notes: Fire Hydrants - Cast iron dry barrel pillar type at 150 psig. Inlet at base 150mm right angle flange. Outlet 1 male pumper nozzle 1 monitor elbow 2 globe valves with female Blank cap and chain. Cost does not include water storage tanks or water pumps. The fire hydrant is adapted to have a monitor fitted onto it. Usually both hydrant and monitor are permanently fixed on-site.

Rateable element: Class 2 Table 2 (f) Protection from Hazards fire or other hazard. Hydrants, Monitors.

Non-rateable element: -

Adjusted plant and machinery: Pumps, tanks, pipes, fire alarm systems. Inert gas systems.

Descriptive: Argon gas for compartment within complex

Tech 1: Based on floor area

Tech 2: 81m² x 3m ht

Unit size: -

Unit of measurement: Each

ERC: £209

Superseded codes: -

Location factor: Location Adjustment Applicable (See Guidance Notes) - ERC = UK mean of 1.00

Description: In many specialist areas water is not an appropriate medium especially where electrical or sensitive items are stored. Over the years various inert gases have been used and the heavier inert gases are preferred. CO2 is often employed in areas where humans do not work but where the workforce is employed Argon is the most popular gas. The gas is stored in pressure vessels and when released forms a gas blanket which drops to the floor of the building and knocks out oxygen. The costs for the pipes and the heads is the same as for water sprinkler systems (see appropriate section) Once the system has been discharged it has to be re charged

Referencing details: Record medium of protection used, storage vessels , sizes and age Where appropriate - number of outlets.

Cost information notes: Location within industrial complex - Argon Gas Control Room 185.6m2 x 3.5m high (main control room with computer control systems) Based on floor area. To include tanks, electrical detection system, pipes, and pipe supports, heads, installation and controls including alarms.

CO2 is often employed in areas where humans do not work but where the workforce is employed Argon is the most popular gas. The gas is stored in pressure vessels and when released forms a gas blanket which drops to the floor of the building and knocks out oxygen. The costs for the pipes and the heads is the same as for water sprinkler systems (see appropriate section) Once the system has been discharged it has to be re charged

Referencing details: Record medium of protection used, storage vessels , sizes and age Where appropriate - number of outlets.

Cost information notes: Location within industrial complex - Argon Gas Control Room 185.6m2 x 3.5m high (main control room with computer control systems) Based on floor area. To include tanks, electrical detection system, pipes, and pipe supports, heads, installation and controls including alarms.

Rateable element: Class 2 Table 2 (f) Protection from Hazards fire and explosion protection and suppressions systems. List of Accessories 2 (v) pipes, tanks, valves. (viii) instruments ….

Non-rateable element: -

Adjusted plant and machinery: -

Number of items adjusted: The item can typically be found on an industrial, commercial or office complex. Some hereditaments may have multiple items, in which case the ERC needs to reflect the number of items.

Contract size adjustment: See Appendix BEAMS Note 2

Variations: -

Tech 2: 36m² x 3.5m ht

Unit size: m3

Unit of measurement: Each

ERC: £95

Superseded codes: -

Location factor: Location Adjustment Applicable (See Guidance Notes) - ERC = UK mean of 1.00

Description: In many specialist areas water is not an appropriate medium especially where electrical or sensitive items are stored. Over the years various inert gases have been used and the heavier inert gases are preferred. CO2 is often employed in areas where humans do not work but where the workforce is employed Argon is the most popular gas. The gas is stored in pressure vessels and when released forms a gas blanket which drops to the floor of the building and knocks out oxygen. The costs for the pipes and the heads is the same as for water sprinkler systems (see appropriate section) Once the system has been discharged it has to be re charged

Referencing details: Record medium of protection used, storage vessels , sizes and age Where appropriate - number of outlets.

Cost information notes: Location within industrial complex - Argon Gas Control Room 185.6m2 x 3.5m high (main control room with computer control systems) Based on floor area. To include tanks, electrical detection system, pipes, and pipe supports, heads, installation and controls including alarms.

Descriptive: Outside and round plant

Tech 1: -

Tech 2: -

Unit size: Each

Unit of measurement: Each

ERC: £1,227

Superseded codes: -

Location factor: Considered Not Applicable at time of Publication

Description: The assumption is that the pressure in the street mains is sufficient to supply the whole system continuously (or until the fire engines arrive). Costs are based on the number of heads. This includes:- mains pipes from the boundary fence to the building, control and regulation valves including gauges and dials, mains pipework (and supports) throughout the buildings, branch pipework (and supports) and the head mechanism itself. Also included are the detection devices, alarm systems and the computer control / display equipment. The type of goods / assets being protected are assessed and the number of heads are calculated to suit BS 5306 Part 2 1990. Mains street supply with no extra pumping is assumed.
(i) High Hazard Class :- Occupancies 97 sq ft (9m2) per head e.g. chemical work, petrol storage. (ii) Ordinary Hazard Class :- Occupancies 130 sq ft (12m2) per head e.g. factories, offices, shops. (iii) Light Hazard Class :- Occupancies 225 sq ft (21m2) per head e.g. steel stockholders, warehousing of inert materials.
The greater the Hazard rating the more densely the bulbs are located and thus the greater number required. The heads become active when the heat from below a certain section is so great it expands the liquid held in the glass head bulb whereupon the bulb breaks. This allows the water to flow - the water hits the star shaped device fitted above the bulb whereupon the water forms a shower. In many cases the bulbs released at any one time may be restricted thus not causing undue water damage. The system may have water behind the bulb but in many cases, especially in shops and offices the system is dry - air holds back the water. The release of the bulb allows the water behind the air to drive it out and spray water as normal. In many cases a control "a dry riser" can be noted. The water requirement for over 100 heads is significant.

Referencing details: Count or estimate the total number of heads served by one mains connection (there may be more than one building on-site). NB there may be more than one mains connection

Cost information notes: Where firewater header tanks are employed, pumps etc see Cost Guide for additional costings. High Hazard Class may require these extra facilities. This addition is usually applied where a life safety situation arises e.g.. shops, offices, hotels

Rateable element: Class 2 Table 2 (f) Protection from Hazards fire and explosion protection and suppression systems. List of Accessories 2 (i) to (viii) incl

Non-rateable element: -

Adjusted plant and machinery: Fire ring mains, firewater header tanks, firewater pump sets, fire alarm systems (no sprinklers)

Number of items adjusted: The item can typically be found on an industrial, commercial or office complex. Some hereditaments may have multiple items, in which case the ERC needs to reflect the number of items.

Contract size adjustment: See Appendix BEAMS Note 2

Variations: -

Fire protection

CG Code: 208M28

Specific: Fire ring mains

Descriptive: Underground in trench average 1m deep

Tech 1: Site distribution - per lin metre

Tech 2: 150mm dia. - ductile iron

Unit size: per lin metre

Unit of measurement: m

ERC: £120

Superseded codes: -

Location factor: Considered Not Applicable at time of Publication

Description: HYDRANT - A gunmetal pillar above the ground, which includes some pipework below ground usually ending with, a 90 degree turn. The pumps, below ground pipes, manholes etc. are not included in these costings. The BRITISH fire hydrant is usually a 200mm diameter tube reducing to 150mm diameter. At right angles to the upright some 1 metre above ground are 4 connections in line. The AMERICAN fire hydrant is of similar size and design but has 4 arms projecting out at 90 degrees to each other situated some 750mm above ground. MONITOR - A device with a nozzle. The whole unit can be hand turned by a metal extension bar. The nozzle and control either fit over the top of the rising main in one unit or form part of a normal hydrant with a 90 degree upwards turn to take the monitor. The Rose can be adjusted to ensure a spray mist if required or a powerful water jet. Normal pressure is 100-150 psig whilst high pressure is regarded as 250 psig. Monitors may deliver foam instead of water.

Referencing details: To be costed with full sprinkler system. including for Pump/engine set.

Cost information notes: Apply where full details of system are unknown. This is an average cost for tank, pumps, engine and distribution pipework. Cost excludes sprinkler heads, detection and alarm. Add for sprinkler system per 208D01 at 950 per sprinkler head.

Rateable element: Class 2 Table 2 (f) Protection from Hazards fire or other hazard. Hydrants, Monitors.

Non-rateable element: -

Adjusted plant and machinery: Pumps, tanks, pipes, fire alarm systems. Inert gas systems.

Number of items adjusted: The item can typically be found on an industrial, commercial or office complex. Some hereditaments may have multiple items, in which case the ERC needs to reflect the number of items.

Location factor: Considered Not Applicable at time of Publication

Description: Tanks for storing water ready for use with a firefighting system.

Referencing details: Calculate the cubic capacity of the tank.

Cost information notes: Cost figures are generally marginally below that of a refinery tank to reflect bolted construction and slightly lower specifications. Add for foundations, the amount will depend upon specific installation factors.

Rateable element: Class 2 Table 2 (f) Protection from Hazards fire and explosion - fire protection (List of Accessories 2 (v) tanks)

Non-rateable element: -

Flare Stacks

CG Code: 213O01

Specific: Vertical Pipe

Descriptive: -

Tech 1: -

Tech 2: -

Unit size: -

Unit of measurement: Each

ERC: £72,549

Superseded codes: -

Location factor: Considered Not Applicable at time of Publication

Description: Vertical flare stacks are used to safely burn off un-wanted gas. They can be found at sewage treatment works, landfill sites and petro chemical facilities. It should be noted that vertical stacks with open flames are no longer compliant on landfill sites, but can still be used in other situations

Referencing details: The type of installation should be recorded i.e. sewage treatment works / landfill etc. The pressure and flow rate should also be recorded. For vertical stack flares the dimensions of the stack should be recorded.

Cost information notes: The indicative cost is for a stack of around 8m to 10m height as typically found at sewage treatment works. Installed, cost includes foundations. Cost may not be suitable for significantly larger stacks typically found at petro chemical works

Rateable element: Class 2 Table 2 (f) PROTECTION FROM HAZARDS Fire and explosion protection and suppression systems List of Accessories 2 (i) - (viii

Non-rateable element: -

Adjusted plant and machinery: Gas holders, gas turbines, gas engines,

Number of items adjusted: The item can typically be found on a specialist industrial complex. Some hereditaments may have multiple items, in which case the ERC needs to reflect the number of items. Unit size: Each

Unit of measurement: Each

ERC: £108,823

Superseded codes: -

Location factor: Considered Not Applicable at time of Publication

Description: Ground flares are used to safely burn off un-wanted gas. They can be found at sewage treatment works, landfill sites and petro chemical facilities. The gas is burnt off in a controlled way inside a vertical tube with the flame enclosed.

Referencing details: The type of installation should be noted i.e. sewage treatment works, the pressure the system works at and the flow rate.

Cost information notes: Cost is for an installed, system including concrete pad etc. Collection pipework across landfill sites is not to be included

Rateable element: Class 2 Table 2 (f) PROTECTION FROM HAZARDS Fire and explosion protection and suppression systems List of Accessories 2 (i) - (viii

Non-rateable element: -

Adjusted plant and machinery: Gas holders, gas turbines, gas engines, collection pipework on land fill sites.

Number of items adjusted: The item can typically be found on a specialist industrial complex. Some hereditaments may have multiple items, in which case the ERC needs to reflect the number of items.

Contract size adjustment: See Appendix BEAMS Note 1

Variations: -

Tech 1: 150mm thick slab

Tech 2: 7.5m -9.0m to soffit

Unit size: -

Unit of measurement: m2

ERC: £115

Superseded codes: -

Location factor: Location Adjustment Applicable (See Guidance Notes) - ERC = UK mean of 1.00

Description: Reinforced concrete upper floors, rate excludes supporting structure.

Referencing details: Measure floor area =m2.

Cost information notes: Additional cost of steel deck permanent shuttering left in use code 30A04V1

Rateable element: -

Non-rateable element: -

Adjusted plant and machinery: -

Number of items adjusted: -

Contract size adjustment: See Appendix BEAMS Note 2

Variations: Add or deduct for each metre variation in height for below 20m - 30A04V2, for above 20m in height use code 30A04V3. For handrails and access stairs see Stairs.

Floors upper

CG Code: 30A06A

Specific: Reinforced concrete

Descriptive: Excluding supporting structure

Tech 1: 200mm thick slab

Tech 2: < 3m to soffit

Unit size: -

Unit of measurement: m2

ERC: £153

Superseded codes: -

Location factor: Location Adjustment Applicable (See Guidance Notes) - ERC = UK mean of 1.00

Description: Reinforced concrete upper floors, rate excludes supporting structure.

Referencing details: Measure floor area =m2.

Cost information notes: Additional cost of steel deck permanent shuttering left in use code 30A04V1

Rateable element: -

Non-rateable element: -

Adjusted plant and machinery: -

Number of items adjusted: -

Contract size adjustment: See Appendix BEAMS Note 2

Floors upper

CG Code: 30A11A

Specific: Timber on Light Steel Frame

Descriptive: 50mm x 175mm joists

Tech 1: 19mm Chipboard flooring

Tech 2: 3.5m between floors

Unit size: -

Unit of measurement: m2

ERC: £277

Superseded codes: -

Location factor: Location Adjustment Applicable (See Guidance Notes) - ERC = UK mean of 1.00

Description: Light steel universal beams approx. 127 x 76mm section with timber deck of softwood joists and chipboard flooring 3.5m above level of floor below (i.e. floor to floor).

Referencing details: Measure floor area.

Cost information notes: Price is for chipboard, floor joists and supporting beam structure. Structure hung off main building columns. Cost assumes a floor area of 144m2. 15% uplift included in cost to allow for support to existing columns to main building

Rateable element: -

Non-rateable element: -

Adjusted plant and machinery: -

Number of items adjusted: -

Contract size adjustment: See Appendix BEAMS Note 2

Variations: Add or deduct for each metre variation in height for below 20m - 30A04V2, for above 20m in height use code 30A04V3. For handrails and access stairs see Stairs.

Floors upper

CG Code: 30A11F

Specific: Chequer or Durbar Plate on Light Steel Frame

Descriptive: 127mm x 75mm beams

Tech 1: 6mm thick chequer plate

Tech 2: 3.5m between floors

Unit size: -

Unit of measurement: m2

ERC: £306

Superseded codes: -

Location factor: Location Adjustment Applicable (See Guidance Notes) - ERC = UK mean of 1.00

Description: Light steel universal beams approx. 127 x 76mm section with cross bracing. 6mm thick Chequer/Durbar plate flooring 3.5m above level of floor below (i.e. floor to floor).

Referencing details: Measure total areas of plate and thickness.

Cost information notes: Price is for chequer plate and supporting beam structure. Structure hung off main building columns. Cost assumes a floor area of 144m2. 10% uplift included in cost to allow for support to existing columns to main building

Rateable element: -

Description: Bored cast insitu reinforced concrete piles 300mm diameter to maximum depth of 10m on a clear site with reasonable access. The installation covers the provision of the boring rig on-site for one pile. The cost includes disposal of excavated waste material (Inert) on-site.

Referencing details: Based on diameter and depth of piles.

Cost information notes: The cost has no provision for a pile cap for each pile or combination of piles. Enabling Works additional to cost- excavation for piling mat. Making ground good with imported hard-core or similar to form piling mat. The hire of plant that includes arriving and leaving from each site, maintenance, erection and dismantling at each pile position.

Location factor: Location Adjustment Applicable (See Guidance Notes) - ERC = UK mean of 1.00

Description: Bored cast insitu reinforced concrete piles between 300 and 600mm diameter to maximum depth of 30m on a clear site with reasonable access. The installation covers the provision of the boring rig and its removal and transfer between points on-site. The cost of the pile is based on a typical depth and disposal of excavated inert waste material. There will be a pile cap for each pile or combination of piles. The size and depth of piling is entirely dependent upon the loading being imposed and the bearing capacity of the ground upon which the structure is being built. In order to obtain the most accurate estimate of cost then details must be obtained from the actual piling records.

Referencing details: -

Cost information notes: Each pile or combination of piles will be constructed with a pile cap to assist transfer of loads to the pile from the foundations and the structures above. Piles a may be grouped in 2,3 4 or 6 concentrations and linked with a single pile cap. Costs stated above are per pile

Furnaces

CG Code: 209H01

Specific: Heat Treatment

Descriptive: Batch

Tech 1: 250 m3

Tech 2: -

Unit size: m3

Unit of measurement: m3

ERC: £4,301

Superseded codes: -

Location factor: Considered Not Applicable at time of Publication

Description: Heat Treatment Batch Furnaces use heat to change the molecular composition of the metal. This treatment softens the metal and then chilling (by quenching) hardens it again, this is controlled and adjusted depending on the desired end product. Temperatures can range between extremes of 420°C and 1800°C. The furnace is lined with heavy refractory bricks to allow consistent heat retention and the hot air is re-circulated. The use of these refractories is important for once fired they glaze over to form a single unit. The hearth is solid and if the furnace were moved the refractory lining would crack and require replacement, also any brickwork is usually built up from a solid concrete base and thus the furnace cannot be moved from one site and re-erected in its original state on another - consequently most sizes will be rateable. This type of furnace may have been erected on top of a steel plate that sits on a concrete foundation. If this is so the likelihood is that the furnace can be moved and thus if under 400m3 would not be rateable.

Referencing details: -

Cost information notes: Includes refractory linings

Rateable element: Class 4 Table 4 Furnaces Note Class 4(d)

Non-rateable element: -

Adjusted plant and machinery: Foundations, pits, walkways and ducts

Number of items adjusted: The item can typically be found on an industrial complex. Some hereditaments may have multiple items, in which case the ERC needs to reflect the number of items.

Unit size: m3

Unit of measurement: m3

ERC: £4,839

Superseded codes: -

Location factor: Considered Not Applicable at time of Publication

Description: Heat Treatment Continuous Furnaces use heat to change the molecular composition of the metal. This treatment softens the metal and then it is cooled which hardens it again, this is controlled and adjusted depending on the desired end product. For the heating, temperatures can range between extremes of 420°C and 1800°C. The hot air is re-circulated within the furnace and the lining allows for consistent heat retention. The unit is usually long and has a pre heat zone, a controlled zone and a cooling zone. There is a continuous moving bed and the insulation is either refractory tiles or quilt. The unit often sits on a support frame (which is not part of the furnace). Although the zones may be capable of being individually replaced or moved around because much of the refractory lining once fired to glaze over forms a single unit if the furnace were moved the lining would crack and require replacement, so although the furnace can be readily moved it is unusual for this to be undertaken in its original state, therefore Class 4 (d) applies

Furnaces

CG Code: 209K01

Specific: Kilns (Brick)

Descriptive: Tunnel Kiln

Tech 1: 4229m3 (Gross External Volume)

Tech 2: -

Unit size: m3

Unit of measurement: m^3

ERC: £1,362

Superseded codes: -

Location factor: Considered Not Applicable at time of Publication

Description: Tunnel kilns. In a tunnel kiln or continuous kiln the dried un-fired bricks are passed through the kiln for firing in a continuous cycle on a kiln car set on tracks. The kiln takes the form of a long brick or metal tunnel on a reinforced foundation, incorporating a rail track on which the cars conveying the ware are propelled through the tunnel. The cars first pass through a pre-heating area, then through a firing zone, and are gradually cooled before emerging at the far end. Loaded cars awaiting entry to the kilns are run onto tracks parallel to it and are conveyed to the entry point on transfer plates. The same system being employed at the exit from the kiln where the bricks are left to await unstacking. Kilns are fuelled by either gas, oil, or electricity. In some cases within the firing zone bricks are exposed to an open flame; whereas in others the flame is muffled by a special heat conducting wall. Kilns are thus referred to as open flame or muffled flame. Operating temperatures depend on the bricks being produced but a typical a modern Lingl type kiln can reach temperatures of 1060°C. The whole essence of a brickworks turns on the continued efficiency of the kilns and efforts are always being made to keep the proportion of badly fired product down to a minimum. Therefore care is usually taken to keep the kiln at peak efficiency at all times by periodic renewal and repair. Properly maintained, the life of a kiln is considerable.

Referencing details: External volume of the kiln. Construction details.

Cost information notes: Cost includes flues and ducting, refractory linings, rail track set in the floor of the kiln / dryer and foundations. Ducting to the kiln is included based on the kiln being in relatively close proximity to the drier. Where they are separated by large distances then additional ducting may be included but this is a disability and should be compensated for by allowances - net effect may be neutral.

Rateable element: Class 4 Table 4 Kilns Note Class 4(d)

Tech 2: -

Unit size: m3

Unit of measurement: m^3

ERC: £883

Superseded codes: -

Location factor: Considered Not Applicable at time of Publication

Description: Drying units or driers work in concert with kilns. These are drying units which are needed to condition the green bricks before firing. Frequently found adjacent to the kilns in order that they can make use of the waste heat therefrom. The most common construction found is concrete blocks off a reinforced concrete foundation incorporating a rail track on which cars conveying the unfired bricks to the kilns are loaded. Normally a concrete slab or insulated steel sheeting ceiling.

Referencing details: External volume of the dryer. Construction details.

Cost information notes: Cost includes flues and ducting, refractory linings, rail track set in the floor of the kiln / dryer and foundations. Ducting to the kiln is included based on the kiln being in relatively close proximity to the drier. Tech 2: Volume 648m3

Unit size: -

Unit of measurement: m3

ERC: £3,531

Superseded codes: -

Location factor: Considered Not Applicable at time of Publication

Description: Annealing furnaces operate up to 750°C and then the product is cooled by a controlled release of heat. They can be very large and can have the hearth built on a platform bogie running on rails and moved via pulleys and cables. For smaller products the items are loaded into a fixed bed furnace using a mechanised furnace charger. For thin strip steel annealing (usually in a roll) it is undertaken in a continuous process and with the de-greasing lines these furnaces are often vertical. Annealing furnaces are not so dense in structure in respect of brickwork and refractories as they are not built to withstand or retain as much heat. The brickwork and ceramic tiles (sometimes fibre quilt) are not so expensive per m3 to purchase or install. Bogie furnaces are usually built up from the concrete base and thus even under size are unlikely to be capable of removal (Class 4(d)). The hearth is not rateable in these cases. Modern furnaces are built within a steel support frame

Description: Cabin Heaters are used in the chemical and petrochemical industry to heat crude oils to gaseous forms in order that fractions may be taken off in the adjacent fractionation column (for example both diesel and petroleum are fractions). The unit, made of carbon steel, is usually rectangular and sits around 2m above the ground in a complex structural steel support frame which also provides walkway and staircase access to different levels. There is also a chimney. Temperatures may reach up to 850°C (range 200°C - 850°C). The fuel used is often the gaseous waste produced by the process being undertaken. The upper temperatures are reached by use of a convection box. The heating chambers are usually constructed of refractory brickwork with heat resistant ceramic lined tiles. The oil is passed through pipes that lay in the firebox. In most cases the tubes can be removed and thus are not part of the structure. Cabin Heaters are usually over 400m3 but because those under may have difficulty in fulfilling the requirements of Class 4 (d) they would be rateable.

Referencing details: Rectangular heaters: measure the main unit externally but do not include the void area below the heater in the volume, note the age, note structural steel support details under and around the heater as well as stairways and walkways, note diameter and height of the chimney. Determine whether tubes can be removed (in the absence of definitive information assume they can be)

Cost information notes: Includes refractory linings. Add separately for i) foundations, ii) supporting steelwork, iii) chimney stack, iv) walkways and v) stairways

Rateable element: Class 4 Table 4 furnaces - stoves and ovens See Class 4(d)

Non-rateable element: if Class 4 (d) applies - tubes

Adjusted plant and machinery: Foundations, pits, walkways, ducts, stairways and supporting steelwork

Number of items adjusted: The item can typically be found on an industrial complex. Some hereditaments may have multiple items, in which case the ERC needs to reflect the number of items.

Contract size adjustment: See Appendix BEAMS Note 2

Description: This type of furnace heats blooms (ingots of steel) or part formed steel items that are taken in cold and heated in batches usually to a white heat (up to 1150°C) so that they can be worked (e.g. by rolling, squeezing, or drawing). This process either finishes the article or creates a product that is finished when cold (usually achieved by quenching in oil or water). This furnace usually has a single door that lifts upwards to allow full access to the furnace chamber. The process of re-heating is regulated to maintain the metal at a constant temperature to ensure that the product is cooked all the way through. Hot air is re-circulated within the furnace and it is lined with heavy refractory bricks to allow consistent heat retention, however, in other types ceramic tiles are used that when fired glaze over to form a solid lining but if the furnace were moved it would crack and require replacement. In older designs the brickwork is usually built up from a solid concrete base so the furnace cannot be moved from one site and re-erected in its original state on another (Class 4(d)) and consequently most sizes will be rateable. In newer designs the furnace is erected on a steel plate that sits on a concrete foundation above the shop floor, these can be moved so if it is 400m3 or less it would not be rateable.

Referencing details: Note if it has a metal plate under; the volume; its function i.e. re-heat; type and age; type of refractory lining :- brick, ceramic, quilt

Description: Annealing furnaces operate up to 750°C and then the product is cooled by a controlled release of heat. They can be very large and can have the hearth built on a platform bogie running on rails and moved via pulleys and cables. For smaller products the items are loaded into a fixed bed furnace using a mechanised furnace charger. For thin strip steel annealing (usually in a roll) it is undertaken in a continuous process and with the de-greasing lines these furnaces are often vertical. Annealing furnaces are not so dense in structure in respect of brickwork and refractories as they are not built to withstand or retain as much heat. The brickwork and ceramic tiles (sometimes fibre quilt) are not so expensive per m3 to purchase or install. Bogie furnaces are usually built up from the concrete base and thus even under size are unlikely to be capable of removal (Class 4(d)). The hearth is not rateable in these cases. Modern furnaces are built within a steel support frame

Description: The process of pre-heating is to enable the whole item to be raised from cold up to white hot (1350°C) more quickly than in other type of furnace so that when it is introduced to a soaking pit it does not cause a major temperature drop. Billets (say 50cm x 50cm x 2m) are normally produced in this process The hot air is re-circulated within the furnace and it is lined with heavy refractory bricks to allow consistent heat retention. It is important to note that refractories, once fired, glaze over to form a single unit so that if the furnace was moved the lining would be compromised and require replacement. The brickwork is usually built up from a solid concrete base so it cannot be moved from one site and re-erected in its original state on another (Class 4(d)). Consequently most sizes will be rateable. This type of furnace may have been erected on top of a steel plate that sits on a concrete foundation. If this is so the likelihood is that the furnace can be moved so if it is 400m3 or less then it would not be rateable

Location factor: Considered Not Applicable at time of Publication

Description: Hot Stoves look like a huge cigar case with a domed top and have a refractory lining. The stoves provide the hot blast air to Furnaces. The hot blast air is produced by passing cold blast air through the preheated ‘stoves’ and these heat the air to above 1000°C. Essentially, the stove is a vertical cylindrical steel shell lined with firebrick with the interior separated into two chambers: a combustion chamber, in which gases from the blast furnace and from other fuel sources such as the coking plant are burned, and a regenerative chamber filled with a checker work of refractory brick heated by the burned gas. The stove itself is heated by burning gas and combustion air within the chamber and the heat is then absorbed into the brickwork. This mode is called on-gas. When sufficient heat has been absorbed, the stove is put on-blast mode. At this point no combustion takes place but cold blast air is forced through the stove and absorbs the heat to become hot blast. This is then mixed with cold blast to bring it to the right temperature, and is then forced under pressure into the blast furnace (which causes the temperature to rise further). It is forced through pipes known as tyres and these are situated near its base. It is quite common to have three or four stoves, so that at any time one stove is on-blast while the others are on-gas or boxed. A boxed stove has been heated up to temperature and sealed, so that it is ready to go on-blast. If one stove is down for repair, it is possible to run on just two stoves instead

Referencing details: Cubic capacity

Cost information notes: Includes refractory linings.

Rateable element: Class 4 Table 4 furnaces - stoves and ovens See Class 4(d)

Gas Cleaning

CG Code: 210A01

Specific: Bag filters

Descriptive: Heavy duty - 10 compartments - 200 bags each

Tech 1: Filter house 5,400m³

Tech 2: Inc hoppers and steel support

Unit size: -

Unit of measurement: m3

ERC: £289

Superseded codes: -

Location factor: Considered Not Applicable at time of Publication

Description: Bag Filters - In operation this item of plant resembles a vacuum cleaner as dirty air is taken through material filters to remove fine particles of dust. Large versions of this item can be found in Steelworks, Cement works or Mineral extraction locations but smaller versions are now found in numerous industries where dirty air requires the removing of particles. In many cases, where specific machinery produces a very dirty air, a hood is installed, over the machine to specifically remove the polluted air. In other cases a hood in the roof of the building takes the dirty air from the building. The Bag filter fans produces a negative pressure in the hood and the dirty air is sucked via ducts to the main plant. The air is then sucked upwards through fine nylon bags and released to the atmosphere. For an electric arc furnace of 100 tonnes there would be some 2000 bags. The bags are situated in sections and they can be isolated and shaken and a reversed pressure can be introduced enabling the dust to fall to the bottom of the bag into a hopper. From here the dust is placed into bags via a conveyor system. The Bag Filter is usually situated on a steel support frame, there are steel hoppers under the bags and the whole plant sits on a concrete base.

Referencing details: Calculate external cubic volume of the item - note details of supports and foundations (to be costed separately).

Cost information notes: The Class 4 Table 4 rateable element (structural parts only) amount to 48% of the total cost.

Rateable element: In Class 1 = the entirety of the item. In Class 2 = unlikely to be rateable. In Class 3 = not rateable. In Class 4 = rateable to the extent of structural parts, if cubic capacity measured externally is 400 cubic metres or more, or if the item is not readily capable of being re-erected elsewhere per the Class 4 (d) proviso.

Non-rateable element: -

Adjusted plant and machinery: Ducts, flues, settings , supports, foundations, walkways and platforms.

Number of items adjusted: The item can typically be found on an industrial, commercial or office complex. Some hereditaments may have multiple items, in which case the ERC needs to reflect the number of items.

Contract size adjustment: See Appendix BEAMS Note 1

ERC: £12

Superseded codes: -

Location factor: Considered Not Applicable at time of Publication

Description: The precipitator uses electrical charge to remove dust particles from dusty air / gas.

Referencing details: Ascertain the external volume of the item. Note details of supports and foundations (to be costed separately)

Cost information notes: The main considerations are the volume of gas being cleaned, its temperature and its chemical composition.

Rateable element: In Class 1 = the entirety of the item. In Class 2 = unlikely to be rateable. In Class 3 = not rateable. In Class 4 = rateable to the extent of structural parts, if cubic capacity measured externally is 400 cubic metres or more, or if the item is not readily capable of being re-erected elsewhere per the Class 4 (d) proviso.

Non-rateable element: -

Adjusted plant and machinery: Ducts, flues, walkways

Number of items adjusted: The item can typically be found on an industrial, commercial or office complex. Some hereditaments may have multiple items, in which case the ERC needs to reflect the number of items.

Contract size adjustment: See Appendix BEAMS Note 1

Variations: -

Gas Cleaning

CG Code: 210F05

Specific: Ducting - circular

Descriptive: Circular Ducts - Refractories / ceramic linings

Tech 1: Addition for lining

Tech 2: 1.0m dia

Unit size: -

Unit of measurement: m

ERC: £341

Superseded codes: -

Location factor: Considered Not Applicable at time of Publication

Description: The cost represents an addition to the basic duct price to reflect the addition of a ceramic or refractory lining to the duct. Cost is £ per linear metre of duct

Referencing details: Width and height or diameter and length.

Cost information notes: -

Rateable element: Class 4 Table 3 Ducts will be rateable if they are in the nature of a structure. Common practice is to consider any duct under 300 mm diameter as being unlikely to meet the ‘structure’ test.

Non-rateable element: Pipes and ducts under 300 mm diameter

Adjusted plant and machinery: -

Number of items adjusted: -

Contract size adjustment: See Appendix BEAMS Note 1

Variations: -

Gas Cleaning

CG Code: 210E01

Specific: Ducting

Descriptive: Square or Rectangular, basic duct.

Tech 1: Mild steel - 8mm thick - with external steel frame support

Tech 2: Size 4m x 5m

Unit size: Linear metre

Unit of measurement: m

ERC: £11,255

Superseded codes: -

Location factor: Considered Not Applicable at time of Publication

Description: Ducts are found in industrial premises where large quantities of gases (often hot) require to be taken from the point of combustion to some form of gas cleaning equipment. i.e. Bag filter plant, electrostatic precipitator, or cyclone. Industries usually having gas-cleaning facilities include steelworks and cement works. Smaller operations also have ducting either near engines or to transport products round the property. There are two basic types: (1) Square / rectangular section (2) Tube. The duct is usually welded (bolted and sealed) as often an induced draught fan is employed to form a negative pressure, which draws the fumes (product) towards it and through the cleaning equipment. Where the fumes are very hot or abrasive the initial section of the ducts is refractory lined. The duct from the cleaning equipment to the chimney is not usually lined. Ducts gain support from factory buildings and machines but often have trestle supports or steel racks on which they rest especially if they are at high level and cover a long distance when elevated. Cost does not include any supports.

Referencing details: External dimensions of duct and length of duct.

Cost information notes: -

Rateable element: Class 4 Table 3 Ducts will be rateable if they are in the nature of a structure. Common practice is to consider any duct under 300 mm diameter as being unlikely to meet the ‘structure’ test.

Where the fumes are very hot or abrasive the initial section of the ducts is refractory lined. The duct from the cleaning equipment to the chimney is not usually lined. Ducts gain support from factory buildings and machines but often have trestle supports or steel racks on which they rest especially if they are at high level and cover a long distance when elevated. Cost does not include any supports.

Referencing details: External dimensions of duct and x length in metres.

Cost information notes: -

Rateable element: Class 4 Table 3 Ducts will be rateable if they are in the nature of a structure. Common practice is to consider any duct under 300 mm diameter as being unlikely to meet the ‘structure’ test.

Non-rateable element: Pipes and ducts under 300 mm diameter

Adjusted plant and machinery: -

Number of items adjusted: -

Contract size adjustment: See Appendix BEAMS Note 1

Variations: -

Gas Cleaning

CG Code: 210F06

Specific: Ducting - circular

Descriptive: Circular Ducts - Refractories / ceramic linings

Tech 1: Addition for lining

Tech 2: 1.5m dia

Unit size: -

Unit of measurement: m

ERC: £518

Superseded codes: -

Location factor: Considered Not Applicable at time of Publication

Description: The cost represents an addition to the basic duct price to reflect the addition of a ceramic or refractory lining to the duct. Cost is £ per linear metre of duct

Referencing details: Width and height or diameter and length.

Cost information notes: -

Rateable element: Class 4 Table 3 Ducts will be rateable if they are in the nature of a structure. Common practice is to consider any duct under 300 mm diameter as being unlikely to meet the ‘structure’ test.

Gas Cleaning

CG Code: 210F30

Specific: Ducts - Circular or Square Section

Descriptive: Heavy duty applications - Cement works

Tech 1: 0.75m square section

Tech 2: Welded and flanged with bolted connections

Unit size: Linear metre

Unit of measurement: m

ERC: £900

Superseded codes: -

Location factor: Considered Not Applicable at time of Publication

Description: Ducts are found in industrial premises where large quantities of gases (often hot) require to be taken from the point of combustion to some form of gas cleaning equipment. i.e. Bag filter plant, electrostatic precipitator, or cyclone. Industries usually having gas-cleaning facilities include steelworks and cement works. Smaller operations also have ducting either near engines or to transport products round the property. There are two basic types: (1) Square / rectangular section (2) Tube. The duct is usually welded (bolted and sealed) as often an induced draught fan is employed to form a negative pressure, which draws the fumes (product) towards it and through the cleaning equipment. Where the fumes are very hot or abrasive the initial section of the ducts is refractory lined. The duct from the cleaning equipment to the chimney is not usually lined. Ducts gain support from factory buildings and machines but often have trestle supports or steel racks on which they rest especially if they are at high level and cover a long distance when elevated. Cost does not include any supports.

Referencing details: External dimensions of duct and length of duct. (width x height x length)

Cost information notes: The ERC is calculated on the basis of the total surface area of ducting in m2.

Rateable element: Class 4 Table 3 Ducts will be rateable if they are in the nature of a structure. Common practice is to consider any duct under 300 mm diameter as being unlikely to meet the ‘structure’ test.

Non-rateable element: Pipes and ducts under 300 mm diameter

Adjusted plant and machinery: -

Number of items adjusted: -

Contract size adjustment: See Appendix BEAMS Note 1

Variations: If the ducting system has size changes (size reduction / increase) then add 35% to the cost.

HM Revenue & Customs | Valuation Office

Gatehouse Weighbridge Building

CG Code: 425005

Specific: Single Storey

Descriptive: Less than 10m2

Tech 1: -

Tech 2: -

Unit size: -

Unit of measurement: m2

ERC: £1,368

Superseded codes: -

Location factor: Location Adjustment Applicable (See Guidance Notes) - ERC = UK mean of 1.00

Description: The building is assumed to be single storey of traditional form of construction, brick cladding and varying heights. An average size is adopted based on the size ranges given with an assumed rectangular floor plate. All buildings are assumed to have a pitched roof profile with lighting and power only allowed as Mechanical & Electrical services.

Referencing details: Measure to GIA

Cost information notes: For glass reinforced plastic see Portable Buildings. Often houses CCTV equipment and monitors- for costs see Security and Alarm Systems

Rateable element: -

Non-rateable element: -

Adjusted plant and machinery: -

Number of items adjusted: -

Contract size adjustment: See Appendix BEAMS Note 2

Description: Sliding cantilevered security gate- remote electronic operation, close vertical bars within steel frame. Size 3m high x 7m wide. Includes support posts, sliding track, locking mechanisms and all electrics (motors and controls) for automation.

Referencing details: Measure between support posts

Cost information notes: Includes support posts, sliding track, locking mechanisms and electronic motors and controls

Rateable element: -

Non-rateable element: -

Adjusted plant and machinery: CCTV, security equipment, fencing and external works

Number of items adjusted: -

Contract size adjustment: See Appendix BEAMS Note 2

Variations: -

Gates

CG Code: 33UTS1

Specific: Metal

Descriptive: Security turnstile

Tech 1: With cage - 2.3m ht

Tech 2: Mechanical ; Stainless steel or galvanised

Unit size: Each

Unit of measurement: Each

ERC: £6,390

Superseded codes: -

Location factor: Location Adjustment Applicable (See Guidance Notes) - ERC = UK mean of 1.00

Description: Gates -Security turnstile - Mechanical - With cage - 2.3m ht Stainless steel or galvanised – Painted. Cost includes supply and installation with push button panel.

Referencing details: Note height, age and operation. Electronic controls or manual.

Cost information notes: -

Rateable element: -

Non-rateable element: -

Adjusted plant and machinery: CCTV, security equipment, fencing and external works

Hoists

CG Code: 211C31

Specific: Wire rope

Descriptive: Hoist speed 16m per minute

Tech 1: Lift height 22m

Tech 2: Max lifting weight 1.0 tonne

Unit size: -

Unit of measurement: Each

ERC: £9,469

Superseded codes: -

Location factor: Considered Not Applicable at time of Publication

Description: Hoists come in several formations and generally they are regarded as the mechanical part of lifting apparatus. An engine with a drum used for winding up a load, tackle for raising goods. For over-head hoists, where they operate within twin support beams, which move up and down a shop floor, the whole unit is more correctly described as a moving traveller and should be rated accordingly. Where, however, the engine and drum move along a simple beam, this can be correctly described as a hoist. Hoist lifting platforms within cages (shafts) i.e. Dumb Waiters and goods part lifts are lightweight forms of lifts. Goods/Passenger hoists with wire cages are usually found in industrial premises. The Electric wire rope hoist has a heavy duty wire rope wound onto a drum and attached to a hook, powered by an electric motor to raise and lower objects.

Referencing details: Speeds across the main beam and lifting speeds may be single or multiple. The lifting attachment may be chain or wire rope. NOTE: weight limit and height of lift.

Cost information notes: The motor and cable drum plus the manual controls have been included in the cost

Rateable element: A hoist is rateable under Class 3(b). There are no limitations on size; whether the item is a structure or what can be included. It is assumed that the supporting beam is additional to the cost of the hoist and should be rated under Class 4 Table 3 supports.

Non-rateable element: -

Adjusted plant and machinery: -

Location factor: Considered Not Applicable at time of Publication

Description: Hoists come in several formations and generally they are regarded as the mechanical part of lifting apparatus. An engine with a drum used for winding up a load, tackle for raising goods. For over-head hoists, where they operate within twin support beams, which move up and down a shop floor, the whole unit is more correctly described as a moving traveller and should be rated accordingly. Where, however, the engine and drum move along a simple beam, this can be correctly described as a hoist. Hoist lifting platforms within cages (shafts) i.e. Dumb Waiters and goods part lifts are lightweight forms of lifts. Goods/Passenger hoists with wire cages are usually found in industrial premises. The Electric wire rope hoist has a heavy duty wire rope wound onto a drum and attached to a hook, powered by an electric motor to raise and lower objects.

Referencing details: Speeds across the main beam and lifting speeds may be single or multiple. The lifting attachment may be chain or wire rope. NOTE: weight limit and height of lift.

Cost information notes: The motor and cable drum plus the manual controls have been included in the cost

Rateable element: A hoist is rateable under Class 3(b). There are no limitations on size; whether the item is a structure or what can be included. It is assumed that the supporting beam is additional to the cost of the hoist and should be rated under Class 4 Table 3 supports.

Description: A private hospital is a hospital owned and operated by an organisation other than the state, whether for-profit or a non-profit, and privately funded through payment for medical services by patients themselves, by insurers, governments through national health insurance programs, or by foreign embassies. The term is mainly used in the United Kingdom where private hospitals are distinguished from NHS institutions.

Hydraulic pumps

CG Code: 212P100

Specific: Pump set

Descriptive: 75kW

Tech 1: kW rating of main motor

Tech 2: -

Unit size: Per Kw

Unit of measurement: kW

ERC: £1,178

Superseded codes: 212P26

Location factor: Considered Not Applicable at time of Publication

Description: A typical hydraulic pump set sits on a skid and has a reservoir for hydraulic fluid, there are usually 3 motor / pump units each one capable of producing the power required. The set will have manifolds and valves and is generally positioned near the machinery using the hydraulic power. The maximum pressure for this type of set would be 350 bar, although typically 145 to 250 bar is more commonly found as normal working pressure. The guide cost represents a set with 3 main motors and these may either be used individually or run together. A set can have 2 smaller motor pumps for circulating coolant through the reservoir and assist in circulating the pressurised hydraulic fluid through the system. The pipes on the skid, electrical controls, computer equipment along with a nominal amount for any accumulators and any pipework connecting the set to the hydraulically operated plant.

Referencing details: Cost is for a set and include an accumulator and pipework to the hydraulically operated machinery. Cost includes additions for delivery, installation and commissioning.. Costs nominally include two smaller motor / pumps which are for circulating the coolant and drawing back the hydraulic fluid into the main reservoir. Motors are 415 v 50Hz @ nominal 1,450 rpm, pressures up to 350 bar

Cost information notes: The cost is per kW of motor power and the power of the largest main motor should be recorded. It is not necessary, to add together the kW of any additional motors.

Rateable element: Main Transmission of Power Class 1 Table 1(h) Pumping engines for hydraulic power List of Accessories (viii) instrumentation. Hydraulics used for Power purposes - Class 1 Table 1(h) Class 1 Table 1(l) List of Accessories 2 (i) to (viii)

Non-rateable element: -

Adjusted plant and machinery: Foundations, Settings, Pits. Pipes - main supply pipes The transmission of power through the pipes is an essential part of the operation being

undertaken and the pipes are specifically constructed to minimise power loss through their length. They are required to be flexible enough to prevent joints, yet be capable of maintaining the pressure required. The end couplings have to be sealed to the pipe and be of specific specification to be capable of withholding pressure.

Number of items adjusted: The item can typically be found on an industrial, commercial or office complex. Some hereditaments may have multiple items, in which case the ERC needs to reflect the number of items.

Contract size adjustment: See Appendix BEAMS Note 1

Location factor: Considered Not Applicable at time of Publication

Description: Usually a square or rectangular tank or container, approximately 4m x 4m foot print and up to a height of about 15m. The container makes its own ice chips and supplies via conveyor this ice to containers holding freshly caught fish off loaded from fishing boats. Associated plant and machinery includes water tank, chiller/freezer units

Indoor bowls centre

CG Code: STS019

Specific: Single Storey

Descriptive: Indoor bowling centre

Tech 1: -

Tech 2: -

Unit size: -

Unit of measurement: m2

ERC: £1,496

Superseded codes: -

Location factor: Location Adjustment Applicable (See Guidance Notes) - ERC = UK mean of 1.00

Description: Specification - 6 rink bowls hall, changing rooms, toilets, kitchen, kitchen store, dining area, lounge, bar, bar store, committee room, office, cleaners' store and plant room. Structural steel frame. Cedar clad external walls and profiled metal clad roof.

Referencing details: -

Industrial Buildings

CG Code: 41P85Q

Specific: Insulated Buildings

Descriptive: Sheet Metal Cladding

Tech 1: 1,001 - 5,000m2

Tech 2: Eaves Height - 16m

Unit size: -

Unit of measurement: m2

ERC: £715

Superseded codes: -

Location factor: Location Adjustment Applicable (See Guidance Notes) - ERC = UK mean of 1.00

Description: Building Area only; Site strip vegetation; Strip foundations; Column bases; Insulated Concrete GF slab with DPM and Mesh,150mm thick up to 10,000m2, 200mm thick over 10,000m2 GIA; Steel Portal frame with bolts and baseplates; Coated galvanised trapezoidal roof sheets with insulation on steel purlins; Roof lights; valley gutters; matching fascia and soffit; Rainwater downpipes and gutters; trapezoidal insulated wall system cladding on cladding rails; External roller shutter doors and personnel doors; Single phase electrics, lighting and power; Gas fuelled hot air burners; Under slab storm drainage from internal downpipes on building area greater than 1,000m2;

Referencing details: -

Cost information notes: The data consists of a typical Industrial shell. Works include the Industrial shell as described and includes works up to 1m perimeter to the building (1m wide paving slabs & foul/storm drainage), The cost include 2 no. personnel doors and roller shutters are included at 1 door up to 1,000m2 , 2 roller doors over 1,000m2 (GIA), and 4 roller doors over 5,000m2. Costs are for the shell only and do not include for internal rooms such as offices or toilets which should be added for separately. See Variations for assistance.

Location factor: Location Adjustment Applicable (See Guidance Notes) - ERC = UK mean of 1.00

Description: Building Area only; Site strip vegetation; Strip foundations; Column bases; Insulated Concrete GF slab with DPM and Mesh,150mm thick up to 10,000m2, 200mm thick over 10,000m2 GIA; Steel Portal frame with bolts and baseplates; Coated galvanised trapezoidal roof sheets with no insulation, on steel purlins; Roof lights; valley gutters; matching fascia and soffit; Rainwater downpipes and gutters; trapezoidal uninsulated wall system cladding on cladding rails; External roller shutter doors and personnel doors; Single phase electrics, lighting and power ; EXCLUDES heating ; Under slab storm drainage from internal downpipes on building area greater than 1,000m2

Referencing details: -

Cost information notes: The data consists of a typical Industrial shell. Works include the Industrial shell as described and includes works up to 1m perimeter to the building (1m wide paving slabs & foul/storm drainage), The cost include 2 no. personnel doors and roller shutters are included at 1 door up to 1,000m2 , 2 roller doors over 1,000m2 (GIA), and 4 roller doors over 5,000m2. Costs are for the shell only and do not include for internal rooms such as offices or toilets which should be added for separately. See Variations for assistance.

Rateable element: -

Non-rateable element: -

Adjusted plant and machinery: -

Number of items adjusted: -

Contract size adjustment: See Appendix BEAMS Note 2

Variations: If Cavity Wall construction to lower walls then measure relevant wall area and use code 41P1V1, single block walls are cost neutral. Additional roller shutter doors over and above the beacon specification should be added using code 41P1V2 . Additional personnel doors over the assumed 2no. - add Code 41P1V3. If heating is required an addition using code 41P1V4 (GIA) should be made to the beacon cost. Internal offices (in Industrial complexes) should be added by reference to Cost Guide code series 42P04A - 42P40V, Internal WC - 42P40W

Description: Building Area only; Site strip vegetation; Strip foundations; Column bases; Insulated Concrete GF slab with DPM and Mesh,150mm thick up to 10,000m2, 200mm thick over 10,000m2 GIA; Steel Portal frame with bolts and baseplates; Coated galvanised trapezoidal roof sheets with insulation on steel purlins; Roof lights; valley gutters; matching fascia and soffit; Rainwater downpipes and gutters; trapezoidal insulated wall system cladding on cladding rails; External roller shutter doors and personnel doors; Single phase electrics, lighting and power; Gas fuelled hot air burners; Under slab storm drainage from internal downpipes on building area greater than 1,000m2;

Referencing details: -

Cost information notes: The data consists of a typical Industrial shell. Works include the Industrial shell as described and includes works up to 1m perimeter to the building (1m wide paving slabs & foul/storm drainage), The cost include 2 no. personnel doors and roller shutters are included at 1 door up to 1,000m2 , 2 roller doors over 1,000m2 (GIA), and 4 roller doors over 5,000m2. Costs are for the shell only and do not include for internal rooms such as offices or toilets which should be added for separately. See Variations for assistance.

Rateable element: -

Non-rateable element: -

Adjusted plant and machinery: -

Number of items adjusted: -

Contract size adjustment: See Appendix BEAMS Note 2

Variations: If Cavity Wall construction to lower walls then measure relevant wall area and use code 41P1V1, single block walls are cost neutral. Additional roller shutter doors over and above the beacon specification should be added using code 41P1V2 . Additional personnel doors over the assumed 2no. - add Code 41P1V3. If heating is required an addition using code 41P1V4 (GIA) should be made to the beacon cost. Internal offices (in Industrial complexes) should be added by reference to Cost Guide code series 42P04A - 42P40V, Internal WC - 42P40W

Description: Building Area only; Site strip vegetation; Strip foundations; Column bases; Insulated Concrete GF slab with DPM and Mesh,150mm thick up to 10,000m2, 200mm thick over 10,000m2 GIA; Steel Portal frame with bolts and baseplates; Coated galvanised trapezoidal roof sheets with insulation on steel purlins; Roof lights; valley gutters; matching fascia and soffit; Rainwater downpipes and gutters; trapezoidal insulated wall system cladding on cladding rails; External roller shutter doors and personnel doors; Single phase electrics, lighting and power; Gas fuelled hot air burners; Under slab storm drainage from internal downpipes on building area greater than 1,000m2;

Referencing details: -

Cost information notes: The data consists of a typical Industrial shell. Works include the Industrial shell as described and includes works up to 1m perimeter to the building (1m wide paving slabs & foul/storm drainage), The cost include 2 no. personnel doors and roller shutters are included at 1 door up to 1,000m2 , 2 roller doors over 1,000m2 (GIA), and 4 roller doors over 5,000m2. Costs are for the shell only and do not include for internal rooms such as offices or toilets which should be added for separately. See Variations for assistance.

Rateable element: -

Non-rateable element: -

Adjusted plant and machinery: -

Number of items adjusted: -

Contract size adjustment: See Appendix BEAMS Note 2

Variations: If Cavity Wall construction to lower walls then measure relevant wall area and use code 41P1V1, single block walls are cost neutral. Additional roller shutter doors over and above the beacon specification should be added using code 41P1V2 . Additional personnel doors over the assumed 2no. - add Code 41P1V3. If heating is required an addition using code 41P1V4 (GIA) should be made to the beacon cost. Internal offices (in Industrial complexes) should be added by reference to Cost Guide code series 42P04A - 42P40V, Internal WC - 42P40W

Superseded codes: 41P84M

Location factor: Location Adjustment Applicable (See Guidance Notes) - ERC = UK mean of 1.00

Description: Building Area only; Site strip vegetation; Strip foundations; Column bases; Insulated Concrete GF slab with DPM and Mesh,150mm thick up to 10,000m2, 200mm thick over 10,000m2 GIA; Steel Portal frame with bolts and baseplates; Coated galvanised trapezoidal roof sheets with insulation on steel purlins; Roof lights; valley gutters; matching fascia and soffit; Rainwater downpipes and gutters; trapezoidal insulated wall system cladding on cladding rails; External roller shutter doors and personnel doors; Single phase electrics, lighting and power; Gas fuelled hot air burners; Under slab storm drainage from internal downpipes on building area greater than 1,000m2;

Referencing details: -

Cost information notes: The data consists of a typical Industrial shell. Works include the Industrial shell as described and includes works up to 1m perimeter to the building (1m wide paving slabs & foul/storm drainage), The cost include 2 no. personnel doors and roller shutters are included at 1 door up to 1,000m2 , 2 roller doors over 1,000m2 (GIA), and 4 roller doors over 5,000m2. Costs are for the shell only and do not include for internal rooms such as offices or toilets which should be added for separately. See Variations for assistance.

Rateable element: -

Non-rateable element: -

Adjusted plant and machinery: -

Number of items adjusted: -

Contract size adjustment: See Appendix BEAMS Note 2

Variations: If Cavity Wall construction to lower walls then measure relevant wall area and use code 41P1V1, single block walls are cost neutral. Additional roller shutter doors over and above the beacon specification should be added using code 41P1V2 . Additional personnel doors over the assumed 2no. - add Code 41P1V3. If heating is required an addition using code 41P1V4 (GIA) should be made to the beacon cost. Internal offices (in Industrial complexes) should be added by reference to Cost Guide code series 42P04A - 42P40V, Internal WC - 42P40W

Location factor: Location Adjustment Applicable (See Guidance Notes) - ERC = UK mean of 1.00

Description: Building Area only; Site strip vegetation; Strip foundations; Column bases; Insulated Concrete GF slab with DPM and Mesh,150mm thick up to 10,000m2, 200mm thick over 10,000m2 GIA; Steel Portal frame with bolts and baseplates; Coated galvanised trapezoidal roof sheets with insulation on steel purlins; Roof lights; valley gutters; matching fascia and soffit; Rainwater downpipes and gutters; trapezoidal insulated wall system cladding on cladding rails; External roller shutter doors and personnel doors; Single phase electrics, lighting and power; Gas fuelled hot air burners; Under slab storm drainage from internal downpipes on building area greater than 1,000m2;

Referencing details: -

Cost information notes: The data consists of a typical Industrial shell. Works include the Industrial shell as described and includes works up to 1m perimeter to the building (1m wide paving slabs & foul/storm drainage), The cost include 2 no. personnel doors and roller shutters are included at 1 door up to 1,000m2 , 2 roller doors over 1,000m2 (GIA), and 4 roller doors over 5,000m2. Costs are for the shell only and do not include for internal rooms such as offices or toilets which should be added for separately. See Variations for assistance.

Rateable element: -

Non-rateable element: -

Adjusted plant and machinery: -

Number of items adjusted: -

Contract size adjustment: See Appendix BEAMS Note 2

Variations: If Cavity Wall construction to lower walls then measure relevant wall area and use code 41P1V1, single block walls are cost neutral. Additional roller shutter doors over and above the beacon specification should be added using code 41P1V2 . Additional personnel doors over the assumed 2no. - add Code 41P1V3. If heating is required an addition using code 41P1V4 (GIA) should be made to the beacon cost. Internal offices (in Industrial complexes) should be added by reference to Cost Guide code series 42P04A - 42P40V, Internal WC - 42P40W

Location factor: Location Adjustment Applicable (See Guidance Notes) - ERC = UK mean of 1.00

Description: Building Area only; Site strip vegetation; Strip foundations; Column bases; Insulated Concrete GF slab with DPM and Mesh,150mm thick up to 10,000m2, 200mm thick over 10,000m2 GIA; Steel Portal frame with bolts and baseplates; Coated galvanised trapezoidal roof sheets with insulation on steel purlins; Roof lights; valley gutters; matching fascia and soffit; Rainwater downpipes and gutters; trapezoidal insulated wall system cladding on cladding rails; External roller shutter doors and personnel doors; Single phase electrics, lighting and power; Gas fuelled hot air burners; Under slab storm drainage from internal downpipes on building area greater than 1,000m2;

Referencing details: -

Cost information notes: The data consists of a typical Industrial shell. Works include the Industrial shell as described and includes works up to 1m perimeter to the building (1m wide paving slabs & foul/storm drainage), The cost include 2 no. personnel doors and roller shutters are included at 1 door up to 1,000m2 , 2 roller doors over 1,000m2 (GIA), and 4 roller doors over 5,000m2. Costs are for the shell only and do not include for internal rooms such as offices or toilets which should be added for separately. See Variations for assistance.

Rateable element: -

Non-rateable element: -

Adjusted plant and machinery: -

Number of items adjusted: -

Contract size adjustment: See Appendix BEAMS Note 2

Variations: If Cavity Wall construction to lower walls then measure relevant wall area and use code 41P1V1, single block walls are cost neutral. Additional roller shutter doors over and above the beacon specification should be added using code 41P1V2 . Additional personnel doors over the assumed 2no. - add Code 41P1V3. If heating is required an addition using code 41P1V4 (GIA) should be made to the beacon cost. Internal offices (in Industrial complexes) should be added by reference to Cost Guide code series 42P04A - 42P40V, Internal WC - 42P40W

Description: Building Area only; Site strip vegetation; Strip foundations; Column bases; Insulated Concrete GF slab with DPM and Mesh,150mm thick up to 10,000m2, 200mm thick over 10,000m2 GIA; Steel Portal frame with bolts and baseplates; Coated galvanised trapezoidal roof sheets with insulation on steel purlins; Roof lights; valley gutters; matching fascia and soffit; Rainwater downpipes and gutters; trapezoidal insulated wall system cladding on cladding rails; External roller shutter doors and personnel doors; Single phase electrics, lighting and power; Gas fuelled hot air burners; Under slab storm drainage from internal downpipes on building area greater than 1,000m2;

Referencing details: -

Cost information notes: The data consists of a typical Industrial shell. Works include the Industrial shell as described and includes works up to 1m perimeter to the building (1m wide paving slabs & foul/storm drainage), The cost include 2 no. personnel doors and roller shutters are included at 1 door up to 1,000m2 , 2 roller doors over 1,000m2 (GIA), and 4 roller doors over 5,000m2. Costs are for the shell only and do not include for internal rooms such as offices or toilets which should be added for separately. See Variations for assistance.

Rateable element: -

Non-rateable element: -

Adjusted plant and machinery: -

Number of items adjusted: -

Contract size adjustment: See Appendix BEAMS Note 2

Variations: If Cavity Wall construction to lower walls then measure relevant wall area and use code 41P1V1, single block walls are cost neutral. Additional roller shutter doors over and above the beacon specification should be added using code 41P1V2 . Additional personnel doors over the assumed 2no. - add Code 41P1V3. If heating is required an addition using code 41P1V4 (GIA) should be made to the beacon cost. Internal offices (in Industrial complexes) should be added by reference to Cost Guide code series 42P04A - 42P40V, Internal WC - 42P40W

Description: Building Area only; Site strip vegetation; Strip foundations; Column bases; Insulated Concrete GF slab with DPM and Mesh,150mm thick up to 10,000m2, 200mm thick over 10,000m2 GIA; Steel Portal frame with bolts and baseplates; Coated galvanised trapezoidal roof sheets with insulation on steel purlins; Roof lights; valley gutters; matching fascia and soffit; Rainwater downpipes and gutters; trapezoidal insulated wall system cladding on cladding rails; External roller shutter doors and personnel doors; Single phase electrics, lighting and power; Gas fuelled hot air burners; Under slab storm drainage from internal downpipes on building area greater than 1,000m2;

Referencing details: -

Cost information notes: The data consists of a typical Industrial shell. Works include the Industrial shell as described and includes works up to 1m perimeter to the building (1m wide paving slabs & foul/storm drainage), The cost include 2 no. personnel doors and roller shutters are included at 1 door up to 1,000m2 , 2 roller doors over 1,000m2 (GIA), and 4 roller doors over 5,000m2. Costs are for the shell only and do not include for internal rooms such as offices or toilets which should be added for separately. See Variations for assistance.

Rateable element: -

Non-rateable element: -

Adjusted plant and machinery: -

Number of items adjusted: -

Contract size adjustment: See Appendix BEAMS Note 2

Variations: If Cavity Wall construction to lower walls then measure relevant wall area and use code 41P1V1, single block walls are cost neutral. Additional roller shutter doors over and above the beacon specification should be added using code 41P1V2 . Additional personnel doors over the assumed 2no. - add Code 41P1V3. If heating is required an addition using code 41P1V4 (GIA) should be made to the beacon cost. Internal offices (in Industrial complexes) should be added by reference to Cost Guide code series 42P04A - 42P40V, Internal WC - 42P40W

ERC: £1,505

Superseded codes: 41P397

Location factor: Location Adjustment Applicable (See Guidance Notes) - ERC = UK mean of 1.00

Description: Building Area only; Site strip vegetation; Strip foundations; Column bases; Insulated Concrete GF slab with DPM and Mesh,150mm thick up to 10,000m2, 200mm thick over 10,000m2 GIA; Steel Portal frame with bolts and baseplates; Coated galvanised trapezoidal roof sheets with insulation on steel purlins; Roof lights; valley gutters; matching fascia and soffit; Rainwater downpipes and gutters; trapezoidal insulated wall system cladding on cladding rails; External roller shutter doors and personnel doors; Single phase electrics, lighting and power; Gas fuelled hot air burners; Under slab storm drainage from internal downpipes on building area greater than 1,000m2;

Referencing details: -

Cost information notes: The data consists of a typical Industrial shell. Works include the Industrial shell as described and includes works up to 1m perimeter to the building (1m wide paving slabs & foul/storm drainage), The cost include 2 no. personnel doors and roller shutters are included at 1 door up to 1,000m2 , 2 roller doors over 1,000m2 (GIA), and 4 roller doors over 5,000m2. Costs are for the shell only and do not include for internal rooms such as offices or toilets which should be added for separately. See Variations for assistance.

Rateable element: -

Non-rateable element: -

Adjusted plant and machinery: -

Number of items adjusted: -

Contract size adjustment: See Appendix BEAMS Note 2

Variations: If Cavity Wall construction to lower walls then measure relevant wall area and use code 41P1V1, single block walls are cost neutral. Additional roller shutter doors over and above the beacon specification should be added using code 41P1V2 . Additional personnel doors over the assumed 2no. - add Code 41P1V3. If heating is required an addition using code 41P1V4 (GIA) should be made to the beacon cost. Internal offices (in Industrial complexes) should be added by reference to Cost Guide code series 42P04A - 42P40V, Internal WC - 42P40W

Superseded codes: 41P32R

Location factor: Location Adjustment Applicable (See Guidance Notes) - ERC = UK mean of 1.00

Description: Building Area only; Site strip vegetation; Strip foundations; Column bases; Insulated Concrete GF slab with DPM and Mesh,150mm thick up to 10,000m2, 200mm thick over 10,000m2 GIA; Steel Portal frame with bolts and baseplates; Coated galvanised trapezoidal roof sheets with insulation on steel purlins; Roof lights; valley gutters; matching fascia and soffit; Rainwater downpipes and gutters; trapezoidal insulated wall system cladding on cladding rails; External roller shutter doors and personnel doors; Single phase electrics, lighting and power; Gas fuelled hot air burners; Under slab storm drainage from internal downpipes on building area greater than 1,000m2;

Referencing details: -

Cost information notes: The data consists of a typical Industrial shell. Works include the Industrial shell as described and includes works up to 1m perimeter to the building (1m wide paving slabs & foul/storm drainage), The cost include 2 no. personnel doors and roller shutters are included at 1 door up to 1,000m2 , 2 roller doors over 1,000m2 (GIA), and 4 roller doors over 5,000m2. Costs are for the shell only and do not include for internal rooms such as offices or toilets which should be added for separately. See Variations for assistance.

Rateable element: -

Non-rateable element: -

Adjusted plant and machinery: -

Number of items adjusted: -

Contract size adjustment: See Appendix BEAMS Note 2

Variations: If Cavity Wall construction to lower walls then measure relevant wall area and use code 41P1V1, single block walls are cost neutral. Additional roller shutter doors over and above the beacon specification should be added using code 41P1V2 . Additional personnel doors over the assumed 2no. - add Code 41P1V3. If heating is required an addition using code 41P1V4 (GIA) should be made to the beacon cost. Internal offices (in Industrial complexes) should be added by reference to Cost Guide code series 42P04A - 42P40V, Internal WC - 42P40W

Superseded codes: 41P411

Location factor: Location Adjustment Applicable (See Guidance Notes) - ERC = UK mean of 1.00

Description: Building Area only; Site strip vegetation; Strip foundations; Column bases; Insulated Concrete GF slab with DPM and Mesh,150mm thick up to 10,000m2, 200mm thick over 10,000m2 GIA; Steel Portal frame with bolts and baseplates; Coated galvanised trapezoidal roof sheets with insulation on steel purlins; Roof lights; valley gutters; matching fascia and soffit; Rainwater downpipes and gutters; trapezoidal insulated wall system cladding on cladding rails; External roller shutter doors and personnel doors; Single phase electrics, lighting and power; Gas fuelled hot air burners; Under slab storm drainage from internal downpipes on building area greater than 1,000m2;

Referencing details: -

Cost information notes: The data consists of a typical Industrial shell. Works include the Industrial shell as described and includes works up to 1m perimeter to the building (1m wide paving slabs & foul/storm drainage), The cost include 2 no. personnel doors and roller shutters are included at 1 door up to 1,000m2 , 2 roller doors over 1,000m2 (GIA), and 4 roller doors over 5,000m2. Costs are for the shell only and do not include for internal rooms such as offices or toilets which should be added for separately. See Variations for assistance.

Rateable element: -

Non-rateable element: -

Adjusted plant and machinery: -

Number of items adjusted: -

Contract size adjustment: See Appendix BEAMS Note 2

Variations: If Cavity Wall construction to lower walls then measure relevant wall area and use code 41P1V1, single block walls are cost neutral. Additional roller shutter doors over and above the beacon specification should be added using code 41P1V2 . Additional personnel doors over the assumed 2no. - add Code 41P1V3. If heating is required an addition using code 41P1V4 (GIA) should be made to the beacon cost. Internal offices (in Industrial complexes) should be added by reference to Cost Guide code series 42P04A - 42P40V, Internal WC - 42P40W

Description: Building Area only; Site strip vegetation; Strip foundations; Column bases; Insulated Concrete GF slab with DPM and Mesh,150mm thick up to 10,000m2, 200mm thick over 10,000m2 GIA; Steel Portal frame with bolts and baseplates; Coated galvanised trapezoidal roof sheets with insulation on steel purlins; Roof lights; valley gutters; matching fascia and soffit; Rainwater downpipes and gutters; trapezoidal insulated wall system cladding on cladding rails; External roller shutter doors and personnel doors; Single phase electrics, lighting and power; Gas fuelled hot air burners; Under slab storm drainage from internal downpipes on building area greater than 1,000m2;

Referencing details: -

Cost information notes: The data consists of a typical Industrial shell. Works include the Industrial shell as described and includes works up to 1m perimeter to the building (1m wide paving slabs & foul/storm drainage), The cost include 2 no. personnel doors and roller shutters are included at 1 door up to 1,000m2 , 2 roller doors over 1,000m2 (GIA), and 4 roller doors over 5,000m2. Costs are for the shell only and do not include for internal rooms such as offices or toilets which should be added for separately. See Variations for assistance.

Non-rateable element: -

Adjusted plant and machinery: -

Number of items adjusted: -

Contract size adjustment: See Appendix BEAMS Note 2

Variations: If Cavity Wall construction to lower walls then measure relevant wall area and use code 41P1V1, single block walls are cost neutral. Additional roller shutter doors over and above the beacon specification should be added using code 41P1V2 . Additional personnel doors over the assumed 2no. - add Code 41P1V3. If heating is required an addition using code 41P1V4 (GIA) should be made to the beacon cost. Internal offices (in Industrial complexes) should be added by reference to Cost Guide code series 42P04A - 42P40V, Internal WC - 42P40W

Unit of measurement: m2

ERC: £715

Superseded codes: 41R22B ,41P80B, 41P34C

Location factor: Location Adjustment Applicable (See Guidance Notes) - ERC = UK mean of 1.00

Description: Building Area only; Site strip vegetation; Strip foundations; Column bases; Insulated Concrete GF slab with DPM and Mesh,150mm thick up to 10,000m2, 200mm thick over 10,000m2 GIA; Steel Portal frame with bolts and baseplates; Coated galvanised trapezoidal roof sheets with insulation on steel purlins; Roof lights; valley gutters; matching fascia and soffit; Rainwater downpipes and gutters; trapezoidal insulated wall system cladding on cladding rails; External roller shutter doors and personnel doors; Single phase electrics, lighting and power; Gas fuelled hot air burners; Under slab storm drainage from internal downpipes on building area greater than 1,000m2;

Referencing details: -

Cost information notes: The data consists of a typical Industrial shell. Works include the Industrial shell as described and includes works up to 1m perimeter to the building (1m wide paving slabs & foul/storm drainage), The cost include 2 no. personnel doors and roller shutters are included at 1 door up to 1,000m2 , 2 roller doors over 1,000m2 (GIA), and 4 roller doors over 5,000m2. Costs are for the shell only and do not include for internal rooms such as offices or toilets which should be added for separately. See Variations for assistance.

Rateable element: -

Non-rateable element: -

Adjusted plant and machinery: -

Number of items adjusted: -

Contract size adjustment: See Appendix BEAMS Note 2

Variations: If Cavity Wall construction to lower walls then measure relevant wall area and use code 41P1V1, single block walls are cost neutral. Additional roller shutter doors over and above the beacon specification should be added using code 41P1V2 . Additional personnel doors over the assumed 2no. - add Code 41P1V3. If heating is required an addition using code 41P1V4 (GIA) should be made to the beacon cost. Internal offices (in Industrial complexes) should be added by reference to Cost Guide code series 42P04A - 42P40V, Internal WC - 42P40W

Variations: If Cavity Wall construction to lower walls then measure relevant wall area and use code 41P1V1, single block walls are cost neutral. Additional roller shutter doors over and above the beacon specification should be added using code 41P1V2 . Additional personnel doors over the assumed 2no. - add Code 41P1V3. If heating is required an addition using code 41P1V4 (GIA) should be made to the beacon cost. Internal offices (in Industrial complexes) should be added by reference to Cost Guide code series 42P04A - 42P40V, Internal WC - 42P40W

Industrial Buildings

CG Code: 41P732

Specific: Insulated Buildings

Descriptive: Sheet Metal Cladding

Tech 1: 251 - 500m2

Tech 2: Eaves Height - 23m

Unit size: -

Unit of measurement: m2

ERC: £1,181

Superseded codes: 41P81X, 41P425

Location factor: Location Adjustment Applicable (See Guidance Notes) - ERC = UK mean of 1.00

Description: Building Area only; Site strip vegetation; Strip foundations; Column bases; Insulated Concrete GF slab with DPM and Mesh,150mm thick up to 10,000m2, 200mm thick over 10,000m2 GIA; Steel Portal frame with bolts and baseplates; Coated galvanised trapezoidal roof sheets with insulation on steel purlins; Roof lights; valley gutters; matching fascia and soffit; Rainwater downpipes and gutters; trapezoidal insulated wall system cladding on cladding rails; External roller shutter doors and personnel doors; Single phase electrics, lighting and power; Gas fuelled hot air burners; Under slab storm drainage from internal downpipes on building area greater than 1,000m2;

Referencing details: -

Cost information notes: The data consists of a typical Industrial shell. Works include the Industrial shell as described and includes works up to 1m perimeter to the building (1m wide paving slabs & foul/storm drainage), The cost include 2 no. personnel doors and roller shutters are included at 1 door up to 1,000m2 , 2 roller doors over 1,000m2 (GIA), and 4 roller doors over 5,000m2. Costs are for the shell only and do not include for internal rooms such as offices or toilets which should be added for separately. See Variations for assistance.

Cost information notes: The data consists of a typical Industrial shell. Works include the Industrial shell as described and includes works up to 1m perimeter to the building (1m wide paving slabs & foul/storm drainage), The cost include 2 no. personnel doors and roller shutters are included at 1 door up to 1,000m2 , 2 roller doors over 1,000m2 (GIA), and 4 roller doors over 5,000m2. Costs are for the shell only and do not include for internal rooms such as offices or toilets which should be added for separately. See Variations for assistance.

Rateable element: -

Non-rateable element: -

Adjusted plant and machinery: -

Number of items adjusted: -

Contract size adjustment: See Appendix BEAMS Note 2

Variations: If Cavity Wall construction to lower walls then measure relevant wall area and use code 41P1V1, single block walls are cost neutral. Additional roller shutter doors over and above the beacon specification should be added using code 41P1V2 . Additional personnel doors over the assumed 2no. - add Code 41P1V3. If heating is required an addition using code 41P1V4 (GIA) should be made to the beacon cost. Internal offices (in Industrial complexes) should be added by reference to Cost Guide code series 42P04A - 42P40V, Internal WC - 42P40W

Industrial Buildings

Description: Building Area only; Site strip vegetation; Strip foundations; Column bases; Insulated Concrete GF slab with DPM and Mesh,150mm thick up to 10,000m2, 200mm thick over 10,000m2 GIA; Steel Portal frame with bolts and baseplates; Coated galvanised trapezoidal roof sheets with insulation on steel purlins; Roof lights; valley gutters; matching fascia and soffit; Rainwater downpipes and gutters; trapezoidal insulated wall system cladding on cladding rails; External roller shutter doors and personnel doors; Single phase electrics, lighting and power; Gas fuelled hot air burners; Under slab storm drainage from internal downpipes on building area greater than 1,000m2;

Referencing details: -

Cost information notes: The data consists of a typical Industrial shell. Works include the Industrial shell as described and includes works up to 1m perimeter to the building (1m wide paving slabs & foul/storm drainage), The cost include 2 no. personnel doors and roller shutters are included at 1 door up to 1,000m2 , 2 roller doors over 1,000m2 (GIA), and 4 roller doors over 5,000m2. Costs are for the shell only and do not include for internal rooms such as offices or toilets which should be added for separately. See Variations for assistance.

CG Code: 41P76L

Specific: Insulated Buildings

Descriptive: Sheet Metal Cladding

Tech 1: 5,001 - 10,000m2

Tech 2: Eaves Height - 7m

Unit size: -

Unit of measurement: m2

ERC: £667

Superseded codes: 41R28L, 41P86L, 41P38R

Location factor: Location Adjustment Applicable (See Guidance Notes) - ERC = UK mean of 1.00

Description: Building Area only; Site strip vegetation; Strip foundations; Column bases; Insulated Concrete GF slab with DPM and Mesh,150mm thick up to 10,000m2, 200mm thick over 10,000m2 GIA; Steel Portal frame with bolts and baseplates; Coated galvanised trapezoidal roof sheets with insulation on steel purlins; Roof lights; valley gutters; matching fascia and soffit; Rainwater downpipes and gutters; trapezoidal insulated wall system cladding on cladding rails; External roller shutter doors and personnel doors; Single phase electrics, lighting and power; Gas fuelled hot air burners; Under slab storm drainage from internal downpipes on building area greater than 1,000m2;

Referencing details: -

Cost information notes: The data consists of a typical Industrial shell. Works include the Industrial shell as described and includes works up to 1m perimeter to the building (1m wide paving slabs & foul/storm drainage), The cost include 2 no. personnel doors and roller shutters are included at 1 door up to 1,000m2 , 2 roller doors over 1,000m2 (GIA), and 4 roller doors over 5,000m2. Costs are for the shell only and do not include for internal rooms such as offices or toilets which should be added for separately. See Variations for assistance.

Rateable element: -

Non-rateable element: -

Adjusted plant and machinery: -

Number of items adjusted: -

Contract size adjustment: See Appendix BEAMS Note 2

Variations: If Cavity Wall construction to lower walls then measure relevant wall area and use code 41P1V1, single block walls are cost neutral. Additional roller shutter doors over and above the beacon specification should be added using code 41P1V2 . Additional personnel doors over the assumed 2no. - add Code 41P1V3. If heating is required an addition using code 41P1V4 (GIA) should be made to the beacon cost. Internal offices (in Industrial complexes) should be added by reference to Cost Guide code series 42P04A - 42P40V, Internal WC - 42P40W

Adjusted plant and machinery: -

Number of items adjusted: -

Contract size adjustment: See Appendix BEAMS Note 2

Variations: If Cavity Wall construction to lower walls then measure relevant wall area and use code 41P1V1, single block walls are cost neutral. Additional roller shutter doors over and above the beacon specification should be added using code 41P1V2 . Additional personnel doors over the assumed 2no. - add Code 41P1V3. If heating is required an addition using code 41P1V4 (GIA) should be made to the beacon cost. Internal offices (in Industrial complexes) should be added by reference to Cost Guide code series 42P04A - 42P40V, Internal WC - 42P40W

Industrial Buildings

CG Code: 41P77T

Specific: Insulated Buildings

Descriptive: Sheet Metal Cladding

Tech 1: 5,001 - 10,000m2

Tech 2: Eaves Height - 12m

Unit size: -

Unit of measurement: m2

ERC: £696

Superseded codes: 41R29F, 41P87F, 41P39T

Location factor: Location Adjustment Applicable (See Guidance Notes) - ERC = UK mean of 1.00

Description: Building Area only; Site strip vegetation; Strip foundations; Column bases; Insulated Concrete GF slab with DPM and Mesh,150mm thick up to 10,000m2, 200mm thick over 10,000m2 GIA; Steel Portal frame with bolts and baseplates; Coated galvanised trapezoidal roof sheets with insulation on steel purlins; Roof lights; valley gutters; matching fascia and soffit; Rainwater downpipes and gutters; trapezoidal insulated wall system cladding on cladding rails; External roller shutter doors and personnel doors; Single phase electrics, lighting and power; Gas fuelled hot air burners; Under slab storm drainage from internal downpipes on building area greater than 1,000m2;

Referencing details: -

Cost information notes: The data consists of a typical Industrial shell. Works include the Industrial shell as described and includes works up to 1m perimeter to the building (1m wide paving slabs & foul/storm drainage), The cost include 2 no. personnel doors and roller shutters are included at 1 door up to 1,000m2 , 2 roller doors over 1,000m2 (GIA), and 4 roller doors over 5,000m2. Costs are for the shell only and do not include for internal rooms such as offices or toilets which should be added for separately. See Variations for assistance.

Cost information notes: The data consists of a typical Industrial shell. Works include the Industrial shell as described and includes works up to 1m perimeter to the building (1m wide paving slabs & foul/storm drainage), The cost include 2 no. personnel doors and roller shutters are included at 1 door up to 1,000m2 , 2 roller doors over 1,000m2 (GIA), and 4 roller doors over 5,000m2. Costs are for the shell only and do not include for internal rooms such as offices or toilets which should be added for separately. See Variations for assistance.

Non-rateable element: -

Adjusted plant and machinery: -

Number of items adjusted: -

Contract size adjustment: See Appendix BEAMS Note 2

Variations: If Cavity Wall construction to lower walls then measure relevant wall area and use code 41P1V1, single block walls are cost neutral. Additional roller shutter doors over and above the beacon specification should be added using code 41P1V2 . Additional personnel doors over the assumed 2no. - add Code 41P1V3. If heating is required an addition using code 41P1V4 (GIA) should be made to the beacon cost. Internal offices (in Industrial complexes) should be added by reference to Cost Guide code series 42P04A - 42P40V, Internal WC - 42P40W

Description: Building Area only; Site strip vegetation; Strip foundations; Column bases; Insulated Concrete GF slab with DPM and Mesh,150mm thick up to 10,000m2, 200mm thick over 10,000m2 GIA; Steel Portal frame with bolts and baseplates; Coated galvanised trapezoidal roof sheets with insulation on steel purlins; Roof lights; valley gutters; matching fascia and soffit; Rainwater downpipes and gutters; trapezoidal insulated wall system cladding on cladding rails; External roller shutter doors and personnel doors; Single phase electrics, lighting and power; Gas fuelled hot air burners; Under slab storm drainage from internal downpipes on building area greater than 1,000m2;

Referencing details: -

Cost information notes: The data consists of a typical Industrial shell. Works include the Industrial shell as described and includes works up to 1m perimeter to the building (1m wide paving slabs & foul/storm drainage), The cost include 2 no. personnel doors and roller shutters are included at 1 door up to 1,000m2 , 2 roller doors over 1,000m2 (GIA), and 4 roller doors over 5,000m2. Costs are for the shell only and do not include for internal rooms such as offices or toilets which should be added for separately. See Variations for assistance.

Rateable element: -

Non-rateable element: -

Adjusted plant and machinery: -

Number of items adjusted: -

Contract size adjustment: See Appendix BEAMS Note 2

Variations: If Cavity Wall construction to lower walls then measure relevant wall area and use code 41P1V1, single block walls are cost neutral. Additional roller shutter doors over and above the beacon specification should be added using code 41P1V2 . Additional personnel doors over the assumed 2no. - add Code 41P1V3. If heating is required an addition using code 41P1V4 (GIA) should be made to the beacon cost. Internal offices (in Industrial complexes) should be added by reference to Cost Guide code series 42P04A - 42P40V, Internal WC - 42P40W

Additional roller shutter doors over and above the beacon specification should be added using code 41P1V2 . Additional personnel doors over the assumed 2no. - add Code 41P1V3. If heating is required an addition using code 41P1V4 (GIA) should be made to the beacon cost. Internal offices (in Industrial complexes) should be added by reference to Cost Guide code series 42P04A - 42P40V, Internal WC - 42P40W

Industrial Buildings

CG Code: 41P74M

Specific: Insulated Buildings

Descriptive: Sheet Metal Cladding

Tech 1: 501 - 1,000m2

Tech 2: Eaves Height - 7.5m

Unit size: -

Unit of measurement: m2

ERC: £691

Superseded codes: 41P82M, 41R24M, 41P36T

Location factor: Location Adjustment Applicable (See Guidance Notes) - ERC = UK mean of 1.00

Description: Building Area only; Site strip vegetation; Strip foundations; Column bases; Insulated Concrete GF slab with DPM and Mesh,150mm thick up to 10,000m2, 200mm thick over 10,000m2 GIA; Steel Portal frame with bolts and baseplates; Coated galvanised trapezoidal roof sheets with insulation on steel purlins; Roof lights; valley gutters; matching fascia and soffit; Rainwater downpipes and gutters; trapezoidal insulated wall system cladding on cladding rails; External roller shutter doors and personnel doors; Single phase electrics, lighting and power; Gas fuelled hot air burners; Under slab storm drainage from internal downpipes on building area greater than 1,000m2;

Referencing details: -

Cost information notes: The data consists of a typical Industrial shell. Works include the Industrial shell as described and includes works up to 1m perimeter to the building (1m wide paving slabs & foul/storm drainage), The cost include 2 no. personnel doors and roller shutters are included at 1 door up to 1,000m2 , 2 roller doors over 1,000m2 (GIA), and 4 roller doors over 5,000m2. Costs are for the shell only and do not include for internal rooms such as offices or toilets which should be added for separately. See Variations for assistance.

Rateable element: -

Non-rateable element: -

Adjusted plant and machinery: -

Number of items adjusted: -

Contract size adjustment: See Appendix BEAMS Note 2

Variations: If Cavity Wall construction to lower walls then measure relevant wall area and use code 41P1V1, single block walls are cost neutral. Additional roller shutter doors over and above the beacon specification should be added using code 41P1V2 . Additional personnel doors over the assumed 2no. - add Code 41P1V3. If heating is required an addition using code 41P1V4 (GIA) should be made to the beacon cost. Internal offices (in Industrial complexes) should be added by reference to Cost Guide code series 42P04A - 42P40V, Internal WC - 42P40W

Cost information notes: The data consists of a typical Industrial shell. Works include the Industrial shell as described and includes works up to 1m perimeter to the building (1m wide paving slabs & foul/storm drainage), The cost include 2 no. personnel doors and roller shutters are included at 1 door up to 1,000m2 , 2 roller doors over 1,000m2 (GIA), and 4 roller doors over 5,000m2. Costs are for the shell only and do not include for internal rooms such as offices or toilets which should be added for separately. See Variations for assistance.

Rateable element: -

Non-rateable element: -

Adjusted plant and machinery: -

Number of items adjusted: -

Contract size adjustment: See Appendix BEAMS Note 2

Variations: If Cavity Wall construction to lower walls then measure relevant wall area and use code 41P1V1, single block walls are cost neutral. Additional roller shutter doors over and above the beacon specification should be added using code 41P1V2 . Additional personnel doors over the assumed 2no. - add Code 41P1V3. If heating is required an addition using code 41P1V4 (GIA) should be made to the beacon cost. Internal offices (in Industrial complexes) should be added by reference to Cost Guide code series 42P04A - 42P40V, Internal WC - 42P40W

Industrial Buildings

CG Code: 41P75A

Specific: Insulated Buildings

Descriptive: Sheet Metal Cladding

Tech 1: 501 - 1,000m2

Tech 2: Eaves Height - 9m

Unit size: -

Superseded codes: 41P93E, 41P458

Location factor: Location Adjustment Applicable (See Guidance Notes) - ERC = UK mean of 1.00

Description: Building Area only; Site strip vegetation; Strip foundations; Column bases; Insulated Concrete GF slab with DPM and Mesh,150mm thick up to 10,000m2, 200mm thick over 10,000m2 GIA; Steel Portal frame with bolts and baseplates; Coated galvanised trapezoidal roof sheets with insulation on steel purlins; Roof lights; valley gutters; matching fascia and soffit; Rainwater downpipes and gutters; trapezoidal insulated wall system cladding on cladding rails; External roller shutter doors and personnel doors; Single phase electrics, lighting and power; Gas fuelled hot air burners; Under slab storm drainage from internal downpipes on building area greater than 1,000m2;

Referencing details: -

Cost information notes: The data consists of a typical Industrial shell. Works include the Industrial shell as described and includes works up to 1m perimeter to the building (1m wide paving slabs & foul/storm drainage), The cost include 2 no. personnel doors and roller shutters are included at 1 door up to 1,000m2 , 2 roller doors over 1,000m2 (GIA), and 4 roller doors over 5,000m2. Costs are for the shell only and do not include for internal rooms such as offices or toilets which should be added for separately. See Variations for assistance.

Rateable element: -

Non-rateable element: -

Adjusted plant and machinery: -

Number of items adjusted: -

Contract size adjustment: See Appendix BEAMS Note 2

Variations: If Cavity Wall construction to lower walls then measure relevant wall area and use code 41P1V1, single block walls are cost neutral. Additional roller shutter doors over and above the beacon specification should be added using code 41P1V2 . Additional personnel doors over the assumed 2no. - add Code 41P1V3. If heating is required an addition using code 41P1V4 (GIA) should be made to the beacon cost. Internal offices (in Industrial complexes) should be added by reference to Cost Guide code series 42P04A - 42P40V, Internal WC - 42P40W

ERC: £1,253

Superseded codes: -

Location factor: Location Adjustment Applicable (See Guidance Notes) - ERC = UK mean of 1.00

Description: Building Area only; Site strip vegetation; Strip foundations; Column bases; Insulated Concrete GF slab with DPM and Mesh,150mm thick up to 10,000m2, 200mm thick over 10,000m2 GIA; Steel Portal frame with bolts and baseplates; Coated galvanised trapezoidal roof sheets with insulation on steel purlins; Roof lights; valley gutters; matching fascia and soffit; Rainwater downpipes and gutters; trapezoidal insulated wall system cladding on cladding rails; External roller shutter doors and personnel doors; Single phase electrics, lighting and power; Gas fuelled hot air burners; Under slab storm drainage from internal downpipes on building area greater than 1,000m2;

Referencing details: -

Cost information notes: The data consists of a typical Industrial shell. Works include the Industrial shell as described and includes works up to 1m perimeter to the building (1m wide paving slabs & foul/storm drainage), The cost include 2 no. personnel doors and roller shutters are included at 1 door up to 1,000m2 , 2 roller doors over 1,000m2 (GIA), and 4 roller doors over 5,000m2. Costs are for the shell only and do not include for internal rooms such as offices or toilets which should be added for separately. See Variations for assistance.

Rateable element: -

Non-rateable element: -

Adjusted plant and machinery: -

Number of items adjusted: -

Contract size adjustment: See Appendix BEAMS Note 2

Variations: If Cavity Wall construction to lower walls then measure relevant wall area and use code 41P1V1, single block walls are cost neutral. Additional roller shutter doors over and above the beacon specification should be added using code 41P1V2 . Additional personnel doors over the assumed 2no. - add Code 41P1V3. If heating is required an addition using code 41P1V4 (GIA) should be made to the beacon cost. Internal offices (in Industrial complexes) should be added by reference to Cost Guide code series 42P04A - 42P40V, Internal WC - 42P40W

Description: Building Area only; Site strip vegetation; Strip foundations; Column bases; Insulated Concrete GF slab with DPM and Mesh,150mm thick up to 10,000m2, 200mm thick over 10,000m2 GIA; Steel Portal frame with bolts and baseplates; Coated galvanised trapezoidal roof sheets with insulation on steel purlins; Roof lights; valley gutters; matching fascia and soffit; Rainwater downpipes and gutters; trapezoidal insulated wall system cladding on cladding rails; External roller shutter doors and personnel doors; Single phase electrics, lighting and power; Gas fuelled hot air burners; Under slab storm drainage from internal downpipes on building area greater than 1,000m2;

Referencing details: -

Cost information notes: The data consists of a typical Industrial shell. Works include the Industrial shell as described and includes works up to 1m perimeter to the building (1m wide paving slabs & foul/storm drainage), The cost include 2 no. personnel doors and roller shutters are included at 1 door up to 1,000m2 , 2 roller doors over 1,000m2 (GIA), and 4 roller doors over 5,000m2. Costs are for the shell only and do not include for internal rooms such as offices or toilets which should be added for separately. See Variations for assistance.

Rateable element: -

Non-rateable element: -

Adjusted plant and machinery: -

Number of items adjusted: -

Contract size adjustment: See Appendix BEAMS Note 2

Variations: If Cavity Wall construction to lower walls then measure relevant wall area and use code 41P1V1, single block walls are cost neutral. Additional roller shutter doors over and above the beacon specification should be added using code 41P1V2 . Additional personnel doors over the assumed 2no. - add Code 41P1V3. If heating is required an addition using code 41P1V4 (GIA) should be made to the beacon cost. Internal offices (in Industrial complexes) should be added by reference to Cost Guide code series 42P04A - 42P40V, Internal WC - 42P40W

Superseded codes: 41P30G

Location factor: Location Adjustment Applicable (See Guidance Notes) - ERC = UK mean of 1.00

Description: Building Area only; Site strip vegetation; Strip foundations; Column bases; Insulated Concrete GF slab with DPM and Mesh,150mm thick up to 10,000m2, 200mm thick over 10,000m2 GIA; Steel Portal frame with bolts and baseplates; Coated galvanised trapezoidal roof sheets with insulation on steel purlins; Roof lights; valley gutters; matching fascia and soffit; Rainwater downpipes and gutters; trapezoidal insulated wall system cladding on cladding rails; External roller shutter doors and personnel doors; Single phase electrics, lighting and power; Gas fuelled hot air burners; Under slab storm drainage from internal downpipes on building area greater than 1,000m2;

Referencing details: -

Cost information notes: The data consists of a typical Industrial shell. Works include the Industrial shell as described and includes works up to 1m perimeter to the building (1m wide paving slabs & foul/storm drainage), The cost include 2 no. personnel doors and roller shutters are included at 1 door up to 1,000m2 , 2 roller doors over 1,000m2 (GIA), and 4 roller doors over 5,000m2. Costs are for the shell only and do not include for internal rooms such as offices or toilets which should be added for separately. See Variations for assistance.

Rateable element: -

Non-rateable element: -

Adjusted plant and machinery: -

Number of items adjusted: -

Contract size adjustment: See Appendix BEAMS Note 2

Variations: If Cavity Wall construction to lower walls then measure relevant wall area and use code 41P1V1, single block walls are cost neutral. Additional roller shutter doors over and above the beacon specification should be added using code 41P1V2 . Additional personnel doors over the assumed 2no. - add Code 41P1V3. If heating is required an addition using code 41P1V4 (GIA) should be made to the beacon cost. Internal offices (in Industrial complexes) should be added by reference to Cost Guide code series 42P04A - 42P40V, Internal WC - 42P40W

Superseded codes: 41P31P

Location factor: Location Adjustment Applicable (See Guidance Notes) - ERC = UK mean of 1.00

Description: Building Area only; Site strip vegetation; Strip foundations; Column bases; Insulated Concrete GF slab with DPM and Mesh,150mm thick up to 10,000m2, 200mm thick over 10,000m2 GIA; Steel Portal frame with bolts and baseplates; Coated galvanised trapezoidal roof sheets with insulation on steel purlins; Roof lights; valley gutters; matching fascia and soffit; Rainwater downpipes and gutters; trapezoidal insulated wall system cladding on cladding rails; External roller shutter doors and personnel doors; Single phase electrics, lighting and power; Gas fuelled hot air burners; Under slab storm drainage from internal downpipes on building area greater than 1,000m2;

Referencing details: -

Cost information notes: The data consists of a typical Industrial shell. Works include the Industrial shell as described and includes works up to 1m perimeter to the building (1m wide paving slabs & foul/storm drainage), The cost include 2 no. personnel doors and roller shutters are included at 1 door up to 1,000m2 , 2 roller doors over 1,000m2 (GIA), and 4 roller doors over 5,000m2. Costs are for the shell only and do not include for internal rooms such as offices or toilets which should be added for separately. See Variations for assistance.

Rateable element: -

Non-rateable element: -

Adjusted plant and machinery: -

Number of items adjusted: -

Contract size adjustment: See Appendix BEAMS Note 2

Variations: If Cavity Wall construction to lower walls then measure relevant wall area and use code 41P1V1, single block walls are cost neutral. Additional roller shutter doors over and above the beacon specification should be added using code 41P1V2 . Additional personnel doors over the assumed 2no. - add Code 41P1V3. If heating is required an addition using code 41P1V4 (GIA) should be made to the beacon cost. Internal offices (in Industrial complexes) should be added by reference to Cost Guide code series 42P04A - 42P40V, Internal WC - 42P40W

Description: Building Area only; Site strip vegetation; Strip foundations; Column bases; Insulated Concrete GF slab with DPM and Mesh,150mm thick up to 10,000m2, 200mm thick over 10,000m2 GIA; Steel Portal frame with bolts and baseplates; Coated galvanised trapezoidal roof sheets with insulation on steel purlins; Roof lights; valley gutters; matching fascia and soffit; Rainwater downpipes and gutters; trapezoidal insulated wall system cladding on cladding rails; External roller shutter doors and personnel doors; Single phase electrics, lighting and power; Gas fuelled hot air burners; Under slab storm drainage from internal downpipes on building area greater than 1,000m2;

Referencing details: -

Cost information notes: The data consists of a typical Industrial shell. Works include the Industrial shell as described and includes works up to 1m perimeter to the building (1m wide paving slabs & foul/storm drainage), The cost include 2 no. personnel doors and roller shutters are included at 1 door up to 1,000m2 , 2 roller doors over 1,000m2 (GIA), and 4 roller doors over 5,000m2. Costs are for the shell only and do not include for internal rooms such as offices or toilets which should be added for separately. See Variations for assistance.

Rateable element: -

Non-rateable element: -

Adjusted plant and machinery: -

Number of items adjusted: -

Contract size adjustment: See Appendix BEAMS Note 2

Variations: If Cavity Wall construction to lower walls then measure relevant wall area and use code 41P1V1, single block walls are cost neutral. Additional roller shutter doors over and above the beacon specification should be added using code 41P1V2 . Additional personnel doors over the assumed 2no. - add Code 41P1V3. If heating is required an addition using code 41P1V4 (GIA) should be made to the beacon cost. Internal offices (in Industrial complexes) should be added by reference to Cost Guide code series 42P04A - 42P40V, Internal WC - 42P40W

Description: Building Area only; Site strip vegetation; Strip foundations; Column bases; Insulated Concrete GF slab with DPM and Mesh,150mm thick up to 10,000m2, 200mm thick over 10,000m2 GIA; Steel Portal frame with bolts and baseplates; Coated galvanised trapezoidal roof sheets with insulation on steel purlins; Roof lights; valley gutters; matching fascia and soffit; Rainwater downpipes and gutters; trapezoidal insulated wall system cladding on cladding rails; External roller shutter doors and personnel doors; Single phase electrics, lighting and power; Gas fuelled hot air burners; Under slab storm drainage from internal downpipes on building area greater than 1,000m2;

Referencing details: -

Cost information notes: The data consists of a typical Industrial shell. Works include the Industrial shell as described and includes works up to 1m perimeter to the building (1m wide paving slabs & foul/storm drainage), The cost include 2 no. personnel doors and roller shutters are included at 1 door up to 1,000m2 , 2 roller doors over 1,000m2 (GIA), and 4 roller doors over 5,000m2. Costs are for the shell only and do not include for internal rooms such as offices or toilets which should be added for separately. See Variations for assistance.

Rateable element: -

Non-rateable element: -

Adjusted plant and machinery: -

Number of items adjusted: -

Contract size adjustment: See Appendix BEAMS Note 2

Variations: If Cavity Wall construction to lower walls then measure relevant wall area and use code 41P1V1, single block walls are cost neutral. Additional roller shutter doors over and above the beacon specification should be added using code 41P1V2 . Additional personnel doors over the assumed 2no. - add Code 41P1V3. If heating is required an addition using code 41P1V4 (GIA) should be made to the beacon cost. Internal offices (in Industrial complexes) should be added by reference to Cost Guide code series 42P04A - 42P40V, Internal WC - 42P40W

Description: Building Area only; Site strip vegetation; Strip foundations; Column bases; Insulated Concrete GF slab with DPM and Mesh,150mm thick up to 10,000m2, 200mm thick over 10,000m2 GIA; Steel Portal frame with bolts and baseplates; Coated galvanised trapezoidal roof sheets with insulation on steel purlins; Roof lights; valley gutters; matching fascia and soffit; Rainwater downpipes and gutters; trapezoidal insulated wall system cladding on cladding rails; External roller shutter doors and personnel doors; Single phase electrics, lighting and power; Gas fuelled hot air burners; Under slab storm drainage from internal downpipes on building area greater than 1,000m2;

Referencing details: -

Cost information notes: The data consists of a typical Industrial shell. Works include the Industrial shell as described and includes works up to 1m perimeter to the building (1m wide paving slabs & foul/storm drainage), The cost include 2 no. personnel doors and roller shutters are included at 1 door up to 1,000m2 , 2 roller doors over 1,000m2 (GIA), and 4 roller doors over 5,000m2. Costs are for the shell only and do not include for internal rooms such as offices or toilets which should be added for separately. See Variations for assistance.

Rateable element: -

Non-rateable element: -

Adjusted plant and machinery: -

Number of items adjusted: -

Contract size adjustment: See Appendix BEAMS Note 2

Variations: If Cavity Wall construction to lower walls then measure relevant wall area and use code 41P1V1, single block walls are cost neutral. Additional roller shutter doors over and above the beacon specification should be added using code 41P1V2 . Additional personnel doors over the assumed 2no. - add Code 41P1V3. If heating is required an addition using code 41P1V4 (GIA) should be made to the beacon cost. Internal offices (in Industrial complexes) should be added by reference to Cost Guide code series 42P04A - 42P40V, Internal WC - 42P40W

Description: Building Area only; Site strip vegetation; Strip foundations; Column bases; Insulated Concrete GF slab with DPM and Mesh,150mm thick up to 10,000m2, 200mm thick over 10,000m2 GIA; Steel Portal frame with bolts and baseplates; Coated galvanised trapezoidal roof sheets with insulation on steel purlins; Roof lights; valley gutters; matching fascia and soffit; Rainwater downpipes and gutters; trapezoidal insulated wall system cladding on cladding rails; External roller shutter doors and personnel doors; Single phase electrics, lighting and power; Gas fuelled hot air burners; Under slab storm drainage from internal downpipes on building area greater than 1,000m2;

Referencing details: -

Cost information notes: The data consists of a typical Industrial shell. Works include the Industrial shell as described and includes works up to 1m perimeter to the building (1m wide paving slabs & foul/storm drainage), The cost include 2 no. personnel doors and roller shutters are included at 1 door up to 1,000m2 , 2 roller doors over 1,000m2 (GIA), and 4 roller doors over 5,000m2. Costs are for the shell only and do not include for internal rooms such as offices or toilets which should be added for separately. See Variations for assistance.

Rateable element: -

Non-rateable element: -

Adjusted plant and machinery: -

Number of items adjusted: -

Contract size adjustment: See Appendix BEAMS Note 2

Variations: If Cavity Wall construction to lower walls then measure relevant wall area and use code 41P1V1, single block walls are cost neutral. Additional roller shutter doors over and above the beacon specification should be added using code 41P1V2 . Additional personnel doors over the assumed 2no. - add Code 41P1V3. If heating is required an addition using code 41P1V4 (GIA) should be made to the beacon cost. Internal offices (in Industrial complexes) should be added by reference to Cost Guide code series 42P04A - 42P40V, Internal WC - 42P40W

Contract size adjustment: See Appendix BEAMS Note 2

Variations: If heating is required an addition using code 41P1V4 (GIA) should be made to the beacon cost. Internal offices (in Industrial complexes) should be added by reference to Cost Guide code series 42P04A - 42P40V, Internal WC - 42P40W

Industrial Buildings

CG Code: 42A12G

Specific: No Wall Cladding

Descriptive: 1,001 - 5,000m2

Tech 1: Eaves Height - 4m

Tech 2: -

Unit size: -

Unit of measurement: m2

ERC: £542

Superseded codes: -

Location factor: Location Adjustment Applicable (See Guidance Notes) - ERC = UK mean of 1.00

Description: Building Area only; Site strip vegetation; Strip foundations; Column bases; Uninsulated Concrete GF slab with DPM and Mesh,150mm thick up to 10,000m2, 200mm thick over 10,000m2 GIA; Steel Portal frame with bolts and baseplates; Coated galvanised trapezoidal roof sheets with no insulation, on steel purlins; Roof lights; valley gutters; matching fascia and soffit; Rainwater downpipes and gutters; Single phase electrics, lighting and power; EXCLUDES heating ; Under slab storm drainage from internal downpipes on building area greater than 1,000m2

Referencing details: -

Cost information notes: The data consists of a typical Industrial shell. Works include the Industrial shell as described and includes works up to 1m perimeter to the building (1m wide paving slabs & foul/storm drainage). Costs are for the shell only and do not include for internal rooms such as offices or toilets which should be added for separately. See Variations for assistance.

Description: Building Area only; Site strip vegetation; Strip foundations; Column bases; Uninsulated Concrete GF slab with DPM and Mesh,150mm thick up to 10,000m2, 200mm thick over 10,000m2 GIA; Steel Portal frame with bolts and baseplates; Coated galvanised trapezoidal roof sheets with no insulation, on steel purlins; Roof lights; valley gutters; matching fascia and soffit; Rainwater downpipes and gutters; Single phase electrics, lighting and power; EXCLUDES heating ; Under slab storm drainage from internal downpipes on building area greater than 1,000m2

Referencing details: -

Cost information notes: The data consists of a typical Industrial shell. Works include the Industrial shell as described and includes works up to 1m perimeter to the building (1m wide paving slabs & foul/storm drainage). Costs are for the shell only and do not include for internal rooms such as offices or toilets which should be added for separately. See Variations for assistance.

Unit of measurement: m2

ERC: £545

Superseded codes: -

Location factor: Location Adjustment Applicable (See Guidance Notes) - ERC = UK mean of 1.00

Description: Building Area only; Site strip vegetation; Strip foundations; Column bases; Uninsulated Concrete GF slab with DPM and Mesh,150mm thick up to 10,000m2, 200mm thick over 10,000m2 GIA; Steel Portal frame with bolts and baseplates; Coated galvanised trapezoidal roof sheets with no insulation, on steel purlins; Roof lights; valley gutters; matching fascia and soffit; Rainwater downpipes and gutters; Single phase electrics, lighting and power; EXCLUDES heating ; Under slab storm drainage from internal downpipes on building area greater than 1,000m2

Referencing details: -

Cost information notes: The data consists of a typical Industrial shell. Works include the Industrial shell as described and includes works up to 1m perimeter to the building (1m wide paving slabs & foul/storm drainage). Costs are for the shell only and do not include for internal rooms such as offices or toilets which should be added for separately. See Variations for assistance.

Rateable element: -

Non-rateable element: -

Adjusted plant and machinery: -

Number of items adjusted: -

Contract size adjustment: See Appendix BEAMS Note 2

Variations: If heating is required an addition using code 41P1V4 (GIA) should be made to the beacon cost. Internal offices (in Industrial complexes) should be added by reference to Cost Guide code series 42P04A - 42P40V, Internal WC - 42P40W

Cost information notes: The data consists of a typical Industrial shell. Works include the Industrial shell as described and includes works up to 1m perimeter to the building (1m wide paving slabs & foul/storm drainage). Costs are for the shell only and do not include for internal rooms such as offices or toilets which should be added for separately. See Variations for assistance.

Rateable element: -

Non-rateable element: -

Adjusted plant and machinery: -

Number of items adjusted: -

Contract size adjustment: See Appendix BEAMS Note 2

Variations: If heating is required an addition using code 41P1V4 (GIA) should be made to the beacon cost. Internal offices (in Industrial complexes) should be added by reference to Cost Guide code series 42P04A - 42P40V, Internal WC - 42P40W

Industrial Buildings

CG Code: 42A15J

Specific: No Wall Cladding
